Abstract- Now days E-banking has been a major concern for all developed and developing countries. Online banking became a major system in all banking transactions. And each day the online banking is being spread and new innovative ideas created that aims for facilitating and enhancing financial transactions of the customers in terms of speed, cost, transparency and comfort. Despite all its benefits still many societies' especially in developing countries unfamiliar and lack trust in dealing in online banking. This study aims to study the ability of Lebanese people as a case for emerging market to adapt and trust the online banking.

Index Terms- Online banking, Lebanon, challenges, customers, acceptance, gender, age, trust, technology

I. INTRODUCTION

E-banking or Internet banking is defined as the use of the Internet to deliver banking activities such as money transfer, paying bills, viewing current and savings account balance, paying mortgages and purchasing financial instruments and certificates of deposits (Chavan, 2013). E-payment is described as a means where business transactions are fulfilled electronic devices such as personal computers, telephones, and fax machines, Internet card payments and other electronic channels. The electronic communications used in e-banking includes Internet, e-mail, e-books, data base and mobile phones. Sarita Bahl (2012) stated that electronic banking or e-banking has existed for some time in the form of teller machines. It can be used to eliminate also any geographic distances between customer and bank branch. Electronic banking could also be considered as an opportunity for countries that are developing their financial systems to advance to the development stages. Customers in such countries might benefit from the banks' services and have a direct access on these services from banks abroad through wireless communication systems more rapidly than traditional wired communication network. The advanced computer and communication technologies as well as the accessibility of the internet helped to make it possible for everyone to do most of the banking transactions online without even stepping to any financial institute, in other words this leads to the emerging of e-banking. E-banking has been considered as a revolution in the banking industry. It was predicted previously that banks are like dinosaurs and should be replaced one day by microcomputers. This has pointed to the threats and challenges in the banking industry, letting bank to formulate the best strategic plans to win back their customers. Their main concern is the all technologies relating to computer and telecommunication. The industry realized that improving the customer service can be achieved through adopting new technologies. For instance, American banks have started their e-banking services in the early 1992. Banks realized that there were a significant number of customers who are willing to do e-banking. Hence, many banks that operated 24 hours/day have developed numerous e-banking applications that allow their customers to get benefits of these services such as transferring money among accounts, paying bills, checking account history, and downloading information about statements.

II. METHODOLOGY AND DATA

Our empirical test will detect how trust, privacy and security, perceived ease of use, and perceived usefulness impact the adoption of e-banking services by Lebanese bank's customers. To detect the impact of these variables, we will use multiple regressions. The descriptive statistics are used to detect the frequencies, means, medians, standard deviations, minimums, maximums, and correlation of regression variables. Multiple regressions will be performed to assess the strength of the research's empirical results.

1.1. Variables' Specifications and Expected Signs

Our research is based on a model called Technology Acceptance Model (TAM) which determines the factors that affect the users' acceptance of an information system. This model suggests that the acceptance of any new information system is determined by some beliefs drawn from the users' behaviors such as perceived ease of use (PEOU), perceived usefulness (PU), in addition to other variables that has impact on PU and PEOU such as trust and privacy and security. Therefore, the independent variables will be perceived ease of use, perceived usefulness, trust, and privacy and security, whereas the dependent variable will be the willingness of

Lebanese customers to use e-banking services. In our study, we will focus on how much perceived ease of use, perceived usefulness, trust, and privacy and security may affect the willingness of Lebanese customers to use e-banking services.

1.2. Data

The data was collected through a survey questionnaire shown in the Appendix distributed randomly to 140 respondents. Only 100 questionnaires were returned back.

1.3. Research Question

This study raises two questions:

- 1) What is the level of acceptance of the Lebanese customers to use e-banking services offered by the Lebanese banks?
- 2) What is the level of willingness of the Lebanese customers to share private information and credit card information through the internet?

III. FINDING AND RESULTS

a. Descriptive statistics

This section presents some summary statistics for the collected data

Table 1: Summary Statistics of Males and Females

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid F	41	41.0	41.0	41.0
M	59	59.0	59.0	100.0
Total	100	100.0	100.0	

Source: done by author

Table 1 presents that 59 out of 100 respondents are males while 41 out of 100 respondents are females. This means that 59 % of the respondents are 52 males while 41% of the respondents are females. So, the sample consists of more males than females.

Table 2: Summary statistics of age groups

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid 20-30	38	38.0	38.0	38.0
30-40	43	43.0	43.0	81.0
40-50	12	12.0	12.0	93.0
50-60	7	7.0	7.0	100.0
Total	100	100.0	100.0	

Source: done by author

Table 2 shows that the sample consists of four age groups: 20-30, 30-40, 40-50, and 50-60. The above bar chart presents that 38% of the sample falls in the age group 20-30, 43% falls in the age group 30-40, 12% falls in the age group 40-50, and only 7% of the sample falls in the age group 50-60. This means that the highest percentage is that of the age group 30-40, so most of the respondents are between the ages thirty and forty.

Table 3: Summary statistics of purchasing products through the web

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid 0	68	68.0	68.0	68.0
1	32	32.0	32.0	100.0
Total	100	100.0	100.0	

Notes: product purchasing is a dummy variable where: No= 0 and Yes= 1

Source: author's own work

Table 3 demonstrates the behavior of purchasing products through the internet. The results showed that 68% of the respondents haven't bought any products through the internet and their answers are represented by the value zero. On the other hand, only 32% of the respondents bought products through the internet and their answers are represented by the value 1. This could explain that Lebanese customers are not willing to make online shopping because they don't have enough trust to do that for many reasons. First, the Lebanese laws and regulations don't provide customers with the safety and security systems to do online shopping. They don't also provide safe solutions in case any online financial problems happen with the users. Second, the Lebanese customers themselves lack the strong backgrounds of using the internet for commerce in contrary with other customers in Europe or the United States, for instance, who are highly involved in the business to consumer (B2C) transactions.

Table 4: Summary statistics of having an Internet Bank Account

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid 0	48	48.0	48.0	48.0
1	52	52.0	52.0	100.0
Total	100	100.0	100.0	

Notes: having an internet bank account is a dummy variable where: No= 0 and Yes= 1

Source: author's own work

Table 4 presents the percentage of respondents who have an internet bank account and those who don't have an internet bank account. Results showed that 52% of the respondents do have an internet bank account and they are represented by the number 1(yes=1), while 48% of the respondents don't have an internet bank account and they are represented by the value zero (No=0). Many reasons were provided by respondents who don't have an internet bank account. Some of them mentioned that they concerned about privacy and security issues; some stated that they don't see any real value in having this type of account, and others claimed that they are not interested in using new systems and new technologies. Respondents who have internet bank accounts emphasized on the facilities provided by such online banking systems such as convenience (24 hours service, everywhere connectivity). The table below will explain more the reasons of choosing the internet bank accounts by Lebanese customers.

Table 5: Summary statistics of reasons for choosing e-banking services.

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid 0	25	25.0	48.1	48.1
1	2	2.0	3.8	51.9
2	2	2.0	3.8	55.8
3	22	22.0	42.3	98.1
4	1	1.0	1.9	100.0
Total	52	52.0	100.0	
Missing System	48	48.0		
Total	100	100.0		

Notes: 0= convenience (24 hours service, everywhere connectivity), 1= Curiosity, 2= low service charge, 3=easy to maintain my banking transaction activity, 4= other reasons. Source: done by the author

Source: author's own work

Table 5 presents the reasons for choosing e-banking services by Lebanese banks' customers. Out of 52 respondents who have internet bank accounts, 25 stated that they chose e-banking services for convenience issues that let users access their accounts wherever and whenever they are. Twenty two respondents chose e-banking services because they can easily maintain their banking transaction activities such as transferring funds between accounts, balance inquiry, paying bills and other services. In addition, two respondents chose e-banking services for curiosity reasons; two for the low service charge offered by these e-banking services, and only one respondent chose to use these services for unknown reasons. The above results show that the most important reasons for choosing online banking services is the ability of bank customers to access their accounts when and where they needed that saving their costs and time instead of waiting in question in banks for a long time.

Table 6: Summary statistics of online services adopted by Lebanese customers

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	0	12	12.0	23.1	23.1
	1	32	32.0	61.5	84.6
	2	7	7.0	13.5	98.1
	4	1	1.0	1.9	100.0
	Total	52	52.0	100.0	
Missing	System	48	48.0		
Total		100	100.0		

Notes: 0= pay bills, 1= balance inquiry, 2= transfer funds between accounts, 3=process payroll, 4=order check books.
Source: author's own work

Table 6 shows the different online features (services) used by Lebanese customers. Results showed that 12 users which forms about 23.1% of those who have an internet bank account use online banking to pay their bills and save time instead of going to the required places to pay these bills. In addition, 32 users out of 52 who have an internet bank account use online banking services to inquire balance for their accounts. They form 61.5% of online banking users. Moreover, 7 users (13.5%) use e-banking services to transfer funds between accounts while only one user (1.9%) use e-banking services to order check books, noticing that process payroll is a service that is not practiced by Lebanese customers. We concluded from the above results that most of the Lebanese customers use online banking services for checking their accounts and getting a balance inquiry only, which proves that users in Lebanon lack the motivation, confidence, and background that encourage them to use the internet for more valuable and effective reasons.

Table 7: Summary statistics of customers' satisfaction of online banking services

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	2	12	12.0	23.1	23.1
	3	26	26.0	50.0	73.1
	4	14	14.0	26.9	100.0
	Total	52	52.0	100.0	
Missing	System	48	48.0		
Total		100	100.0		

Notes: 0= very unsatisfied, 1= unsatisfied, 2= neutral, 3=satisfied, 4=very satisfied
Source: author's own work

Table 7 presents the percentages of satisfaction of e-banking services among Lebanese customers. Results showed that 50% of Lebanese customers who has an internet bank account are satisfied with the e-banking services they are using, while 26.9% are very satisfied with these services. On the other hand, 23% of the customers are neutral with these services which mean that they are not finding any added value when using such online services. But as table 7 showed previously that 61.5% of the customers use e-banking services for balance inquiry reasons, so users who stated that they are very satisfied with the online banking services are not practicing real online financial transactions, they are just checking their accounts from time to time rather than doing a real business through the internet.

Table 8: Descriptive statistics of variables

	N	Minimum	Maximum	Mean	Std. Deviation
Dep Willingness	100	.0	.8	.418	.2686
V1= Trust	100	.00	1.00	.3654	.42911
V2=privacy and security	100	1	7	2.12	1.781
V3=ease	100	.00	4.00	2.3846	.69186
V4=usefulness	100	.00	3.00	1.4110	.73430
Valid N (listwise)	100				

Source: author's own work

Table 8 presents the descriptive statistics of the dependent variable willingness of Lebanese customers to use online banking services as well as the descriptive statistics of the independent variables trust, privacy and security, perceived ease of use, and perceived usefulness. The dependent variable willingness shows a minimum value of zero and a maximum value of 0.8. The mean of the dependent variable is equal to 0.418 and the standard deviation is equal to 0.2686. As to the independent variable trust it shows a zero minimum value, a maximum value equal to 1, a mean equal to 0.3654, and a standard deviation equal to 0.42911.

The independent variable privacy and security shows a minimum value equal to 1, a maximum value equal to 7, a mean equal to 2.12, and a standard deviation equal to 1.781. The minimum value of the independent variable perceived ease of use is equal to zero, the maximum value is equal to 4, the mean is equal to 2.3846, and the standard deviation is equal to 0.69186. Finally, the minimum value of the independent variable perceived usefulness is equal to zero, the maximum value is equal to 3, the mean is equal to 1.4110 and the standard deviation is equal to 0.73430.

1.4. Correlation and Regression Analysis

Table 9: Correlations matrix of variables

		Dep. Willingness	V1= Trust	V2=privacy and security	V3=ease	V4=usefulness
Dep Willingness	Pearson Correlation	1	.178	-.037	-.072	.196
	Sig. (2-tailed)		.157	.767	.566	.117
	N	100	100	100	100	100
V1= Trust	Pearson Correlation	.178	1	-.078	.281*	.322**
	Sig. (2-tailed)	.057		.536	.023	.009
	N	100	100	100	100	100
V2=privacy and security	Pearson Correlation	-.037	-.078	1	.109	.053
	Sig. (2-tailed)	.767	.536		.388	.676
	N	100	100	100	100	100
V3=ease	Pearson Correlation	-.072	.281*	.109	1	.143
	Sig. (2-tailed)	.566	.023	.388		.255
	N	100	100	100	100	100
V4=usefulness	Pearson Correlation	.196	.322**	.053	.143	1
	Sig. (2-tailed)	.117	.009	.676	.255	
	N	100	100	190	100	100

*Correlation is significant at the 0.05 level (2-tailed). **Correlation is significant at the 0.01 level (2-tailed)

Source: author's own work.

Table 9 presents the correlation matrix of variables. Firstly, we will discuss the correlation between the dependent variable (willingness of Lebanese customers to use online banking) and all the independent variables. The correlation between the dependent variable (willingness) and the independent variable (trust) is equal to 0.178 so it's positive and statistically significant at 10% (0.057). The correlation between the dependent variable (willingness) and the independent variable (privacy and security) is equal to -0.037 so it's negative and also statistically insignificant (0.767). The correlation between the dependent variable (willingness) and the independent variable (perceived ease of use) is equal to -0.072 so it's negative and statistically insignificant (0.566). Finally, the correlation between the dependent variable (willingness) and the independent variable (perceived usefulness) is equal to 0.196, so it's positive but also statistically insignificant (0.117). On the other hand, we will discuss the correlation between the independent variables themselves. The correlation between trust and privacy and security is equal to -0.078 so it's negative and statistically

insignificant (0.536). This means that as trust increases, customers will be less private and secured to use internet banking. In addition, the correlation between trust and perceived ease of use is equal to 0.281 so it's positive and statistically significant at 5% (0.023), also the correlation between trust and perceived usefulness is equal to 0.322 so it's positive and statistically significant at 1% (0.009). Moreover, the correlation between privacy and security and perceived ease is equal to 0.109 so it's positive but statistically insignificant (0.388), whereas the correlation between privacy and security and perceived usefulness is equal to 0.053 but also statistically insignificant. And finally, the correlation between perceived ease of use and perceived usefulness is equal to 0.143 so it's positive but also statistically insignificant (0.255).

Regression Estimations

In this section we are going to study the impact of each of perceived ease of use, perceived usefulness, trust, and privacy and security on the willingness of Lebanese customers to adopt e-banking services. We will present four multiple regression models where each has different combination of variables.

Hypothesis 1 Null hypothesis H0: perceived ease of use has a positive impact on the willingness of Lebanese customers to adopt e-banking services.

Hypothesis 2 Null hypothesis H0: perceived usefulness has a positive impact on the willingness of Lebanese customers to adopt e-banking services.

Hypothesis 3 Null hypothesis H0: trust has a positive impact on the willingness of Lebanese customers to adopt e-banking services.

Hypothesis 4 Null hypothesis H0: privacy and security has a positive impact on the willingness of Lebanese customers to adopt e-banking services.

Table 10: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.269 ^a	.072	.010	.2672
2	.268 ^b	.072	.026	.2651
3	.231 ^c	.053	.023	.2655
4	.196 ^d	.039	.023	.2655

Source: Authors own work

Table 10 presents four models. Model 1 explains 1% of the variability of the dependent variable (willingness of Lebanese customers to use online banking services), while model 2 explains 2.6% of the variability of the dependent variable. As to model 3 and 4, they both explain 2.3% of the variability of the dependent variable.

Table 11: Coefficients' and independent variable

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	.431	.133		3.252	.002
	V1= Trust	.102	.086	.163	1.188	.040
	V2=privacy and security	.003	.019	-.018	-.145	.085
	V3=ease	-.054	.051	-.140	-1.067	.290
	V4=usefulness	.060	.048	.165	1.252	.215
2	(Constant)	.428	.130		3.304	.002
	V1= Trust	.103	.084	.165	1.227	.025
	V3=ease	-.055	.050	-.142	-1.105	.273
	V4=usefulness	.060	.048	.164	1.255	.214

3	(Constant)	.309	.072		4.277	.000
	V1= Trust	.080	.082	.128	.980	.031
	V4=usefulness	.057	.048	.155	1.190	.238
4	(Constant)	.317	.072		4.418	.000
	V4=usefulness	.072	.045	.196	1.590	.117

Dependent variable: Dependent willingness

Source: done by author

Table 11 presents the regression estimates for willingness of Lebanese customers to adopt e-banking services. We present several models to test the impact of the independent variables in different combinations on the dependent variable. V1 (trust) shows to have a positive and significant impact on willingness in all models at 5%. This suggests that trust is an important variable in affecting the willingness of customers to use internet banking. V2 (privacy and security) shows to have a positive and significant impact on willingness in model one at 10%. This suggests that privacy and security is an important variable in affecting the willingness of customers to use internet banking. The independent variables perceived ease of use and perceived usefulness show to have no significant impact on the willingness which suggests that they are not important variables in affecting the willingness of customers to use internet banking.

The regression equation is as follows:

$$y = a + bx_1 + cx_2 + dx_3 + ex_4 + e$$

Model 1: $y = 0.431 + 0.102V1 + 0.003V2 - 0.0554V3 + 0.060V4 + e$

Model 2: $y = 0.428 + 0.103V1 - 0.055V3 + 0.060V4 + e$

Model 3: $y = 0.309 + 0.080V1 + 0.057V4 + e$

Model 4: $y = 0.317 + 0.072V4 + e$

IV. CONCLUSION

As a conclusion the online banking is being expanded in Lebanon, males tend to use online banking more than females this can be easily explained in an emerging market such as Lebanon since males are more useful to fund transfers, online trading requests, Internet accounts and other electronic business, this shows that Females should be more encouraged to using online banking.

Moreover the most people using online banking is under the age of 40 since they are more familiar via technological services than older people and this shows the importance to train older people for using such technology.

The statistics also showed that many people are still not encouraged to purchase products online while few of them are encouraged to purchase and pay online, this shows that the trust in such technology is still weak and that's what banks should focus on to support such technology.

Knowing that from the overall bank customers about half of them have an internet bank account and most of them choose to have an online banking account since they believe that it could be more easier to maintain banking transactions such as balancing inquiry in the first level then comes paying bills, transferring funds and ordering check books respectively.

APPENDIX

Questionnaire

Directions: Tick the box which corresponds to your choice

A- General Information:

1. Name: _____

2. Age:

- 20- 30
- 30-40
- 40-50
- 50-60

3. Gender:

- Male
- Female

4. Educational level:

- PHD
- Master Degree
- Bachelor
- High School
- Undergraduate
- Other

5. Are you employed?

- Yes
- No

If yes, how many years of experience do you have?

- 2 years
- 4 years
- 6 years
- More than 8 years

B- Internet and Banking Information: The following five questions will study the effect of perceived ease of use on the adoption of e-banking by banks' customers.

1. How long have you been using the World Wide Web (WWW)?

- 1 to 2 years
- 2 to 4 years
- 4 to 6 years
- 6 to 8 years
- More than 8 years

2. How many hours per week do you use your computer for work?

- Less than 1 hour
- 1 to 5 hours
- 5 to 10 hours
- 10 to 20 hours
- Over 20 hours

3. Which of the following methods do you use while using online services?

- DSL
- Dial-up
- Cable
- Broadband

4. How frequently do you use e-banking services per month?

- 1 to 3 times
- 3 to 8 times
- 8 to 12 times
- Over 12 times

5. How frequently do you use an Automated Teller Machine (ATM) per month?

- Less than 1time
- 1 to 3 times
- 3 to 8 times
- 8 to 12 times
- Over 12 times

The following three questions will study the effect of privacy and security on the adoption of e-banking by bank's customers.

1. Do you have an Internet bank account?

- Yes
- No

2. Do you use any of the following when you use e-banking? (choose the most frequent used ones)

- Security device
- SMS text password (SMS from your bank providing u with the password)
- E- certificate
- I never use these

3. If you don't have an internet bank account, what are the main reasons that you have not opened one yet? (check all that apply)

- Never heard of Internet banking
- Concerned about security and privacy
- Don't see any real value in having this type of account
- Not available through my bank
- The new system is not friendly used
- I am not skillful in the computer
- Others

The following two questions will study the effect of trust on the adoption of e-banking by bank's customers.

1. Have you purchased any product through WWW?

- Yes
- No

2. What is the percentage of your household monthly income you deposit to your internet bank account?

- 10%
- 20%
- 30%
- 40%
- 50%
- Don't know
- Not applicable

The following five questions will study the effect of perceived usefulness on the adoption of e-banking by bank's customers.

1. If you don't have an internet bank account, how likely is it that you will open one within the next 12 months?

- Very Unlikely
- Somewhat unlikely
- Somewhat likely
- Very likely

2. What is the reason for choosing e-banking services?

- Convenience (24 hours service, everywhere connectivity)
- Curiosity
- Low service charge
- Easy to maintain my banking transaction activity
- Others

3. Which online features (services) do you use regularly? Please select all that apply.

- Pay bills
- Balance inquiry

- Transfer funds between accounts
- Process payroll
- Order check books
- Others

4. How frequently do you visit your traditional bank since you started using online banking?

- Less than 1 time
- 1 to 2 times
- 2 to 4 times
- 4 to 6 times
- 6 to 8 times

5. How satisfied are you with online banking services?

- Very satisfied 77
- Satisfied
- Neutral
- Unsatisfied
- Very unsatisfied

Abstract- Tuberculosis is a crucial global public health problem which ranks second to HIV/AIDS as cause of mortality and is the leading cause of morbidity and mortality among people living with HIV/AIDS. Kenya is burdened with an estimated TB prevalence of 266 per 100,000. 52.5% of cases and 5.2% TB associated mortality occur among children below 5 years. Kisumu County is a TB and HIV endemic zone with a prevalence of 208-306 per 100,000 and 19.3% respectively. Children below 5 years who are household contacts with sputum positive pulmonary tuberculosis persons should be initiated on Isoniazid Preventive Therapy (IPT). This practice remains low hampering the 'END TB' strategies in Kisumu County. This descriptive Cross-Sectional study determined prevalence and factors associated with IPT initiation among children below 5 years living in Kisumu County. Significance was set at $p < 0.05$ and analysis done using STATA. Prevalence was established as [70.2%; 95% C.I (63.0-76.6)] with highest uptake among females [72.6%; 95% C.I (67.7-80.7)] against [67.5%; 95 % C.I (56.3-76.9)] in males. Caregivers with Higher level of education [aPR=1.36; 95% C.I (1.04-1.78)] were more likely to initiate children on IPT compared to those with incomplete primary education. Respondents of younger age [aPR=1.48; 95% C.I (1.27-1.73)] were more likely to initiate children on IPT compared to those > 40 years. The study concluded that IPT uptake is still unexpectedly low and this may be a major driver of TB infection in young children. The study recommends that the Ministry of health should advocate for health promotion activities unlimited to sensitization. Further studies need to examine the correlates of adherence and predictors of missed opportunity to IPT initiation.

Index Terms- Prevalence, Isoniazid, Tuberculosis, cross-sectional, household.

I. INTRODUCTION

Tuberculosis (TB) is a universal public health problem, coming after HIV/AIDS as the greatest cause of mortality. *Mycobacterium tuberculosis* infection is also a leading cause of

morbidity and mortality among people living with HIV (PLHIV) worldwide [1] [2]. Overall, 83% of all TB cases in 2014 reportedly occurred in the 22 high burden countries. Of these countries, 9 are found in Africa: South Africa, Nigeria, Ethiopia and Kenya among others. In the year 2015, there were 10.4 million incident cases of TB globally of which 10% occurred in children. Prophylaxis with INH has been demonstrated to reduce remarkably the incidence of TB in children aged below five years who are household contacts of sputum positive Pulmonary Tuberculosis (PTB) persons and in people living with HIV/AIDS (PLHIV) through prevention of disease progression. Children are highly susceptible to TB infection, which mostly occurs following exposure from an infectious adult [3]. In Kenya, TB is the leading cause of morbidity and mortality among persons infected with HIV. Kenya is one of the 22 high TB burden countries in the world with a national prevalence of 266 (range 189-281) per 100,000 population, and an incidence of 81,518. Forty-five percent (36,817) were new sputum positive cases. Children contributed 8.5% (6,968) with county variations ranging from 4.6% in Murang'a to 17.8% in Turkana; 52.6% of the children being below the age of 5 years, and 47.4% between 5-14 years of age. Recognizing the high prevalence of TB in the country, especially in the wake of HIV epidemic, and in line with WHO policy on TB and HIV collaborative activities, The Kenyan Ministry of Health (MOH) recommends IPT for all children below five years who are in close contact with an infectious smear or culture positive PTB case. In Kenya uptake of IPT in children is still low with a national uptake of 5.5% among children aged below five years with a household contact of sputum positive PTB against an adult uptake of 33% [4]. This necessitates the need for IPT uptake to be met by the country as a whole, especially Kisumu County.

II. METHODOLOGY

Study design: The descriptive cross-sectional study was conducted in Kisumu East Sub County, Kisumu County

Table 1: Inclusion and Exclusion criteria

Inclusion criteria	Exclusion criteria
Sputum positive PTB persons with household contacts aged below five years enrolled for TB care within the selected TB clinics in Kisumu County.	Sputum positive PTB persons with household contacts aged below five years and are on transit to other counties
Ability to provide an informed consent.	Persons who are very sick and are unable to consent and respond the questionnaire
Persons aged 18 years and above.	

Sample size determination: Sample size used was 175, based on Cochran equation for proportion with estimates of IPT uptake in children at 6.0%. Disproportionate sampling technique was used to determine the number of smear positive TB persons with contacts aged below five years and Purposive sampling to select sputum positive PTB persons with at least one child below five years for each stratum.

Data collection: Data was collected from respondents during their clinic revisits. The questionnaires were administered at the end of patient clinical examination and dispensing of medications following successful consenting process.

Data Analysis: Data was keyed in Access, cleaned and validated for analysis. Fisher’s exact test was used to determine the association between categorical variables and initiation on IPT. Generalized linear model was used to model IPT initiation since the prevalence was greater (>10%), thus logistic regression with odds ratios was not appropriate measure of effect. Explanatory variables that were significant at bivariate analysis $P < 0.2$ were further incorporated in the final multivariable regression model using backward elimination and retaining predictors significant at $P < 0.05$. Potential confounding effect

was examined for each covariate by two-way interactions. Data analysis was done using STATA version 14.1.

Ethical considerations: Ethical approval was sought from Institutional Review Board of the University of Eastern Africa, Baraton (REC: UEAB/8/8/2017) and the JOOTRH (ERC.1B/VOL.1/398). A written informed consent was obtained from the participants before collecting data while privacy and confidentiality was ensured on all the information obtained.

III. RESULTS

Socio-Demographic Characteristics of respondents: The mean age of the respondents was 33.2 [SD± 11.2] with 102(27.4%) aged between 25-29 years. Out of 175, 95 (54.3%) were female and 51(29.6%) of the respondents had incomplete secondary education. One hundred and two (58.9%) of the respondents were in a monogamous marriage. Ninety-four (53.7%) of the respondents resided in urban settlement with 89(52.5%) of the respondents being unskilled in their occupation. (Table 2).

The prevalence of IPT initiation: The overall prevalence of IPT initiation among children aged below 5 years was 70.3 % (n=123) with 69(72.6%) IPT initiation among female PTB contacts compared to 54(67.5%) among male PTB contacts (Figure 1).

Figure 1: The Prevalence of IPT initiation

Socio-demographic factors associated with initiation of IPT: Complete primary level of education, incomplete secondary level of education and above secondary (Crude PR=1.52; 95%CI 1.07-2.16; P=0.020); (Crude PR=1.49; 95%CI 1.30-1.71; P<0.001) and (Crude PR=1.56; 95%CI 1.21-2.01; P=0.001) respectively, were more likely to initiate their children on IPT as compared to those with incomplete primary level of education. Respondents whose age group was <25Yrs (Crude PR=1.43; 95%CI 1.02-1.99; P=0.038) were more likely to initiate their children on IPT compared to those of

>=40 Yrs age group. Moreover, respondents who resided in urban and pre-urban areas (Crude PR=1.89; 95%CI; 1.49-2.40; P<0.001) and (Crude PR=1.66; 95%CI 1.35-2.05; P<0.001) respectively, were more likely to initiate their children on IPT compared to those who resided in rural areas. Notably, respondents who were skilled in their occupation (Crude PR=1.26; 95%CI 1.16-1.37; P<0.001) were more likely to initiate their children on IPT as compared to those of unskilled occupation (Table 3).

PR- Prevalence ratio, CI- Confidence Interval

Socio-economic factors associated with initiation of IPT: Respondents whose social economic status were middle and richer (Crude PR=1.61; 95% CI 1.06-2.44; P=0.025) and (Crude PR=1.70; 95% CI 1.18-2.44; P=0.004) were more likely to initiate their children on IPT compared to those from the poorest social economic position. Respondents who had 3-5 and more than five persons in the household (Crude PR=2.35; 95% CI 1.21-4.56; P=0.012); (Crude PR=2.12; 95% CI 1.03-4.38; P=0.042) were more likely to initiate their children on IPT compared to those who had 1-2 number of persons in the household. Notably, respondents who sleep with their children in the same room (Crude PR=1.54; 95% CI 1.04-2.27; P=0.032) were more likely to initiate their children on IPT compared to those who did not sleep with the children in the same room (Table 4.3).

Multivariate analysis of factors associated with initiation of Isoniazid Preventive Therapy: A multivariate prevalence revealed that respondents who had secondary incomplete level of

education (Adjusted PR=1.36; 95% CI 1.04-1.78; P=0.023), were more likely to initiate their children on IPT as compared to those with incomplete primary level of education level. Respondents

aged between 25-29 years (Adjusted PR=1.48; 95% CI 1.27-1.73; P<0.001) were more likely to initiate their children on IPT compared to those of aged 40 years and above. Those who resided in urban and pre-urban (Adjusted PR=1.56; 95%CI 1.16-2.09; P=0.003) and (Adjusted PR=1.60; 95%CI 1.06-2.42; P=0.024) respectively, were more likely to initiate their children on IPT compared to those who reside in rural areas. Respondents who had 3-5 people and more than five persons in the household (Adjusted PR=1.69; 95% CI 1.13-2.51; P=0.010) and (Adjusted

PR=2.19; 95% CI 1.42-3.37; P<0.001) were more likely to initiate their children on IPT compared to those with 1-2 persons in the household.

Moreover, respondents who had 3-6 hours and more than six hours' average time of contact during the day (Adjusted PR=1.63; 95% CI 1.14-2.33; P=0.007) and (Adjusted PR=1.50; 95% CI 1.09-2.06; P=0.012) were more likely to initiate their children on IPT compared to those who had less than three hours average time of contact during the day.

IV. DISCUSSION

The prevalence of IPT initiation: This study established 70.2% prevalence rate of IPT initiation among children aged below 5 years. Females' contacts had the highest initiation rate 72.6% compared to 67.5% among males. A study in Ethiopia of 221 children eligible for IPT, 64.3% (142) received IPT, 80.3% (114) successfully completed six months of therapy. No child developed active TB while on IPT. Contact screening is recommended by the WHO despite the implementation challenges [5]. Children whose caregivers had a history of being on IPT had an increased likelihood of initiation according to a study in Nairobi [6]. It is estimated that around 10% of the world's tuberculosis (TB) cases occur in children 0–14 years of age [7]. WHO guidelines promote active screening and Isoniazid Preventive Therapy (IPT) for such children under 5 years, this established intervention is still not completely embraced in endemic countries [8]. Of the 184 children who were screened in a study of IPT Programme in South Africa, 59% ($n=108$) were documented as having started IPT, 2 started full TB treatment and for 40% ($n=74$) there was no documentation of further management or follow-up. The last represents missed opportunities for providing TB preventive therapy in a community where TB is rife [9].

A number of important initiatives have been facilitated by the childhood TB subgroup of the WHO Stop TB partnership aimed at greater emphasis on childhood TB by National TB programmes (NTP) that includes screening children living with an infectious case followed by the provision of preventive therapy (PT) for those cleared of TB disease [3]. However, these recommendations, including preventive therapy provision, are rarely fully implemented in high-burden countries. This is vital as a large proportion of childhood TB occurs in children younger than 5 years who would have been eligible for PT [10]. Literature review regarding barriers to implementation of PT found that there are a myriad of factors, including difficulties in screening, poor adherence, fear of increasing INH resistance and poor acceptability among primary caregivers and healthcare workers [8].

The benefits of PT have been recognized since the 1950s. Studies indicate that to attain TB eradication by 2050, preventive measures must be included in TB programmes [11]. Following infection, infants and young children (<5 years) are at the highest risk of progression to disease. Review of the pre-chemotherapy literature shows that 40–50% of infected infants (0–11 months), 10–20% of children aged 1 year and 10% of children aged 2–4 years progress to disease [12].

Household level factors associated with initiation of IPT: Studies in developed and developing countries show that the most effective means of case identification is at the household contact level [13, 14]. Studies have shown that risk of TB was associated with the number of people living together in the household also referred to as overcrowding [15–17]. Studies have shown that increased household size was found to be important factor in infection of TB and overcrowding has been documented as a risk factor for TB in a variety of settings [18, 19]. This study

is consistent with the fact that overcrowding is a risk factor for TB and revealed that respondents who had more than five persons in the household were more likely to initiate their children on IPT compared to those who had 1–2 persons in the household. Respondents who sleep with their children in the same room were more likely to initiate their children on IPT compared to those who did not sleep with their children in the same room. Studies have shown that children exposed to patients who are sputum positive and/or have extensive lung involvement are at high risk of infection. Children who sleep in close proximity to a source case and those whose source case is a female family member are also at increased risk, more than five times higher in some reports hence a higher likelihood of initiation to IPT [20–22].

Recommendation: This study recommends that the Ministry of Health and collaborates to advocate for health promotion activities such as sensitization among smear positive PTB persons with children aged below 5 years to help bolster IPT uptake in rural areas.

Acknowledgements: I sincerely thank the Almighty God for enabling me carrying out this research, my supervisors Prof. Gideon Kikuyu and Dr. Walter Otieno for their immense support. Great thanks to Ethical Review Committee of Jaramogi Oginga Odinga Teaching and Referral hospital and University of Eastern Africa, Baraton for permission to carry out data collection. ABSTRACT

Across the globe the search for ways of a more resourceful convention of the abundant, untapped reserves of over 1850.5 ppb of methane gas. The UV photofragment spectrum of the dication complex ion $[\text{Mn}(4\text{-Picoline})_3]^{2+}$ had been recorded in the gas phase for theoretical and experimental analysis using a quadrupole ion trap mass spectrometer. Using a combination of the pick-up technique and high energy electron impact the $[\text{Mn}(4\text{-Picoline})_3]^{2+}$ ions were prepared and then held in a cold ion trap where they were excited with tuneable UV radiation and effectively activated further with methane. From the DFT calculations, the optimised C1 conformer of $[\text{Mn}(4\text{-Picoline})_3]^{2+}$ was confirmed.

Methane activation with manganese 4 methyl dication complex ion resulted in the formation $[\text{Mn}(4\text{-Picoline})_3\text{H}_2\text{O}]^{2+}$, $[\text{Mn}(4\text{-Picoline})_3(\text{H}_2\text{O})_2]^{2+}$, $[\text{Mn}(4\text{-Picoline})_3\text{N}_2]^{2+}$, $[\text{Mn}(4\text{-Pico})_3\text{CO}_2]^{2+}$, $[\text{Mn}(4\text{-Picoline})_3(\text{CH}_3)_2]^{2+}$ and $[\text{Mn} 4\text{-Picoline} (\text{CH}_4)]^+$ were recorded. The calculated charge on the metal centre was reduced by approximately 20% in the optimised geometry $[\text{Mn}(4\text{-Picoline})_3\text{CH}_4]^{2+}$ of as compared to the charge of +2 assumed on Mn metal in the potential energy curve, (PEC) calculation. The DFT calculated result revealed that the binding energy of methane to the metal dication complex ion was that overestimated on the PEC model by 32%.

KEY WORDS: Manganese, Binding energy, 4- Picoline, Methane, DFT, PEC, Gas Phase.

INTRODUCTION

Methanol is the simplest alcohol molecule and is emerging as a clean, sustainable transportation fuel of the future across the world [1]. Methanex is working with partners worldwide to promote methanol as a clean, sustainable road fuel. Currently methanol is blended with gasoline in high-proportion such as M85-M100 in flex-fuel or in low-quantities and used in existing road vehicles or dedicated methanol-fuelled vehicles. In recent times technology is also being commercialized to use methanol as a diesel substitute. [2].

China currently leads the world in methanol fuel blending. In 2017, China consumed as much as 12 million metric tons (4 billion gallons) of methanol to fuel various cars, trucks and buses. China's fuel pool consists of 8% methanol and Chinese drivers have covered more than 200 million miles in methanol fuelled cars [2]. Statistics reveal that in more than a dozen provinces blends such as M15 (15% methanol and 85% gasoline) are sold as 95 and 97 octane fuels for use in existing passenger cars. The central government of China considers methanol as a strategic transportation fuel and in an attempt to develop national standards for methanol-fuelled vehicles, the government has launched a demonstration of light-and heavy-duty vehicles running on M85 (85% methanol and 15% gasoline) and M100 (100% methanol) in Shanxi, Shaanxi provinces and in the city of Shanghai [2].

It is not surprising that across the globe the methanol fuel 'fever' is spreading uncontrollably like a bush fire. In November, 2013, Israeli Prime Minister Benjamin Netanyahu launched a demonstration of M15 vehicles and hosted a fuel choices summit in Tel Aviv to focus attention on the potential for methanol based fuels in Israel. As a way of encouragement and promoting methanol fuel, the federal government of Australia does not tax methanol fuels, and Methanol Institute member company Coogee Energy is demonstrating the use of gasoline, ethanol and methanol (GEM) fuels in passenger cars [2]. President Obama recently called the United States the "Saudi Arabia of natural gas" and asserted that it was time for our oil-dominated transportation fuel market to open the door to natural gas. As he rightly said it would be cheaper for consumers and reduce the strategic importance of oil but first we need cars that can run on methanol, a high-octane fuel made from converted natural gas [2].

With the aim to develop a cost efficient and environmentally friendly vehicle with zero harmful emissions and an exhaust that is as clean as the air surrounding, the Danish methanol fuel cell manufacturer SerEnergy has launched a commercial reformed methanol fuel cell vehicle with a driving range up to 800 km on a tank of methanol [3].

Currently global methane concentrations have reached 1850.5 ppb in July 2018 [4]. This very large reserves of methane, could serve as a feedstock for the production of chemicals and as a source of energy well. Both methane and carbon dioxide are similarly problematic however, methane retains, roughly 30 times more heat than CO₂ in the atmosphere even though CO₂ is five times more than methane [5]. The future global task is to trap methane and convert it into the best efficient use and other valuable and/or environmentally friendly chemical compounds [4].

This research sought to form doubly charged manganese dication complexes [Mn(4-methyl Pyridine)₃]²⁺ ions and activate them with methane follow by the calculation of the binding energy of methane to the metal complexes in the gas phase [6]. Imagine an industry that has methane as feed stock for the production of chemicals and as a source of energy where methane is converted to much more efficient and environmentally friendly methanol. For example, fractional oxidation of methane offers a distinct road of direct converting of methane to liquid methanol as reveal by the equation $\text{CH}_4 + \frac{1}{2}\text{O}_2 \rightarrow \text{CH}_3\text{OH}$ [8].

2.0 Experimental Procedure

The apparatus shown schematically in Fig. 1 detailed the experimental procedure for the formation of [Mn(4-Picoline)₃]²⁺ dication complex ions. The systematic description of the entire instrument was given by the author in his previous publication [9]. In summary the instrument has five differentially pumped vacuum chambers namely supersonic expansion, beam collimation, metal vaporization and pick-up (oven), quadrupole mass selection and ion trapping.

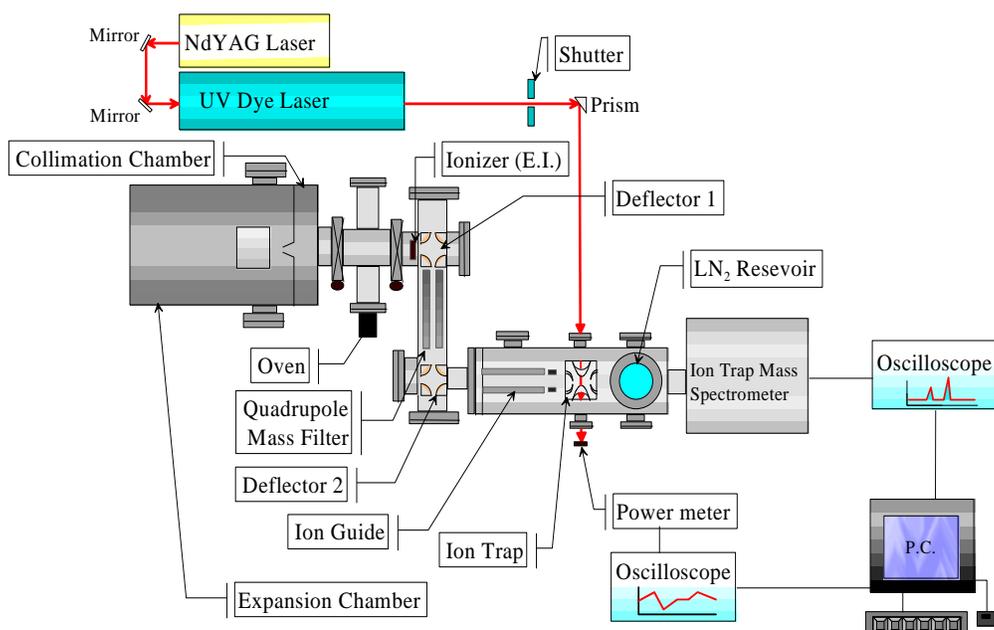

Fig. 1. Schematic diagram of the experimental set up, showing the pick-up region (oven), the quadrupole mass filter, and the ion trap, together with auxiliary equipment.

RESULTS AND DISCUSSION

The appearance of discrete structured sharp mass spectrum of $[\text{Mn}(4\text{-Picoline})_3]^{2+}$ at 167 amu and a minuscule hydrated complex of $[\text{Mn}(4\text{-Picoline})_3\text{H}_2\text{O}]^{2+}$ at 176 amu (Figure 2) similar to what was observed in the ethane activation [9] indicates that the working conditions in the experiment set up remained the same in both methane and ethane activation with $[\text{Mn}(4\text{-Picoline})_3]^{2+}$ metal dication complex ion.

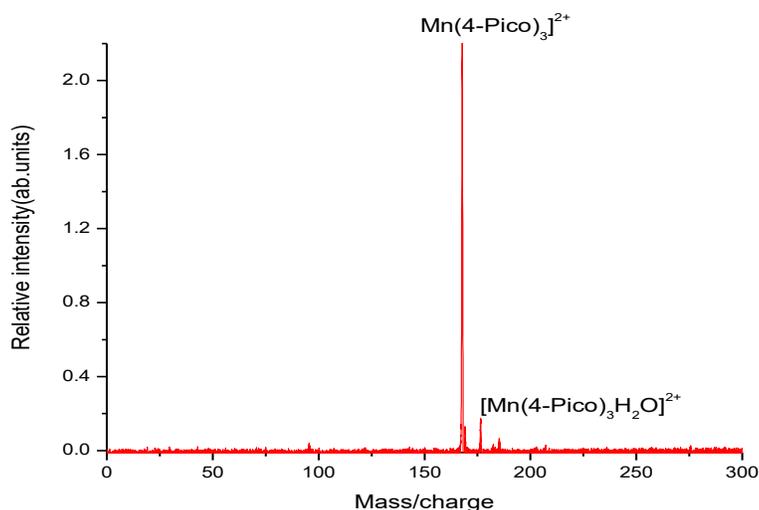

Figure 2: Mass spectrum of $[\text{Mn}(4\text{-Picoline})_3]^{2+}$ [9]

ACTIVATE OF $[\text{Mn}(4\text{-PICOLINE})_3]^{2+}$ WITH METHANE

Figure 3 represents the photofragmentation pattern of the manganese dication complex ion $[\text{Mn}(4\text{-Picoline})_3]^{2+}$ with methane. As revealed distinct ion peaks namely the isolated parent fragment of $[\text{Mn}(4\text{-Picoline})_3]^{2+}$ at 167 amu the hydrated parent dication complex ions of $[\text{Mn}(4\text{-Picoline})_3\text{H}_2\text{O}]^{2+}$ at 176 amu and the dihydrated parent dication complex ions $[\text{Mn}(4\text{-Picoline})_3(\text{H}_2\text{O})_2]^{2+}$ at 185 amu, the metal dication nitro parent complex ion $[\text{Mn}(4\text{-Picoline})_3\text{N}_2]^{2+}$ at 181 amu, the carbonated parent fragment, $[\text{Mn}(4\text{-Pico})_3\text{CO}_2]^{2+}$ at 189 amu were observed. The ability of the $[\text{Mn}(4\text{-Picoline})_3]^{2+}$ to pick methyl under laser power was observed in the formation of $[\text{Mn}(4\text{-Picoline})_3(\text{CH}_3)_2]^{2+}$ at 182 amu. The photofragmentation path with the loss of a picoline ion was observed resulting in the formation of a main daughter fragment peak corresponding to coordinatively unsaturated $[\text{Mn}(4\text{-Picoline})]^{+}$ at 148 amu. The ability of this daughter fragment to pick methane to form manganese 4-picoline monovalent complex ion of $[\text{Mn} 4\text{-Picoline}(\text{CH}_4)]^{+}$ at 164 amu was recorded.

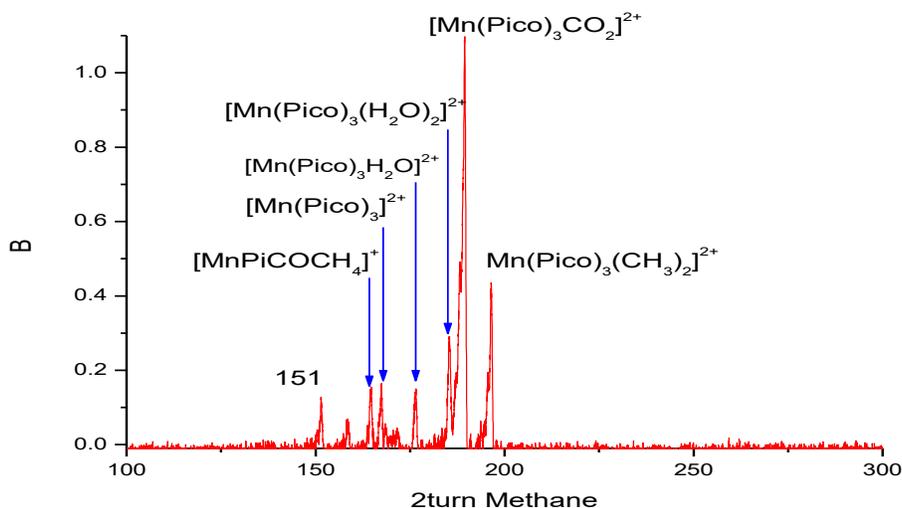

Figure 3: Photofragment mass spectrum of $[\text{Mn}(4\text{-Picoline})_3\text{CH}_4]^{2+}$ (44000cm^{-1})

CALCULATION OF THE STRUCTURE AND BINDING ENERGY OF METHANE WITH MANGANESE 4-PICOLINE COMPLEX DICATION IONS.

The optimised geometry conformer of $[\text{Mn}(4\text{-Picoline})_3\text{CH}_4]^{2+}$ was observed to be C_1 symmetry Figure 4 and the shortest manganese-methane (Mn-C) distance of 2.0 Å.

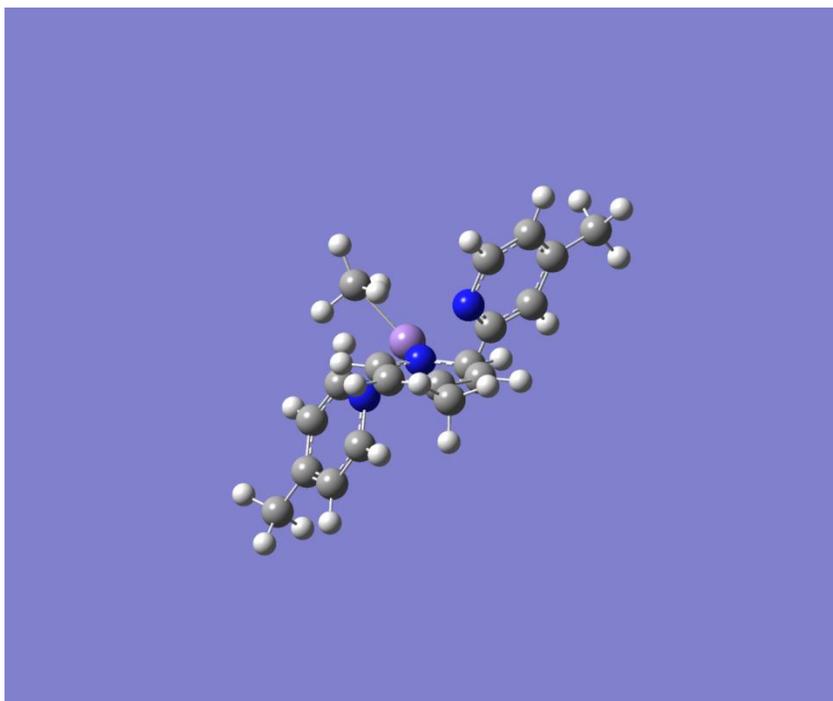

Figure 4: The Optimized geometry of $[\text{Mn}(4\text{-Pico})_3\text{CH}_4]^{2+}$ with C_1 Symmetry

Table 1: Binding Energies of Methane with $\text{Mn}(\text{4-Picoline})_3^{2+}$ Complex Ion Calculated using both BVP86/6311++G(d, p) and TPSSh/6311++G(d, p)

Reaction	BVP86/kJ/mol	TPSSh/kJ/mol
$[\text{Mn}(\text{4-Picoline})_3]^{2+} \rightarrow \text{Mn}^{2+} + 3(\text{4-Picoline})$	1617.31	1617.31
$[\text{Mn}(\text{4-Picoline})_3\text{Me}]^{2+} \rightarrow [\text{Mn}(\text{4-Picoline})_3]^{2+} + \text{Me}$	13.15	13.14
$[\text{Mn}(\text{4-Picoline})_2\text{Me}]^{2+} \rightarrow [\text{Mn}(\text{4-Picoline})_2]^{2+} + \text{Me}$	35.71	35.72
$\text{Mn}(\text{4-Picoline})\text{Me}]^{2+} \rightarrow [\text{Mn}(\text{4-Picoline})]^{2+} + \text{Me}$	120.17	120.10
$[\text{Mn}(\text{4-Picoline})_2]^{2+} \rightarrow \text{Mn}^{2+} + 2(\text{4-Picoline})$	1371.14	1371.14
$[\text{Mn}(\text{4-Picoline})]^{2+} \rightarrow \text{Mn}^{2+} + \text{4-Picoline}$	110.86	110.84

For $\text{Mn}(\text{4-Picoline})_3\text{CH}_4^{2+}$ complex ion the binding energy was maximised at the optimised structure. The one-third the binding energy of $[\text{Mn}(\text{4-Picoline})_3]^{2+} \rightarrow \text{Mn}^{2+} + 4\text{-Picoline}$ calculated at different levels of theory of zero point energy are in realistic agreement: BP86/6-311++G(d, p) and TPSSh/6-311++G(d, p) at the same levels of theory gave and 527.18 kJ/mol. This theoretical calculated binding energy corresponds to 44068.80 cm^{-1} per molecule which perfectly falls within the experimental photon energy range of 35000 to 45000 cm^{-1} over which the photofragmentation spectra were recorded.

THE ONE DIMENSIONAL POTENTIAL ENERGY CURVE OF $[\text{Mn}(\text{4-PICOLINE})_3\text{CH}_4]^{2+}$

In order to picture the observed charge separation reactions qualitatively a one dimensional potential energy curve model of $[\text{Mn}(\text{4-Picoline})_3\text{CH}_4]^{2+}$ was plotted (Figure 5). From the curves, it was observed that the H transfer separation giving $[\text{Mn}(\text{4-Picoline})_3\text{CH}_3]^{2+} + \text{H}$ from $[\text{Mn}(\text{4-Picoline})_3\text{CH}_4]^{2+}$ (green line) was located closer to the stable curve (red line). The photoinduced charge transfer to give $\text{Mn}(\text{4-Picoline})_3^+$ and CH_4^+ of $[\text{Mn}(\text{4-Picoline})_3\text{CH}_4]^{2+}$ was not observed in the photofragmentation because this reaction is endothermic as evidenced by observing that the potential energy curve (blue) lies above the attractive curve. At the optimised geometry of $[\text{Mn}(\text{4-Picoline})_3\text{CH}_4]^{2+}$ (Figure 4) the manganese-methane distance (Mn-C) is 2.0 \AA which corresponds to 0.18 eV (17.36 kJ/mol in photon energy) on the PEC. Comparing with the calculated DFT of 13.15 kJ/mol it is clear that the PEC calculated value was overestimated by 4.21 kJ/mol which is due to fact that the actual charge on the Mn in the optimised geometry was 1.61 while the charge of $\text{Mn}=2$ was assumed in the PEC calculation.

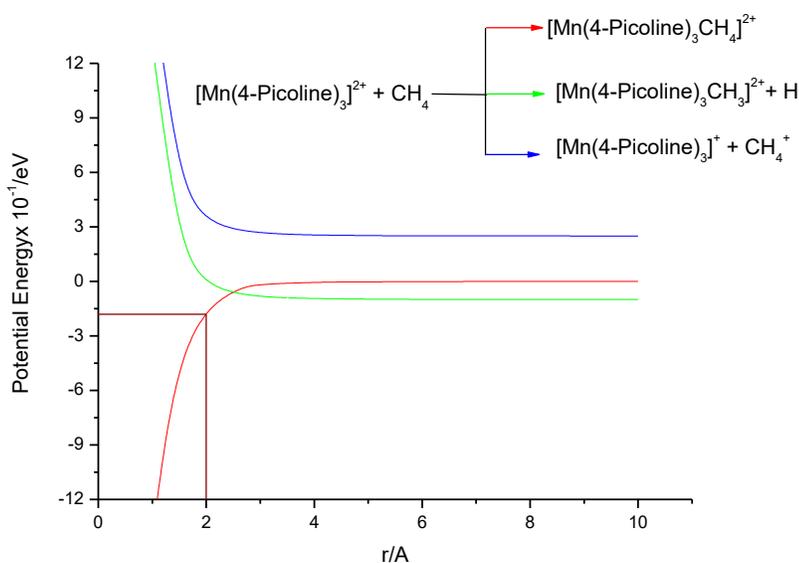

Figure 5: The Potential Energy Surface Curve model showing attractive and repulsive curves of ion-ligand $[\text{Mn}(\text{4-Picoline})_3\text{CH}_4]^{2+}$

CONCLUSION

The average binding energy per molecule of Picoline calculated for $[\text{Mn}(\text{4-Picoline})_3]^{2+}$, lies within the photon energy range over which the photofragmentation spectra were recorded. C_1 symmetry optimised geometry of the methane manganese 4-picoline dication complex ions was observed. The calculated charge on the manganese metal centre was 1.61 on the DFT optimised geometry while the charge assumed for the PEC calculation was +2. The interaction of methane with the $[\text{Mn}(\text{4-Picoline})_3]^{2+}$ resulted in the overestimation of binding energy on the PEC model by 32% as compared to DFT calculation.

Abstract: This research (R & D) uses a Four-D Model approach with the aim of developing OCD (Offensive, Counter Attack, Defensive) learning strategies to improve reading comprehension skills with exposition text material. 60 students were taken who were divided into control classes and experiments with homogeneous abilities. The nonequivalent control group desing test was used to determine the effectiveness of the OCD strategy to influence student learning outcomes by $t_{test} > t_{table} = 6.76 > 0.20017$ and get 90.5% responses of students with very good categories. This shows that the OCD learning strategy can improve reading comprehension skills in exposition text material.

Keywords: *development, strategy, OCD, reading comprehension, exposition text*

INTRODUCTION

Reading comprehension is an inhibiting factor in the world of education, especially classical learning in high school elementary school. This fact is certainly a material consideration and reflection of each teacher in the teaching process. Sometimes students lack respect for reading activities and assume that reading is a simple process that only relies on the sense of sight and utterances. Such understanding is certainly contrary to the nature of reading comprehension. Because, in the process of reading a text, not only the eyes and utensils are functioned, but also the human mind (brain), as well as other tools found in individuals, such as prior knowledge related to text and understanding of vocabulary.

Reading is a complex process (Stern & Shalev, 2013, p. 432), and reading comprehension is a complex cognitive procedure, which ideally produces mental representation and coherence about certain content, namely the contents of one genre of comprehension text (Schmitz, Grasel, & Rothstein, 2017, p. 1117). The comprehension text itself is sometimes assessed directly and explored through questions (pre-read) and viewing or examining images of the text. Text that is used as a discipline tool in schools (Mason, Zaccoletti, Caretti, Scrimin, & Irene, 2018, p. 1) is exposition text. The main communicative purpose of the exposition text is "informing" so that the reader learns something (Kim & Clarania, 2017, p. 911). The exposition text will specifically be explored with knowledge of main ideas, explanatory sentences, difficult words, and discovering new knowledge using their own sentences. Because, according to Daley & Rawson (2018, p. 2) that students cannot memorize every word in detail from a genre of text. Hierarchically, the exposition text according to Herbert, Bohaty, & Lambert (2018, p. 2120) there are five exposition text structures, namely simple, comparable or contrasting descriptions, sequences, causes or consequences, and problems or solutions. Simplified by Montelongo & Herter (2010, p. 89) that exposition text is divided into four types, including problem-solution, comparative-contrast, cause-effect, and generalization.

Based on observations at SD Kemala Bhayangkari 9 that the fundamental problem that causes the objective of learning to read comprehension comprehensively is not yet fully understood is still conventional learning (teacher centered). This has an impact on students who are of moderate and low ability. Students with moderate and low ability have not and are not even actively involved in learning because the strategies implemented cannot yet demand the involvement of each student. The result of domination has a real impact on the learning outcomes of students with moderate and low abilities who have not been able to meet the standards of the Indonesian Language MSC (Minimum Standard of Completeness). For this reason, it needs to be evaluated to find strategic alternatives in minimizing the inability of students in reading comprehension learning.

The real phenomenon mentioned above can be overcome by developing learning strategies that can facilitate students in comprehending comprehensively one reading genre because it is one of the dimensions of the 2013 Curriculum demands, namely student activity in reading comprehension. According to Majid (2013, p. 4), learning strategies include the objectives of the activity, who is involved in the activities, the contents of the activities, the process of activities and the means of supporting activities. Rohman & Amri (2013, p. 29-30) classify strategies into four perspectives, namely direct, indirect, interactive, empirical, and independent learning strategies. The learning strategy implemented in learning to read the understanding of exposition texts in class IV students is called the OCD strategy. This strategy was adopted from the strategy of soccer (Futsal), namely offensive, counter attack, defensive. This OCD strategy is based on "activeness and collectivity" of students. It further emphasizes the role of students (student centered), while the teacher as a facilitator.

In this strategy, students will be divided into three groups with the initials O "offensive, C" counter attack ", and D" defensive ". Group D has a central role in answering all questions or objections proposed from groups O and C. Group O has a single role, namely asking, while group C has a dual role of asking and refutation. The three groups will be rolled following the referenced text changes (exposition text). Each group consists of high, medium and low ability students. The OCD strategy regulation requires each student to argue with a patterned strategy (low-ability students will answer first, after that are moderate-capable students, and high-ability students). So activeness and collectivity in learning are highly demanded and related to the Futsal match strategy system that a match will be successful if the structure of coordination between players is needed to minimize the tendency to centralize certain players or leaders (Travassos, Bourbousson, Esteves, Marcelio, Pacheco, & Davids , 2016, p. 99). The results of adoption of the Futsal strategy adapted into the learning steps, and implementation in learning reading comprehension are expected to be able to improve student learning outcomes in order to achieve MSC (Minimum standard of Completeness).

This study aims to describe the feasibility of OCD learning strategies to improve the reading comprehension skills of fourth grade students, describe the practicality of OCD learning strategies to improve reading comprehension skills of class IV students, and describe the effectiveness of OCD learning strategies to improve reading comprehension skills of fourth grade students.

METHOD

This research is R & D using the Four-D Model adapted from Thiagarajan (1974, p. 37). Based on the Four-D development model, this study was developed until the phase of dissemination or dissemination. A total of 60 students divided into two classes namely experiment and control were taken randomly. The data collection instruments used in this study were note-taking techniques, documentation, observation sheets, questionnaires, and learning outcomes tests in the form of 30 MCQs. The feasibility analysis of the OCD learning strategy is done with a validation sheet that uses a Likert Scale. Practical analysis of OCD learning strategies using teacher and student observation sheets, teacher and student response sheets. Analysis of the effectiveness of the OCD learning strategy can be seen from the student learning outcomes test. Test the learning outcomes through the following stages of processing, (1) test the validity of the expert (lecturer) and be tested on students using the Product Moment correlation formula; (2) the test of learning outcomes is tested for reliability using the Spearman Brown formula; (3) normality test with the formula Chi squared; (4) homogeneity test with variant formula; and (5) t-test using the Nonequivalent Control Group Design.

RESULT OF RESEARCH

The results of the feasibility test of the OCD learning strategy are obtained from the validation sheet. Validated components are learning tools, initial ability test questions (pre-test) and final ability test questions (post-test). Questionnaire for the feasibility of learning strategies is given during individual trials and small group trials. The results of the validation sheet from the validator are as follows:

Table 1.
Results of Validation

Validation Sheet	Percentage	Category
RPP of OCD Learning Strategy	75,16%	Revision
<i>Pre-test</i>	86,98%	Worth using without revision
<i>Post-test</i>	88,78%	Worth using without revision
Teacher and Student Activity Sheet	88,75%	Worth using without revision
Teacher and Student Respon Sheet	91,75%	Worth using without revision

Source: secondary data proceed, 2019

From the results of the validation sheet, it was stated that the OCD learning strategy, learning tools, initial ability test questions (pre-test) and final ability test questions (post-test) were suitable for use in learning. Related to the results sheet of the feasibility response instrument for the learning strategy can be seen in table 2 below:

Tabel 2.
Result of Feasibility Questionnaire Strategy

Trials	Total Of Students	Scores Obtained	%	Interpretations
Trial Limited	10	88	79,77	Very good with revisions

Scale Trial Size	30	478	95,16	Very good
------------------	----	-----	-------	-----------

Source: secondary data proceed, 2019

The results of the student response questionnaire stated that the appropriate OCD learning strategies matched the percentage of limited trials and large-scale trials.

The practicality of the OCD learning strategy can be seen from the results of the observation sheets of teacher and student activities, teacher and student response sheets filled in by two fourth grade teachers in elementary school. The results of the percentage of learning implementation in table 3 below.

Tabel 3.
Teacher Activity Observation

Observer		Total	Percentage	Information
O1	O1			
30	30	60	93,75	Very good

Source: Secondary data proceed, 2019

Based on the data above, it can be concluded that the results of observation of teacher activities using the OCD learning strategy are very good. Furthermore, student activities during learning can be seen in table 4 below.

Tabel 4.
Student Activity Observation

Observer		Total	Percentage	Information
O1	O1			
30	30	60	93,75	Very good

Source: secondary data proceed, 2019

In accordance with the table above, it can be concluded that student activities during the implementation of learning using the OCD learning strategy are categorized very well. For the results of practicality questionnaire learning strategies can be seen in table 5 below.

Tabel 5.
Results of Practicality Questionnaire OCD Learning Strategy

Respondents		Total	Information
1	2		
26	27		
Percentage		94,6%	

Source: secondary data proceed, 2019

Table 5 shows that OCD learning strategies are very good or practical to use in learning activities.

The effectiveness of OCD learning strategies is known through test results (student learning outcomes). Before being used for research, the learning outcomes test questions are first validated to the expert (lecturer). After that, it was tested on 10 students and calculated using the product moment correlation formula, with the question criteria said to be valid if $r_{count} > r_{table}$, which is 0.514. The results of the validation test can be seen in the following table.

Tabel 6.

Source: secondary data proceed, 2019

Of the 35 questions, there are 5 questions that are not valid so that 30 questions are taken to be used as learning outcomes test instruments. After testing the validity, reliability testing is done using the Spearman Brown formula. The calculation results obtained by the reliability of questions is 0.876. Referring to the interpretation of reliability according to Guilford, the test can be concluded to have very high reliability.

The question of validity and reliability will be used for the pre-test and post-test questions in the experimental class during the field trials. The results of the pre-test and post-test will be tested by t-test to determine the effectiveness of the OCD learning strategy. However, before being tested with a t-test, the results of the pre-test and post-test first pass the normality test using the chi-square formula. The results of the pre-test and post-test normality test can be seen in table 7 below.

Tabel 7.
Normality Test

Normality Test	X count	X table	Information
Eksperimental Post-test	0,23333	0.242	Distributed data normal
Control Post-test	0.2	0.242	Distributed data normal
Eksperimental Post-test	0.13333	0.242	Distributed data normal
Control Post-test	0.13333	0.242	Distributed data normal

Source: secondary data proceed, 2019

The next step after the normality test is to conduct a homogeneity test to find out whether the two classes are homogeneous or not. The homogeneity test is carried out using the variance formula. The sample is said to be homogeneous if the value of $F_h < F_t$, with F_t of 1.861. The following are the homogeneity test results of the pre-test and post-test.

Tabel 8.
Homogeneity Test

Homogeneity Test	F count	F table	Information
Pre-test	1,091770	1,861	Homogenous
Post-test	1,360311	1,861	Homogenous

Sumber: data sekunder diolah, 2019

After it is known and proven that the distribution of the data of the two classes is normal and homogeneous, then a t-test with the criteria used is carried out H_0 is accepted if $t_{count} < t_{table}$. The t-test is carried out using the following formula (Arikunto, 2010, p. 349):

$$t = \frac{\bar{X}_1 - \bar{X}_2}{\sqrt{\frac{S_1^2 + S_2^2}{n_1 + n_2}}}$$

Based on the results of the calculation above, it was found that student learning outcomes after learning were 6.76. This can be interpreted that $6.76 \geq 0.20017$, it can be concluded that H_0 is rejected and H_a is accepted. Thus there can be a significant difference between the learning outcomes of the experimental class students and the control class.

DISCUSSION

Feasibility of learning strategies based on the results of validation to learning device experts and elementary school teachers. The development of OCD learning strategies to improve comprehension reading skills is categorized very well. After going through the validation stage and being declared fit for use, the OCD learning strategy can be continued in the next stage, namely limited trials and wide-scale trials. In addition to validating the OCD learning strategy, validation of the learning device was also carried out, initial ability test questions (pre-test), and final ability test (post-test). The overall results of the validation indicate that the learning device, the initial ability test questions (pre-test), and the final ability test (post-test) questions are

appropriate to use. Based on the results of the feasibility analysis, the appropriate OCD learning strategy is used to increase the reading comprehension skills of fourth grade students.

The practicality of the OCD learning strategy can be seen from the results of the teacher activity observation sheet with a score of 93.75%, the observation sheet of student activity with a score of 93.75% very good category, and the practicality questionnaire of the OCD learning strategy filled by two grade IV teachers. 94.6% with a very good category.

The effectiveness of the learning strategy is based on the pre-test and post-test questions for the experimental and control classes in the field test, namely class IV SD Kemala Bhayangkari 9. Class IV B as the control class, while class IV A as the experimental class. Field trials were carried out using nonequivalent control group design techniques. To find out the effectiveness of the OCD learning strategy was calculated using the t-test. Based on the t-test that has been done, the results are 6.76. With t table for df 58 is 0.20017. From these results it can be interpreted that $6.76 \geq 0.20017$, then H_0 rejected and H_a accepted. Thus it can be concluded that there are significant differences between the learning outcomes of the experimental class students and the control class. So, learning uses effective OCD learning strategies to improve student learning outcomes. This is evidenced by the significant difference in learning outcomes between the experimental class and the control class.

CONCLUSION

Based on the results of the research and discussion the results of the study can be summarized as follows: (1) feasible OCD learning strategies are used to improve reading skills in understanding the exposition text of class IV students by referring to the results of the validation and strategy feasibility questionnaire stating that the OCD learning strategy is feasible. (2) The OCD learning strategy is used to improve reading skills in understanding the exposition text of fourth grade students. It can be seen from the calculation of the percentage of observation of teacher activities, student activities, and practicality questionnaires of learning strategies that are in a very good category. (3) Effective OCD learning strategy is used to improve reading skills in understanding the exposition text of class IV students based on the results of the t-test, where the value of t count > t table, which is $2.565 > 2.093$, or in other words H_0 is rejected and H_a is accepted. So it can be concluded that learning uses an effective OCD learning strategy to improve student learning outcomes because there are significant differences in learning outcomes between the experimental class and the control class.

Abstract- Introduction: Nail psoriasis is one of the clinical manifestations of psoriasis that found in the nail, usually affecting the nail plate, nail bed, hyponychium, and nail matrix. Histopathology examination is the gold standard for diagnosis of nail psoriasis. Recently, dermoscopy is reported to have good diagnostic value in dermatology, because it can assess the nail bed and nail plate. Dermoscopy can be done quickly and it is inexpensive.

Objective: To find out the diagnostic value of dermoscopy in nail psoriasis patients.

Subjects and Methods: This study is an analytical study with a diagnostic test design, which include 17 samples of nail lesions of patients with and without psoriasis lesions on the skin. Samples were chosen by non probability sampling with consecutive sampling technique. Dermoscopy and punch biopsy were performed on subjects's nail matrix. The collected data is tabulated and presented in a frequency distribution table. To assess the diagnostic capabilities of dermoscopy, calculations were performed using 2 x 2 tables, where sensitivity values, specificity, positive predictive value (PPV), negative predictive value (NPV), positive likelihood ratio (PLR), negative likelihood ratio (NLR) and accuracy were compared with gold standard, which histopathology examination.

Results: From 17 subjects, there were 76,47% nail psoriasis cases that were diagnosed using dermoscopy and 70,58% cases through histopathology examination. Dermoscopy have sensitivity of 75%, specificity of 40%, PPV of 75%, NPV of 40%, PLR of 0.8, NLR of 0.62, and accuracy of 64.70%.

Conclusions: Dermoscopy cannot be used as a diagnostic tool in nail psoriasis.

Index Terms- dermoscopy, histopathology, nail psoriasis

I. INTRODUCTION

Nail psoriasis is one of the clinical manifestations of psoriasis in the nail, usually affecting the nail plate, nail bed, hyponychium, and nail matrix.¹ The clinical manifestations of nail psoriasis are pitting, nail discoloration (salmon patch, oil drop), onycholysis, subungual hyperkeratosis and splinter hemorrhage.^{2,3} Nail psoriasis can cause discomfort in many patients and can cause significant functional disorders, pain, and psychological stress. This can affect patients in their activities and social life.^{3,4}

The current study estimates that around 7.5 million people in the United States or around 2.2% of the population suffer from nail psoriasis. Psoriasis can occur at any age, but is rarely found at less than 10 years of age, is more common at the age of 15-30

years.⁵ The number of clinical trials with a specific focus in nail psoriasis is currently still low.¹ Until now there is no prevalence data focused on nail psoriasis in Indonesia.

Pitting is a shallow curve or hole in the nail plate that varies in its morphology and distribution. Pitting shows damage to the uppermost layer of the nail plate, which arises from the proximal matrix. Psoriasis lesions in the nail matrix mainly consist of groups of parakeratosis cells in the stratum corneum, which interfere normal keratinization process. When the nail plate grows outward, the parakeratosis cells are exposed to the surrounding environment and the cells decay gradually, leaving different curves on the nail plate. As a result of the accumulation of parakeratosis cells in the nail plate causing the area to become brittle, less attached to each other then peeling off. Generally the diameter of the groove is less than 1 mm.⁶⁻⁸

Nail color change that specific for nail psoriasis is "oil drop" or "salmon patch". It is characterized by a reddish yellow color on the nail bed that looks like a drop of oil under the nail plate. This unique picture of lesions in the nail pads is caused by parakeratosis and tightly arranged acanthosis under the nail plate that looks like a yellowish color.^{2,9} Onycholysis is an expansion of psoriasis in the hyponychium with manifestations of yellow scaly debris that lifts the nail plate. Psoriasis on the nail pads causes the separation of the nail plate from the nail pad. Nails are released in an irregular manner. The nail plate turns yellow, looks like a fungal infection. Apart from the nail plate starting from the distal groove or from the bottom of the nail plate, this onycholysis can affect several nails. Onycholysis can increase the risk of infection, because it allows pathogen to enter nail tissue.^{10,11}

Subungual hyperkeratosis is derived from deposition and collection of cells under the nail plate that have not undergone desquamation. The height of the nail plate raised from the nail bed depends on the level of psoriasis activity in certain structures, such as hyponychium. Hyponychium undergoes some minor vasodilation and a weak inflammatory reaction that consists of lymphocyte cells. A strong inflammatory reaction will excrete protein exudate in the dermis or glycoprotein serum. Although arising from the dermal layer, glycoproteins migrate through the epidermis and accumulate intracellularly in the stratum corneum. Serum deposition is most likely responsible for the appearance of yellow lesions under the nail plate.^{7,9}

Splinter hemorrhage can be seen as small line with length of 3 mm in distal of nail plate.^{7,9} This condition often caused by trauma.¹¹ There are other nail lesion that can be seen. Lesion on nail matrix on short period of time usually caused by intermittent inflammation on nail fold, causing horizontal line and elevation on nail plate, generally known as Beau's line. On the other hand,

lesion on nail matrix in long period of time can cause onychorrhexis.

The gold standard examination to diagnose nail psoriasis is through histopathological examination. Other additional examination that can be used is dermoscopy.⁹ Dermoscopy is a non-invasive procedure using a magnifying tools called a dermatoscope.¹² The use of dermoscopy in nail psoriasis is to detect abnormalities in nail bed and nail plates. This examination is also thought to substitute for histopathological examination in diagnosis of nail psoriasis. Dermoscopy can be quickly done and it is inexpensive. Also, it can help to diagnose nail psoriasis in clinically atypical cases.^{6,9} Dermoscopy has recently been known as an effective tool in diagnosing nail diseases.⁴² This can be seen from several studies using dermoscopy in viewing images and enforcing nail psoriasis using dermoscopy.^{13,14}

II. METHODS

This study is an analytical study with a diagnostic test design with 17 samples of nail lesions with psoriasis lesions on the skin and without psoriasis lesions on the skin. Samples were chosen by non probability sampling with consecutive sampling technique. Dermoscopy and punch biopsy were performed on the nail matrix of the sample. The collected data is tabulated and presented in the form of a frequency distribution table. To assess the diagnostic capabilities of drmoscopy, calculations were performed using 2 x 2 tables, where sensitivy values, specificity, positive predictive value (PPV), negative predictive value (NPV), positive likelihood ratio (PLR), negative likelihood ratio (NLR) and accuracy compared with gold standard, which is histopathological examination.

III. RESULTS

In this study, an examination of patients with nail disorders was performed in patients with nail lesions, in psoriasis and non-psoriasis patients with total of 17 subjects. All research subjects undergone history taking, physical examination, dermatology, dermoscopy and histopathology. The collected datas were then tabulated and analyzed statistically.

The most common clinical features of nails in 17 subjects was onycholysis (46.6%), while the least was splinter hemorrhage (20%) (table 1). From dermoscopic examination, the most frequent findings was pitting (58.8%), while the least was subungual. hyperkeratosis (33.3%) (table 2)

TABLE 1. THE FREQUENCY DISTRIBUTION OF THE STUDY SUBJECTS (N = 17) NAIL LESIONS WITH PSORIASIS LESIONS ON THE SKIN AND WITHOUT

PSORIASIS LESIONS ON THE SKIN BASED ON CLINICAL MANIFESTATION.		
Clinical manifestation	n	Percentage
Onycholysis	7	46,6 %
Pitting	6	40 %
Beau`s lines	5	33,3%
Subungual hyperkeratosis	5	33,3%
Salmon patch	4	26,6%
Splinter hemorrhage	3	20%

TABLE 2. FREQUENCY DISTRIBUTION OF RESEARCH SUBJECTS WITH NAIL LESIONS BASED ON DERMOSCOPY RESULT

Clinical manifestation	n	Percentage
Pitting	10	58,8 %
Onycholysis	7	46,6 %
Beau`s line	7	46,6 %
Splinter hemorrhage	7	46,6 %
Salmon patch	5	33,3%
Subungual hyperkeratosis	5	33,3%

According to several literatures, there are patterns that can be found in accordance with the clinical manifestations of nail psoriasis. Dermoscopy can be useful in evaluating the shape of lesions in nail psoriasis patients in cases without typical nail lesions and its findings can be varied depending on the nail unit involved. Dermoscopy can be useful to differentiate onycholysis caused by onychomycosis, nail psoriasis and trauma onycholysis^{15,16} (Table 3). Onycholysis in onychomycosis can appear as multiple longitudinal striae of the same or different colors (can be yellow, white, brown, etc.) in nail plate. This is caused by reflection, invasion of the fungal colonies and subungual debris.¹⁷ Onycholysis caused by trauma can be seen in the proximal part there is no limit either in the form of lines or erythematous areas. In nail psoriasis, on the proximal edge appears an area with erythematous lines surrounding the onycholysis.¹⁵

TABLE 3. FREQUENCY DISTRIBUTION OF CLINICAL MANIFESTATION AND DERMOSCOPY IN NAIL LESIONS WITH PSORIASIS ON THE SKIN AND WITHOUT PSORIASIS ON THE SKIN.

Dermoscopy	n	percentage
Nail psoriasis	13	76,47%
Onychomycosis	3	17,64%
Trauma onycholysis	1	5,88%

TABEL 4. FREQUENCY DISTRIBUTION OF HISTOPATHOLOGICAL EXEMINATION.										
No	Hype r-keratosis and parakeratosis	Dilation of blood vessels	Munro abscess (polymorphonuclear exocytosis)	Hype r-granulosis	Ach an-tosis	Infiltrates of inflammatory cells	Spo ng-iosis	Sero us exudate	Perivas cu-lar lymphocyte/ne utro-phil infiltrates	Confir m diagnostic psoriasis
P1	+	-	-	+	+	+	-	-	+	Yes
P2	-	-	-	-	-	+	-	-	+	-
P3	+	-	-	-	+	+	-	-	+	Yes
P4	+	-	-	-	+	+	+	-	+	Yes
P5	+	-	-	-	-	-	-	-	-	-
P6	+	-	-	+	-	-	-	-	-	-
P7	+	-	-	-	+	+	+	-	+	Yes
P8	+	-	-	+	+	-	-	-	-	-
P9	+	-	+	+	+	-	+	-	+	Yes
P10	+	-	-	+	+	+	-	-	+	Yes
P11	+	-	-	+	+	+	+	-	+	Yes
P12	+	-	-	+	+	+	-	-	+	Yes
P13	+	-	-	+	+	+	-	-	+	Yes
P14	+	-	-	-	+	+	+	-	+	Yes
P15	+	-	-	+	+	+	-	-	+	Yes
P16	-	-	-	+	+	-	-	-	-	-
P17	+	-	-	+	+	-	-	-	+	Yes
n	15	0	1	11	14	11	5	0	13	12
%	88,23 %	0%	5,88%	64,70 %	82,3 5%	64,70%	29,4 1%	0%	76,47%	70,58%

In this study, the most common histopathological features were hyperkeratosis with parakeratosis of 88.23% and the least was munro abscess 5.88%.

Dermoscopy examination to detect nail psoriasis compared with histopathological examination as the gold standard has a diagnostic test sensitivity of 75%, which means the ability of the dermoscopy device to determine that a positive lesion of nail psoriasis is 75%. Specificity value was 40%, positive predictive value was 75%, negative predictive value was 40%, positive likelihood ratio was 0.8, negative likelihood ratio 0.62 and the accuracy of dermoscopy for nail psoriasis was 64.70%.

IV. CONCLUSIONS

Through this study, we found that sensitivity, specificity, PPV, NPV, PLR, NLR and accuracy values of dermoscopy were low. Therefore, we concluded that dermoscopy could not be used as a diagnostic tool to replace histopathological examination. We suggest to perform similar study in multicenter setting.

Dermatoglyphics –A Curtain To Periodontal Cachet

Dr Seba Abrham*, Dr Kavya P.R **, Dr Arunima P R **

Department of Periodontics, PMS College Of Dental Sciences

DOI: 10.29322/IJSRP.9.08.2019.p9207

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9207>

Abstract- Periodontal disease compromises a wide range of inflammatory condition that affect supporting structure of teeth. To minimize the progression of periodontal disease early detection is crucial. Traditional periodontal parameters have its own limitation. Hence newer diagnostic methods are under research to overcome the difficulty with conventional methods. Dermatoglyphics stands out to be an unexplored field in diagnosing various diseases including periodontal diseases. This review highlights the role of palmar dermatoglyphics as an early predictor for periodontal disease.

Index Terms- Dermatoglyphics, Periodontitis, Whorls, Loops And Fingerprints

I. INTRODUCTION

Periodontitis is an inflammatory disease affecting the supporting structure of tooth as a result of host microbial interaction. It is multifactorial in origin. Early detection of this disease is pivotal since it allows to minimize the dynamics of progression of disease¹. Traditional periodontal diagnostic parameters used clinically include probing depths, bleeding on probing, clinical attachment levels, plaque index, and radiographs assessing alveolar bone level. However, along with these conventional techniques, newer diagnostic methods are under research to overcome the difficulty of sample collection, patient psychology, fear of dental instrument and ease of predicting disease progression. In Periodontology, Dermatoglyphics stands out to be an unexplored field with vast potential in estimating disease progression and treatment prognosis.

Dermatoglyphics are the patterns or the skin ridges on the pads of fingers which represent a person's finger prints. Sir Francis Galton in 1892, published his works on fingerprints². He put forth a rule called 'evidence of no change', which states that an individual's ridge patterns remain consistent throughout his/her lifetime. This hypothesis was later coined as 'Dermatoglyphics' by Dr Harold Cummins and Charles Midlo who detailed the concept as the study of definite ridge patterns on the fingers, palms and soles³. The term comes from two Greek words (Derma = skin; Glyphe = carve)³. It refers to the formation of epidermal skin ridges on volar pads. The formation of these ridge patterns occurs in the 6-7th week of the embryonic period and terminates around the 20th week of gestation.⁴ It is believed due to external pressure of amniotic fluid on body and internal blood pressure on extremities. During early embryogenesis, the directions of the epidermal ridges which develop on the volar surfaces of soles, palms and ridges are determined. Above the proximal end on the distal metacarpal bone volar pads appear like a mound shaped

elevations on each finger. The size and position of these pads are responsible for the shape and formation of the ridge patterns⁵. Seven genes are at least thought to be involved in finger ridge formation⁵. The patterns of nervous system, the genes encoding for the layers of skin, the amount of buckling instability and other factors determine an individual's specific unique set of fingerprints.

In dentistry, evaluation of dermatoglyphics has been associated with several disorders like, hereditary gingival fibromatosis, cleft lip/ palate, bruxism, dental caries etc. Genetics has been linked with periodontitis since ancient times. However, the method used to establish the genetic basis of periodontitis are unavailable at most times and are expensive as well.

Dermatoglyphics have a strong inheritable genetic connection and can be used as diagnostic tool for oral disease and other disease whose aetiology may be influenced directly or indirectly by genetic inheritance⁷. Numerous studies has pointed out the genetic etiology of periodontal disease -Kornman *et al.* studied genetically determined polymorphism in interleukin-1 (α and β), tumor necrosis factor- α , CD14 promoter region and shown them to be risk factors for chronic periodontitis⁸; Another study by Atasu *et al* also concluded strong correlation between dermatoglyphics and Aggressive periodontitis⁹.

Every man is unique so does his fingerprints. Dermatoglyphics has come to be recognized as a potent tool in identification of patients with definite group of periodontal disease. The earliest detection of disease is the key for a successful treatment plan. With the advent of newer techniques of diagnosis, this can throw light into the future of treatment modalities

II. PRINCIPLE OF DERMATOGLYPICS

Fingerprint has three important principles⁹:

A): It is an individual characteristic

B): It will remain unchanged during individual's lifetime

C): It have general ridge patterns which help to classify systematically

III. CLASSIFICATION OF FINGERPRINTS

In 1892, as stated by Sir Francis Galton, fingerprints are classified as Arches, Loops, and Whorls. The classic and widely used syllabary is A= arches; Lr = radial loops; Lu= ulnar loops; and W= whorls⁹ (Figure 1)

Arches(A): It is the simplest pattern found on fingertips and least frequent pattern, which pass across the finger with slight bow distally. These are parallel ridges that traverse the

pattern area and form a curve that is concave proximally. It makes about five percentage of pattern. They can be either plain arch or tented arch.(Table 1)

ii) Loops(L): It is the most common pattern on the fingertip and accounts for about 70%of population. These involves series of ridges enter the pattern area on one side of the digit, recurve abruptly, and leave the pattern area on the same side. The loop pattern is subdivided into two types: ulnar and radial loops .(Table 2)

Based on size and shape they can be classified as large or small, tailor short, vertically or horizontally oriented, plain loop or double loop. Transitional loops can occasionally resemble whorls or complex patterns.

iii) Whorls: It accounts for 25 to 35% of fingerprints. They make a turn through at least one circuit. Subtypes of whorl patterns include:(Table 3)

IV. DERMATOGLYPHIC LANDMARKS

Dermal ridges configuration has be classified into three major group: Tri –Radius, Core and Radiant (Table 4) ⁹
The whorls contain two triradii, while loop possess only one triradius. On the other hand, triradius is absent in arches. Therefore, these patterns may be identified from the occurrence of triradius

V. PALMAR PATTERN CONFIGURATION

To compare dermatoglyphics analyses in different individuals, the palm has been classified into severally anatomically designed thenar areas; 1st, 2nd, 3rd, and 4th interdigital areas; and hypothenar area¹⁰

Ridge counting: Ridges are often counted between triradius and centre or core of the pattern The ridge counts most frequently obtained is between triradii a and b and is referred to as the a–b ridge count. •

atd angle: This angle is formed by lines drawn from the digital triradius (a) to the axial triradius (t) and from this triradius to the digital triradius (d). The more distal the position of “t,” the larger the atd angle. Sometimes, accessory “a” or “d” triradii are present on the palm.

VI. TECHNIQUES FOR RECORDING PATTERNS

Fine quality fingerprints patterns are recorded using different methods as follows¹¹

1. **1.Transparent adhesive tape method:** Dry colouring pigments like chalk, ink or graphite are applied on hands. Strips of Scotch® tape is then used to duplicate the hand prints. The prints are recorded by a process called "Lifting". However, recording of the entire hand with accuracy can be a difficult
2. **2.Photographic method:** Polaroid camera is used to capture the magnified image that is formed based on the principles of total internal reflection It is expensive.
3. **3.Numerical method:** This method requires professional expertise in analysing fingerprints. Algorithm of synthesis of images of fingerprints is used to create all

possible arrangements of ridges called minutiae. The digital coding of the fingerprint helps in assessment and cataloguing all intricate patterns.

4. **4.Faurot inkless method:** Commercially available patented solution is used to record prints on sensitised paper. Shortcoming is availability.
5. **5.Biometrics method:** This procedure involves scanning of hands and palms with a video camera followed by digitizing the print features which are then subjected to analysis. It is an expensive technique

6.Inkpad method: The finger prints are recorded by pressing on the stamp pad turn by turn. The prints are usually smudged and there is loss of clarity.

6.The ink and roller method: This technique was reported by Cummins and Midlo.It utilises printer's ink, commonly known as duplicating ink. The ink is spread on a sheet with a roller, and fingers and palm are pressed onto the sheet. The ink smeared hands are then transferred on paper. This is an inexpensive and rapid method to register clear, smudge free fingerprints. These prints get dried easily and can be preserved for future use. Also, the ink can be easily removed after the procedure. It is most commonly employed to record fingerprints

VII. ADVANTAGES

- Minimally invasive technique,
- Cost -effective,
- Less discomfort to the patient
- Less chair side time
- Data collected remains unchanged lifelong and only minimum equipment's are required

VIII. LIMITATIONS

- Technique sensitive: Appropriate quantity of ink should be dispensed to avoid thick and thin prints
- Genetic deformity, Amputations, and Syndromes affect the registration process.

IX. APPLICATIONS OF DERMATOGLYPICS

Dermatoglyphics are of considerable importance in anthropology, criminology, medicine, chromosome abnormalities such as Trisomy 21, Turners syndrome, Klinefelter syndrome, and also plays a significant role in disease affecting the oral cavity.

X. DENTAL CARIES

Dental caries is a global problem. Earlier detection of dental caries will enable earlier preventive measures. Many studies have reported a significant association between dermatoglyphics and early stages of dental caries. Sharma and Somani¹⁴ reported that dental caries due to abnormality in tooth structures like alterations in the structure of dental enamel, tooth eruption and development may be reflected in dermatoglyphics patterns. A high significant difference in loops pattern and

microbial growth between the subject (caries) and control groups was also noticed. Padma et al¹⁵ in their study evaluated the dermatoglyphic variation and caries activity in deaf and mute children and found an increased frequency of whorl pattern in caries group and increased frequency of loops in caries free group. Chinmaya et al¹⁶ reported that central pocket whorl and twinned loops have an association with an increase in dental caries experience.

Malocclusion –

Malalignment of teeth in both the arches showed a significant variation in dermatoglyphics patterns. This association between Dermatoglyphics and dental occlusion is due to the fact that the development of dentition and the palate occurs during the same period as the development of dermal patterns. Tikare et al¹⁷ assessed the relationship between fingerprints and malocclusion among a group of 696 high school children aged 12-16 years and it revealed a statistical association between whorl patterns and class 1 and 2 malocclusions. However, Reddy et al¹⁸ concluded that arches were found at a higher frequency percentage in class I and class II div I malocclusions, but no significant increase in whorls was noted in class III malocclusions

Precancerous and cancerous lesion

Dermatoglyphics may be of immense clinical significance to segregate those individuals who are at an increased risk of developing these widespread diseases associated with considerable amount of morbidity and mortality. Venkatesh et al¹⁹ did a study to determine the dermatoglyphic pattern in subjects with leukoplakia and oral squamous cell carcinoma and found that among 30 patients diagnosed with leukoplakia, 30.7% had whorls, 6.3% had loop and arch type of finger prints and in oral squamous cell carcinoma patients it was found that 60.7% had loop, 32.3% had whorl, and 7% had arch pattern of fingerprint. Gupta and Kharjodkar²⁰ in their study to analyse the palmar dermatoglyphics in Squamous Cell Carcinoma concluded that an increase in frequency of arch and ulnar loop patterns on fingertips, and decrease in frequency of simple whorl patterns on fingertips, decrease in frequency of palmar accessory triradii on right and left hand. Ganvir and Gajbhiye²¹ suggested that predominance of whorl type of fingerprint pattern would serve as a candidate screening marker for susceptibility to oral squamous cell carcinoma and oral submucosa fibrosis. Munishwar et al²² observed a significant increase in loop pattern among gukta chewers with OSMF when compared to the control group. It was thus concluded that subjects with more number of loop patterns are more prone to develop OSMF as compared to those with other patterns. Punith et al²³ in their study on dermatoglyphics also concluded a significant increase in percentage of whorl pattern in OSMF subjects as compared to control group Hence, dermatoglyphics can be used in this modern era to forecast the future of squamous cell carcinoma and oral submucosis, without much intervention.

Bruxism

Bruxism is the involuntary gnashing, grinding or clenching of teeth. Habitual non-functional forceful contact between occlusal tooth surface can be also studied by using dermatoglyphics. Polat et al²⁴ reported an increase in frequency of

whorls and a decrease in frequency of ulnar loops in bruxism patients. There was lower frequency of atd angle, and no significant difference between the total finger ridge counts (TRC) and a-b ridge counts.

Cleft lip and palate

Craniofacial defects such as cleft lip and cleft palate are the most common of all the birth defects. In humans the development of primary palate and lip is completed by 7th week of intrauterine life and secondary palate by 12th week of intrauterine life. The dermal ridges develop between 6th week of gestation and reach maximum size between 12 and 13 weeks²⁵. Mathew²⁶ in his study on significance of dermatoglyphics in children with oral clefts found an increase in ulnar loop patterns in distal phalanges of ten fingers and an increase in 'atd' angle in oral cleft children. Dziuba²⁷ observed an increase in frequency of ulnar loops and arches and consequent decrease of whorls.

Dermatoglyphics in Patients with Special Needs

A comparative study done among 100 children (50 healthy, 50 mentally challenged) reported an increased frequency of loops and increase palmar crease line were observed among mentally challenged children²⁸

Application In Periodontal Disease

Dermatoglyphics serve as an early forecasting tool in periodontal disease, as genetics play a key role in the onset of periodontitis. Numerous qualitative and quantitative methods have shown inheritance of dermatoglyphics to have great resemblance among monozygotic twins and reasonably strong inheritance among siblings and parents. A study performed by Yilmaz et al²⁹ on 36 early onset periodontitis patients and 20 adult periodontitis patients and 20 periodontally healthy individuals observed that, offspring of chronic periodontitis patients have a high prevalence rate of periodontal breakdown, suggesting a strong familial influence.

Disturbances in the ectodermal layer may manifest itself in both development of skin ridges and the tooth with its periodontium and create a link between dermatoglyphics and anomalies of tooth and periodontium. Hence dermatoglyphics can be used with other diagnostic methods for early detection of patients with distinct group of periodontal disease.³⁰

A Comparative study done by M. Atasu et al⁸ among periodontally healthy subjects and patients with periodontitis, observed that patients with juvenile periodontitis, has decreased frequency of twinned and transversal ulnar loops on all fingers, a decreased frequency of double loops on all fingers and an increased frequency of radial loops on the right second digits of the patients with rapidly progressing periodontitis (RPP), and the increased frequencies of concentric whorls and transversal ulnar loops on all fingers of the patients with adult periodontitis (AP). An increased frequency of triradii on the palms of the patients with Juvenile Periodontitis (JP), increased frequencies of IV and H loops and triradii on the palms of the patients with RPP and an increased frequency of triradii on the soles of the patients with JP were also found. This is also in accordance to the study conducted by Babitha et al³⁰

Soumya et al³¹, reported significant increase in the whorl pattern in chronic periodontitis patients. Among the whorl pattern,

central pocket whorl pattern was significantly increased. And the second most common pattern found in the chronic periodontitis patients was the loop pattern. Among the loop pattern, ulnar loop pattern was found to be increased. However, Kranti K at al³³ in their study stated that in spite of ulnar loop pattern being the commonest in both periodontally healthy and periodontally diseased individuals the findings were not significantly coherent. These studies have proved in formulating counselling messages based on dermatoglyphic pattern prevalent among young generation and their possible stimulation to determine the young people's likelihood to develop chronic periodontitis.

XI. CONCLUSION:

In Periodontology, Dermatoglyphics can be used as a potent bio-indicator for predicting the susceptibility of various diseases like chronic periodontitis due to its genetic nature and wide spread familial tendencies. It also provides a window of hope in establishing more non-invasive techniques and procedures in early diagnosis of periodontal diseases. However, long term studies involving wider range of subjects need to be conducted to help in determining the sensitivity and specificity of the current studies so that dermatoglyphics can be also used as a tool for educating and counselling potential patients about their likelihood to develop various periodontal diseases at a later stage in life.

TABLE 1- Types of Arches

a)Simple or plain arch	Ridges that starts on one side and ridge then slightly cascades upward . A consistency of flow can be observed in this pattern
b)Tented arch	Composed of ridges that starts on one side of finger and flows out to other side in similar pattern.

TABLE 2- Types of Loops

a) Ulnar loop(Lu)	composed of ridges that open on the ulnar side.
b) Radial loop(Lr)	composed of ridges that open on the radial side.

TABLE 3- Different Forms of Whorls

a) Plain/simple/concentric whorl–	Simplest and commonest form of whorl. It composed of ridges that make a turn of one complete circuit which are arranged as a succession of concentric rings or ellipses.
b)Central pocket whorl	a pattern containing a loop within which a smaller whorl is located. These whorl ridge make one complete circuit and may be oval, spiral or any variant of circle They are also classified as ulnar or radial according to the side on which the outer loop opens.
c)Lateral pocket/twinned loop pattern	Pattern composed of interlacing loops
d) Accidentals/complex patterns	These are patterns that match the characteristic of particular whorl subgrouping.

TABLE 4

Tri-radius:	It is formed by the confluence of three ridge systems. Geometric center of triradius is called as tridial point. It forms an angle of 120 degree with another
Core	It is surround by fields of ridges that turn back themselves at 180 degree
Radiant:	They emanate from the tri-radius and enclose the pattern area

Abstract- The ability to think relationally in solving problems is an important goal of school. This is the ultimate goal of teaching that students will be able to make connections between concepts and apply concepts or algorithms in a flexible, accurate, efficient, and appropriate way to solve problems. This research is based on students' difficulties in relational thinking in solving mathematical problems. The purpose of this study was to investigate the relational thinking of students from two eighth grade students in solving problems. They were selected from twenty students with mathematical ability tests and based on sex, the subjects obtained in this study were 2 students of different sexes and had the same mathematical abilities. Then they were interviewed based on their work from the assignment given. When solving problems, male subjects are able to draw problems, determine the core structure of the problem, analyze key elements of the problem. Meanwhile, the female subject knows about concepts that can be used to help the problem, but she does not look for key elements of the problem and she does not know how to determine the solution. These results can contribute to mathematics teachers by helping students use relational thinking in solving problems.

Index Terms- Relational Thinking, Relational Thinking Process, Gender

I. INTRODUCTION

Thinking and solving problems are two things that are difficult to separate. Thinking is a mental activity experienced by someone if they are faced with a problem or situation that must be resolved. Butterworth and Thwaites (2013) state that "when we talk of thinking as a skill we are referring to higher-order activities, such as analysis, evaluating and explaining; and challenges in problem solving and evaluating complex arguments (p. 6). Thinking includes the activity of analyzing, evaluating, and explaining, and for challenges such as problem solving and solving math problems.

Soedjadi (1999: 138) argues that "mathematics is one of the basic sciences, both its applied aspects and reasoning aspects have an important role in efforts to master science and technology". This means that to a certain extent, mathematics needs to be mastered by all Indonesian citizens, both the application and the mindset. That is an important reason why mathematics needs to be taught at every school level, besides that mathematics also plays a role in efforts to develop and train the sharpness of students' thinking in solving problems, especially problems in daily life. Based on the experience of the researcher while teaching at school, students often lack an understanding of the meaning of the story given. Students often cannot associate information that exists in the story matter or with the knowledge they have before. Because of the low relational understanding of students, this also affects students' relational thinking. This means that relational thinking has an important role in helping students understand mathematical problems.

Relational thinking is very important for students. Molina, Castro, & Ambrose (2005, p. 3) stated "This thinking of having a significant number of fundamental mathematical ideas includes relations between different representations of numbers and operations between them". Relational thinking is very important in mathematics because many basic mathematical ideas contain the relationship between the representation of different numbers and the operations between these numbers. Dumas and Hummel (2005, p.73) state "A fundamental aspect of human intelligence is the ability to acquire and manipulate relational concepts. Examples of relational thinking include our ability to appreciate analogies between seemingly different objects or events. This means that the fundamental aspect of human intelligence is the ability to acquire and manipulate relational concepts, one of which is relational thinking. Relational thinking is the ability to understand the analogy between seemingly different objects or events and apply abstract rules in new situations. Thus relational thinking is a mental process that is characterized by building linkages between the elements of information provided with prior knowledge and knowledge of the properties or structure of mathematics in solving mathematical problems.

Hejny, Jirotkova & Kratochviova (2006) states in relational thinking, students create a picture of the problem in their mind as a whole, analyze to find the core structure, and look for some important elements or relationships to build a resolution strategy, whereas those who do not think relationally, students activate several procedures in his mind after identifying the problem

In solving mathematical problems between male and female junior high school students is different. This is because the mindset between male and female students is not the same. This is consistent with what Branata said (in Asmaningtias, 2008, p. 3) which says that women are generally better in memory and men are good at logical thinking. In addition, it is seen that the mathematical abilities between male and female students are also different. As said Macooby and Jacklin (in Soenarjadi, 2011, p. 5) between men and women have the same mathematical abilities during elementary school (SD) until the beginning of adolescence. Starting at around the age of 12-13 years male mathematical skills increase faster than women. Krutetski (in Nafi'an, 2011, p. 574) also explained that differences in male reasoning abilities were superior to women and men had better mathematical and mechanical abilities than women. This difference is not evident at the primary school level but becomes more apparent at a higher level.

II. METHOD

Subjects

To determine the subject of the study, one class was given a test of mathematical ability to see the abilities of students who were equal, and grouped by sex. the next step is chosen by 2 students who have equivalent and different-sex math skills.

Instruments

The main instruments in this study are the researchers themselves and supporting instruments which include audiovisual recorders, mathematical ability tests, mathematical problem-solving assignments and interview guides.

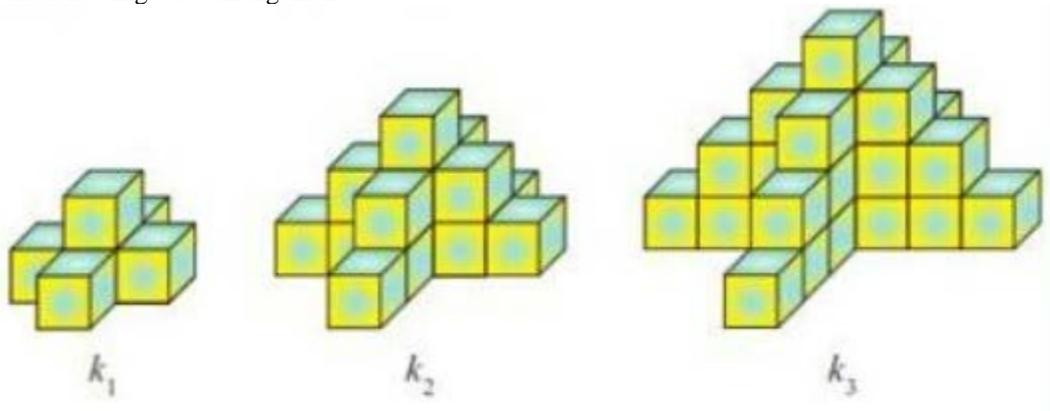

1. Test of mathematical abilities

This test was built by adopting National Final Examination items for elementary schools in Indonesia. Multiple choice forms have been changed to a description of the problem in accordance with the 2013 curriculum content standards for eighth-grade students. The test consists of 5 questions. The prepared examination sheet has been validated by elementary school math teachers (who have received certification) and 2 mathematics education lecturers. Based on the results of the validation, the test sheet is ready for use.

2. Test problem solving

test questions made by the researchers themselves. The tests produced were then validated by certified mathematics teachers from elementary schools and 2 mathematics education lecturers. Validation is in terms of content and use of language. Based on the results of the validation, the test sheet is ready for use. the following problem-solving test questions.

Follow the following cube arrangement!

The number of cube arrangements in k_1 , k_2 , k_3 , and so on increases with the arrangement pattern as in the picture above.

a. Specify many cube arrangements in the next pattern (k_4)

b. Specify many cube arrangements in k_{10} .

c. If the arrangement is painted, how many cubes are painted on two sides? (k_4 & k_{10})

3. Interview Guide

An interview guide was developed to help uncover the subject's relational thinking process when they face mathematical problems.

III. RESULT

Relational Thinking Process Students Male

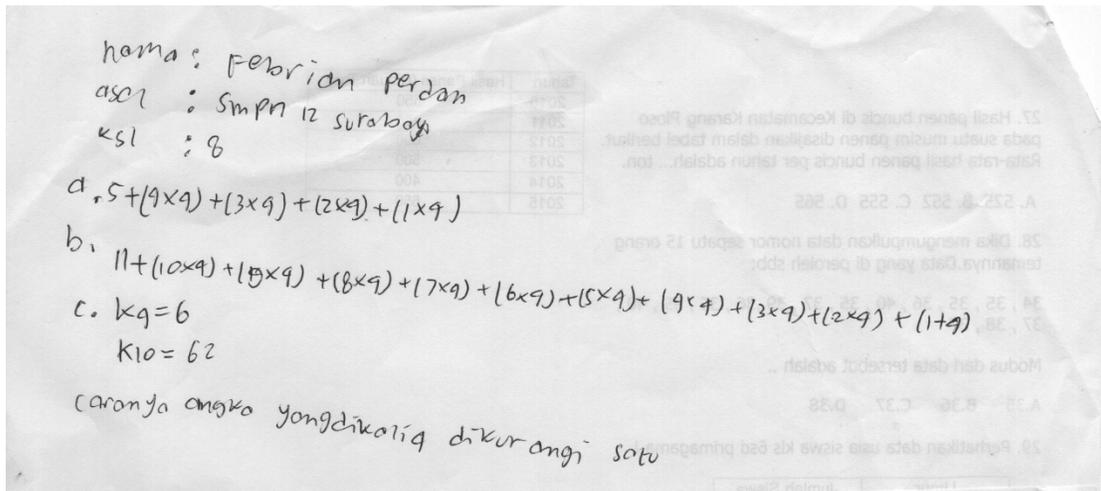

Figure 1. Test Results Of Male Subjects In Solving Mathematical

Based on test results and interview results, in the aspect of making a picture of the problem, the male subject identified the information in the problem. He ignores information that is considered as a supplement because the information has no connection with other information so it is not used in solving problems.

Then, the male subject connects information with the knowledge that is owned and related to the problem given. He connects previously possessed knowledge in interpreting the problems he receives. Furthermore, from the relationships obtained, he has a picture of the problem.

Furthermore, the male subject determines the core structure of the problem. The male subject find the relationship between different parts of the problem and the knowledge they have to solve the problem.

In the aspect of looking for the key elements of the problem, the male subject found a relationship between information obtained with the same sign as with the division operation. In solving problems, male subjects find and use relationships in problems rather than just doing all calculations. This is consistent with what Molina & Ambrose (2006, p.1) says that "when students employ relational thinking, the sentence by focusing on the relativity of numbers in the equation instead of performing all the computations". the male subject made a connection in the problem, he did not apply known procedures to solve the problem.

In the aspect of developing a problem-solving strategy, the male subject makes the steps that lead to solving the problem shown by the male subject by looking for new/additional information first and using that information to solve the problem. the male subject estimates the method to be used for the problem-solving step. In the aspect of implementing the problem-solving strategy, the male subject answers the question with the strategy that has been made.

Relational Thinking Process Students Female

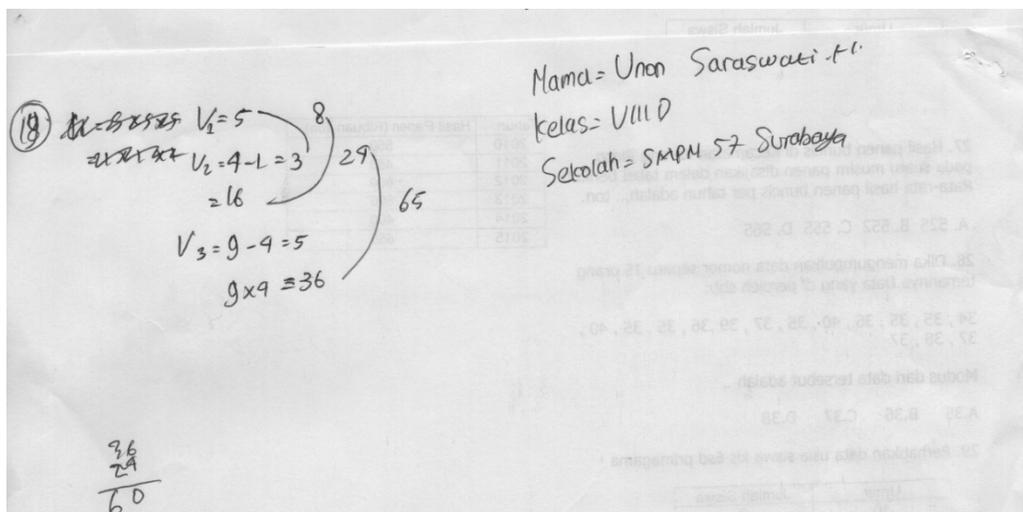

Figure 2. Test Results Of Female Subjects In Solving Mathematical

Based on test results and interview results, in the aspect of building a picture of the problem, the female subject identified information in the problem. the female subject knows all the information on the question either known or asked. the subject of women relates information to the knowledge that is owned and related to the problem given, indicated by linking information with his knowledge of the procedure of completion of comparable worth and reversing value.

In the aspect of determining the core structure of the problem, female subjects find a relationship between different parts of the problem or between information and knowledge they have to solve problems. the female subject connects some information to find new information.

In the aspect of looking for the key elements of the problem, the female subject used a procedure she knew to solve the problem without knowing the procedure was obtained. female subjects do not find the key elements or core relationships of mathematical problems. In the aspect of making a problem-solving strategy, female subjects use procedures that are known to be related to the problem to make a problem-solving strategy. Whereas in the aspect of implementing the problem-solving strategy, the female subject answered the strategy questions made by applying the sequential steps or procedures that have been determined.

IV. CONCLUSION

The male subject fulfils all aspects of relational thinking, namely making a picture of the problem, finding the core structure of the problem, finding key elements, developing strategies, and implementing strategies. while the female subject fulfils four of the five aspects of relational thinking, which the female subject does not do is the aspect of looking for key elements. the female subject does not look for core relationships or key relationships that exist in mathematical problems, she only applies some known procedures to solve problems.

ACKNOWLEDGMENT

Thank you for the Primagama Education Institute Kutisari Surabaya and Surabaya State University providing assistance so that research can be done.

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9209>

Background : Liver fibrosis is a healing process in progressive chronic liver disease. For years, fibrosis was considered irreversible. Over the past three decades, liver cirrhosis has been accepted as a reversible condition. Histologic levels of fibrosis is the main thing in evaluating liver damage, it is also useful for predicting responses to antiviral treatment and also in predicting the endpoint of fibrosis to be able to continue into cirrhosis and end-stage liver complications.

Materials and Methods : Paraffin blocks from 22 patients with benign and malignant liver disease were given reticuline and trichrome massons staining and then assessed for fibrosis stage using the Metavir scoring system.

Results : Each staining gave the same results which were dominated by F3 fibrosis stage which was 9 cases (40.91%). Stadium F0 was not found in this study. Stage F1 in 1 case (4.54%), stage F2 in 7 cases (31.82%) and stage F4 in 6 cases (27.27%). Benign lesions in the liver in this study were dominated by F4 in 3 cases (42.86%) of a total of 7 cases and 9 cases of primar malignant lesions in the liver were dominated by F3 in 4 cases (44.44%). Metastasis lesion was found in 6 cases (27.27%) and in this study were dominated by F3 in 3 cases (50%).

keywords : fibrosis, liver, reticulin, trichrome massons

I. INTRODUCTION

Liver fibrosis is a central pathological healing process in progressive chronic liver disease. For many years, fibrosis was thought to be irreversible. The first notion on the regression of liver fibrosis appeared in the medical literature in 1979, when Perez-Tamayo, analyzing the activity of liver collagenase, presented data supporting that cirrhosis could be reversible. During the last three decades, fibrosis has been widely accepted as a dynamic process with a strong potential for significant resolution. Substantial evidence originated from data showing that successful treatment of the underlying liver disorders, could reverse fibrosis and probably even cirrhosis.¹

Liver fibrosis is a significant health problem, which can ultimately lead to end stage cirrhosis and hepatocellular carcinoma. A wide spectrum of chronic liver injuries, including viral hepatitis, cholestatic liver diseases, alcohol abuse, non-alcoholic steatohepatitis, and nonalcoholic fatty liver disease, can

cause chronic hepatic inflammation and deregulated wound healing process in the liver, which give rise to fibrosis. Liver fibrosis is characterized by excessive extracellular matrix (ECM) deposition and fibrous scar formation. The destruction of the normal liver architecture by fibrous scar and the loss of hepatocytes can prevent the liver from its physiological functions and in the end, result in liver failure.² In Indonesia, chronic liver disease caused by hepatitis viruses (B, C and D). Eighty percent of patients with liver disease, especially those caused by the hepatitis C virus, develop into chronic from mild symptoms that can progress to liver cirrhosis by 20%, and 4% towards long-term liver cell carcinoma.³ World Health Organization (WHO) in 2014 reported that liver disease ranks the eighth most cause of death in Indonesia with a mortality rate of 3.49%, which is around 48,858 people.⁴

II. MATERIAL AND METHODS

A. Patients and samples

This is cross sectional study was conducted on biopsy and surgical specimens which diagnosed benign and malignant lesions in liver were included. The specimens were collected and stored at the laboratory of anatomical pathology of universitas sumatera utara and unit of anatomical pathology in Haji Adam Malik General Hospital in Medan, North sumatera, Indonesia.

B. Reticuline and trichrome massons

Reticuline and trichrome massons staining was performed in 22 paraffin blocks using formalin-fixed and paraffin-embedded tissue sections. Reticulin staining is a special coloring used to show reticular fibers. Reticulin will stain type III collagen The silver metal is able to settle on reticular fibers, and this can be visualized using silver salt. Initially salt will be oxidized by potassium permanganate. Next, metallic silver will be formed from ammonia silver nitrate solution, and will settle as a brownish deposit on the target structure. Formaldehyde, is a strong reducing agent, which will accelerate this process.

Furthermore, when the toning process with gold chloride, silver metal is transferred to a more stable gold compound, which leads to more intensive results. Furthermore, nonspecific silver will be bonded with sodium thiosulfate. In trichrome massons staining method, three dyes are used selectively for staining collagen fibres, muscles, erythrocytes and fibrin. The principle of

trichrome stain is that the smallest molecular size dye stains the less permeable tissues. However, if a large dye molecule is capable in penetrating the tissue, staining will take place in the rate of the smallest molecule. The tissue is initially stained with Biebrich Scarlet (acid dye), which binds to the acidophilic components. Collagen fibres will be stained blue, nuclei stained black and cytoplasm, muscle and erythrocytes stained red. The tissue sections were independently examined by three researchers, including two pathologist.

III. RESULTS

The majority of samples were retrieved from male in 14 cases (63.64%) and 8 (36.36%) from female. The mean (SD) age at diagnosis was 44 ± 13,09 years. Most of the 34 patients were primer malignant lesion in liver in 9 cases (40.91%). (Table 1).

Table 1. Clinicopathological characteristic

characteristic	(n)	Percentage (%)
age		
0 - 10 years	2	9,09
11-20	1	4,54
21-30	2	9,09
31-40	2	9,09

lesions		
benign	7	31,82
primer malignant	9	40,91
Metastasis	6	27,27

This study was approved by National Ethics Committee Medical faculty of Universitas Sumatera Utara.

In this study we was found that fibrosis stage based on metavir using retikulin and trichrome massons staining gave the same results. Each staining was dominated by F3 fibrosis stage in 9 cases (40.91%). Stadium F0 was not found in this study. F1 stage was found in 1 case (4.54%), stage F2 in 7 cases (31.82%) and stage F4 in this study were found in 6 cases (27.27%) (table 2).

Table 2. distribution of fibrosis stage based on metavir with retikulin and trichrome massons staining

Fibrosis stage	retikulin [n /(%)]	trichrome massons [n /(%)]
F0	0	0
F1	1 (4,54%)	1 (4,54%)
F2	6 (27,27%)	6 (27,27%)
F3	9 (40,91%)	9 (40,91%)
F4	6 (27,27%)	6 (27,27%)
total	22 (100%)	22 (100%)

Distribution of fibrosis stages in this study showed that in male there were 14 cases (63.64%). In both stains found the most

C. Metavir scoring system

In assessing fibrosis the Metavir system is relatively simple, categorizing the fibrosis stage in 5 scale levels, namely the scale of 0 to 4. The Metavir system categorizes the fibrosis stage in 5 scale levels namely scale F0 to F4. Fo if no fibrosis was found, F1 if fibrosis was limited to the portal, F2 if portal fibrosis was found with little septic fibrosis, F3 if fibrosis was found at a clear septa, F4 if fibrosis was found at septa and extends to the center.⁵

fibrosis stage in male were F2 and F3, each of which was 5 cases (35.71%). In female we were found eight cases (36.36%) and the most were in 4 cases (50%) (table 3).

Table 3. distribution of fibrosis stage based on metavir by sex

sex	retikulin					trichrome massons				
	F1	F2	F3	F4	total	F1	F2	F3	F4	total
male	0	5	5	4	14	0	5	5	4	14
female	1	1	4	2	8	1	1	4	2	8
total	1	6	9	6	22	1	6	9	6	22

Based on the type of lesions in this study it was divided into 3 types, there were benign liver lesions , primary malignant lesions of the liver and liver metastatic lesions. The results of this study showed that the fibrosis stage in benign lesions in the liver was mostly found in F4, namely as many as 3 cases (42.86%) of a total of 7 cases encountered. This is found to be the same in both reticular staining and trichrome masson. Primary malignant lesions in the liver in 9 cases (40.91%) of the total cases were found. The most fibrosis stage found in stage F3 in 4 cases (44.44%) and the group of liver metastatic lesions found in 6 cases (27.27%) in this study. The most fibrosis stage was stage F3 in 3 cases (50%). The least encountered fibrosis stage is stage F4 in 1 case (16.67%). And in this study no F1 stage was found in malignant lesions that metastasized to the liver. (table 4.)

IV. DISCUSSIONS

Fibrosis is a characteristic feature of accumulation extracellular matrix (ECM) which leads to scar tissue formation and will eventually cause organ dysfunction.⁶ In Indonesia, especially chronic liver disease caused by hepatitis viruses (B, C and D). Eighty percent of patients with liver disease, especially those caused by the hepatitis C virus, develop into chronic symptoms ranging from mild to can progress towards liver cirrhosis by 20%, and 4% towards long-term liver cell carcinoma.⁷ According to Nur Aisyah's research at RSU Dr. Pirngadi Medan in 2002-2006 there were 669 patients with liver cirrhosis. From 251 patients there were 56.6% of patients who had a history of hepatitis.⁸ From the recent research, it was found that the most common cause of fibrosis was nonalcoholic fatty liver disease (NAFLD), which is around 77%. This is much higher than fibrosis caused by hepatitis C which is only about 8% and liver disease which is only caused by alcohol by 8%. Poynard et. al., in the study found that liver fibrosis was generally caused by alcoholic and non-alcoholic fatty liver disease (66%), NAFLD 13%, 9% alcohol, 6% HCV, and 6% other.⁹ In this study the diagnosis of hepatitis was only found in two cases (9.1%) of a total of 22 cases examined for fibrosis stage.

Malignancy cases were the highest in the study, which amounted to 15 cases (68.18%) which were dominated by cases of hepatocellular carcinoma in 5 cases (22.73 %). The average age of patients with liver disease in this study is 44 years with standard deviation 13.09. which was dominated by male in 14 cases (63.64%). This is not much different from the study of Maria L et. al., who conducted the Prevalence of Liver Fibrosis and Its Association with Non-invasive Fibrosis and Metabolic Markers in Patients with Unhealthy Obesity with Vitamin D

Deficiency of 46 cases of liver biopsy found that the average age was 42 years with a standard deviation of 13 years.¹⁰ Fung J et. al., who conducted a study of 1315 patients found that 319 patients (34%) had severe fibrosis. He also found that the overall prevalence of severe fibrosis in patients with hepatitis B in the older age group was seen to increase by 34%. Severe fibrosis in patients aged <25 years is seen as 20% and increases to 81% in patients with patients aged > 65 years.¹¹ Poynard et. al., analyzed 1,312 patients with positive hepatitis C and confirmed by PCR examination from 3 health centers (Paris n 537, Marseille n 601, Bordeaux n 174) found that the average age is 48 years and 58% are male.¹²

Male and female ratio in this study were found to be 7: 4 with a percentage of male in 63.64% cases. This is slightly different from the study of Fung J et al., Found that the ratio of male and female was 39: 42%.¹¹ Research what Maria L et. al., is dominated by women which is as much as 80% of the total cases.¹⁰ This may be caused by factors of habits and lifestyle of the people in this research area and also because of the different number of samples.

In this study both staining reticuline and trichrome massons found that F3 had 9 cases (40.91%) of 22 cases which was encountered in the age range of 51-60 years, in 4 cases out of a total of 7 cases of F3. Stage F4 only found in 6 cases (27.27%) of 22 cases in this study. Most stages F4 are found in the age range of 41-50 years in 2 cases. Stadium F2 in this study found as in 6 cases (27.27%) and the most in the age range 51-60 years in 2 cases. This is slightly different from previous with Maria L et. al., found that of the total cases 30% showed significant fibrosis (\geq F 2) with 9% representing advanced fibrosis (F3) and 4% representing cirrhosis (F4).¹⁰

Benign lesions in the liver in this study found in 7 cases (31.82%) both in reticuline and trichrome Massons staining found F1, F2, F3 and F4 fibrosis respectively 1 (14.28%), 1 (14, 28%), 2 (28.57%) and 3 (42.86%) cases. Poynard et. al., who observed the distribution of natural fibrosis stages in patients with chronic hepatitis C who had liver biopsies of 2235 cases. The prevalence of fibrosis was F0 10%, F1 36%, F2 21%, F3 15%, and F4 18%. While patients who were reconfirmed with the Polymerase Chain Reaction (PCR) examination of 1312 cases he found the prevalence of fibrosis stage was 11% for F0 (n 141), 40% for F1 (n520), 22% for F2 (n 295), 16% for F3 (n 208), and 11% for F4 (n 148).¹² This is probably due to the fact that the number of samples in this study was only 22 cases, and it can also be because early detection of fibrosis in liver disease using biopsy is still minimal in the institutions where this research was conducted.

In this study 15 cases (68.18%) of malignancy were found. Six cases (40%) of them were metastatic cases from other places to the liver. Fibrosis stage in malignancy cases in both reticuline staining and Trichrome Massons staining was dominated by F3, in 7 cases out of 15 malignancy cases (46.66%). F2 in 5 cases (33.33%) and F4 remaining 3 cases (20%). In this study, most fibrosis stage in benign lesions was found in stage F4 and most malignant lesions was stage F3. This shows that in this study fibrosis trips in benign lesions continued and did not receive good treatment so that the fibrosis stage to be able to continue into cirrhosis and end-stage liver complications. Cirrhosis. And in this study most of malignant lesions was stage F3 this

indicates that malignancy should not be preceded by cirrhosis (F4) malignancy can take place when the liver does not have fibrosis or at the time of fibrosis at a low stage Radisky et. al., states that increasing the expression of MMP matrix metalloproteinase can stimulate fibrosis, tumorigenesis, and also the development of tumors by inducing extracellular matrix especially in transdifferentiate epithelial cells and causing myofibroblast to be activated. This connection provides a new perspective on the development of micro-fibrosis and tumor environments.¹² Fibrosis is strongly associated with cancer which affects tumorigenesis, metastasis and inhibits drug delivery to the tumor. Early detection of fibrosis provides a great opportunity for the management of fibrotic disease.¹³

V. CONCLUSION

In this study, the use of reticulin staining and staining of trichrome massons showed no difference in assessing fibrosis stage using the metavir scoring system. The most common fibrosis stage in this study is stage F3. Most cases are in the sixth decade of life and more men are found with a ratio of 3.5: 2. In this study, fibrosis stage in benign lesions was found in stage F4 and in most malignant lesions found was stage F3. Fibrosis is also associated with cancer which affects tumorigenesis, metastasis and inhibits drug delivery to the tumor.

COMPETING INTERESTS

The authors have no relevant financial interest in the products or companies described in this article.

ACKNOWLEDGMENT

The authors are grateful thank for all the spirit criticals to the other pathologists, Lubis MND, Lukito JS, Alferraly TI, Delyuzar and all of the medical staff in Anatomical Pathologic Laboratory at Faculty Medicine in Universitas Sumatera Utara. And thank to Savitri E, The radiolog for your contribution in this study.

ABSTRACT:

A growing body of opinion suggests that historic buildings promote different values to communities through adaptive reuse. The government of Tanzania has allowed historic buildings in Bagamoyo to be reused to promote sustainability in the community. This paper examines how adaptive reuse of historic buildings helps to promote social values the society cherishes and seeks to promote. The data were collected using a survey research designed to allow respondents to express their own understanding of how adaptive reuse of historic buildings impacts on promoting different values attached to historic buildings especially social values. The findings indicate that adaptive reuse helps to promote social values which are social interaction, change of attitude, change in lifestyle, and change in behavior of the society. Although these social values have been acquired differently by each way of adaptive reuse, restoration seems to be important in promoting change in attitude towards preservation and conservation so as to promote economic values. However, generally from relative score algorithm through average mean of their scores if both ways are combined, they show that adaptive reuse is better to promote social values above cultural values by 1.04 but below economic values by 0.94. Regression analysis indicates that most key players are interested to adopt these historic buildings when there is a chance to promote social values which will help them to also generate economic values and increase more profit and acceptance of their project in the society.

Keywords: *Adaptive Reuse, Historic Buildings, Historic Building Values, Relative Score Algorithm*

I. INTRODUCTION

Historic buildings have become an important element as iconic to the city and need to be conserved [1]. Adaptive reuse is the process that retains as much as possible of the original building while upgrading the performance to suit modern standards and changing user requirements [2].

Adaptive reuse of historic buildings has been an important strategy to preserve historic buildings which acts as a symbol of heritage and as an effective strategy to improve the sustainability of existing buildings [2-6].

Adaptation has been seen as a way to improve social values as well as economic values in many countries [7]. Consequently, it is asserted as a strategy to promote sustainability but it's remarkable to see to what extent it will be able to improve social values because many investors and developers are interested in economic values to gain profit from adaptation and reuse of historic buildings rather than social values [8].

Adapted building will not completely match a new building in terms of performance, although the shortfall should be balanced against the gains in social value. The life expectancy of an existing building may also be less than a new alternative

despite any improvements that adaptation may inject [9]. Old buildings also express the continuity of human society as they are symbolic of their permanence, and as expressive of the deep roots of society as a late Graeme Shankland, an architect and planner, once said that “a city without old buildings is like a man without a memory [10].

Social values have become difficult to capture because a myriad of investors prefer more economic values in case of location, site, special character and neighborhood factors which mostly influence economic benefit and avoid diminished of potential market due to intense competitive pressure from other investors [8, 11].

For example in developed countries, in the case of Ontario, Canada, older buildings are important aesthetic, cultural and economic resources but in many jurisdictions hundreds of historic buildings have been demolished because developers and bankers argued that the cost of adapting them for new uses is too high but this is the only way for investors to make a reasonable profit from the use of the land [11]. In Tanzania adaptive reuse of historical building is argued to improve preservation in an effort to prevent undue deterioration of heritage features. Many historical buildings in Bagamoyo have experienced rapid deterioration of building materials caused by lack of maintenance, climatic condition, ageing of materials, use of incorrect or faulty materials for repair, poor workmanship and inherent structural design defects [12]. Barriers and challenges of adaptive reuse have allowed a good number of historic buildings in Bagamoyo to fall into a state of disrepair and dereliction [13]. However, the adaptive reuse of a few old buildings in the same area like Old Post Office has proved to be an important component in the revitalization of the neighborhood. Though modifications have been done, but the dynamic heritage features through which the buildings have passed can still be observed [14]. Although social values are essential parts to the community, most key players tend to ignore social values when preserving the dynamic heritage features of historic buildings.

II. LITERATURE REVIEW

Adaptive reuse is a conversion of a building to undertake modified change (Douglas, 2006). Adaptive reuse is like giving the buildings the second life when they may be previously underutilized [15, 16]. Changing building from underutilization to different purpose has become necessary to preserve heritage buildings [15]. When done well, adaptive reuse can restore and maintain the heritage preservation and restoration of historic buildings which actually increase their historic and cultural values [9]. However, many investors decide to demolish heritage building rather than preserve them based on their economic values with little regard for other values, sustainability and their historical importance to the community [17]. Adaptive reuse and the conservation of heritage buildings play a critical role for obtaining significant economic, cultural and social benefits to the communities [11, 18 - 21]. Adaptive reuse doesn't just concern about economic values, but it also provides social and environmental to the community [15]. Therefore having a large number of vacant or derelict buildings has negative impact to the society and provides an environment for crime and other antisocial behaviors [17].

Although it's problematic to determine the values [22] of adaptive reuse of historic buildings numerous investors and developers still make their decision about adaptive reuse with consideration of higher profitability and high rate of return on their capital investment asset while important issues associated with the environment and social values are given less priority. In particular the adaptive reuse has been identified as a process that can significantly improve the financial, environmental and social performance of existing building assets [15]. The process of adaptive reuse can be used as a strategy to change the need of owners and occupiers and the community in general [4, 9].

Sustainable development through adaptive reuse raises the importance of building stock as economic, social and cultural capital that should not be wasted [15, 23]. However adaptive reuse is often perceived by some as expensive and sometimes requiring substantial and costly refurbishment [15, 24]. Regardless of the cost adaptive reuse of the building has a major role to play in sustainable

development of community both socially, economically and environmentally [25]. [8, 18, 21] adopt the views that few of the out-dated features of historic buildings will ever match current sustainability standards which means building owners see no socio-cultural, physical and economic value benefits of embracing adaptive reuse of historic building and this leads to diminished potential market of the adaptive reuse of old buildings.

In the case of developed countries [26] confirms that Australia heritage buildings form an integral part of Australia social capital. Within Australia conserving heritage buildings provides significant economic, cultural and social benefit [9]. Heritage buildings provide a valuable glimpse of the past and therefore should be conserved for future generations [25]. The strategy that promotes environmental, social, cultural and economic sustainability of buildings of historical significance to be adapted and reused rather than demolishing them has become a very relevant topic in developed countries [3; 17].

Adaptive reuse when applied to heritage buildings not only retains the building, but conserves the efforts, skill and dedication of the original builders [6, 17]. The outcomes of adaptive reuse should include improvement in the material and resource efficiency (environmental sustainability), cost reductions (economic sustainability) and retention (social sustainability) [27]. Adaptive reuse also needs to conserve the heritage value of prestigious, monumental or historical significant values of buildings [23]. The practical outcome of adaptive reuse and the conceptual values of conservation support the reuse of heritage buildings as a sustainability strategy [28, 22 and 29].

Adaptive reuse not only involves the preservation and restoration but also conservation [30] that aims to safeguard the quality of values of the resources [31]. Conservation and preservation share a concern about adaptive reuse. While conservation is associated with the protection of material, historical and design integrity of historic buildings through carefully planned interventions, preservation refers to the set of activities aimed to prolong the usable life of historic properties with little changes to the

original state [32, 33]. The preservation often talks about “value” of historic properties: the social values, the cultural values, aesthetic values, urban context value, architectural value, historic value, and the value of a sense of place. But one of the strongest arguments for preservation ought to be that; a historic building has multiple layers of values to its community [34]. The desire to preserve must ultimately be a rational economic and commercial choice and not just a consequence of legal and land use planning controls [31]. Historic buildings are part of the real estate market (economically) and as such they need to be left alone to adjust their prices to profitability in a free market economy; such argument ignores the social needs of the community and positive externalities from historic preservation [35].

Even in fast developing countries like Malaysia, many historic buildings have not been well conserved, thus most of them are in poor condition [36]. Likewise in developing countries like Tanzania most historic buildings are in poor condition and others are beyond repairs [12, 30]. To address the problem adaptive reuse is seen as an important strategy to reduce demolition waste and extend the useful life of the building, encourage reuse of the embodied energy and also provide significant environmental, social and economic benefit to the community [37]. The study by [38] indicates that indeed adaptive reuse is slow in developing countries but can offer economic, social and cultural benefits to their environment and is one approach to sustainability.

It is the fact that adaptation is affected by owners’ more interests in economic values more than social values [39]. The owners of historic buildings, mostly demand for economically viable adaptation to gain more return on investment for adaptive reuse of historic buildings [40, 41]. The owners and developers need to change their mind when making decisions because adaptive reuse can be used as a strategy to achieve both economic values and social values to the community, even though the process can be costly expensive for developers and owners due to heritage and conservation requirements [4, 9 and 22].

Adaptive reuse helps to conserve the architectural, social, cultural and historic values [2]. Historic buildings have an important role to play in stimulating economic growth supporting local communities and accounting for social values [42]. The sense of the past and promotion of the harmony of individual and social life in the areas concerned are realized by conservation [43]. Adaptation of historic value will help to improve both cultural and economic values associated with cultural heritage [44].

III. RESEARCH METHODOLOGY

The data presented in this paper were collected using a survey research designed to allow

respondents to express their own understanding of the impact of adaptive reuse of historic buildings on promoting different values attached to historic buildings especially social values. The questions were open ended revolving around the process of adaptive reuse to promote values of historic buildings i.e. social values, cultural values and economic values. Thereafter the responses were classified on a five level “categorical” scale based on interpretative approach. Indeed the values were categorized to be on a “Likert” scale, in such a way that the values attached to them were so different to reflect a continuum of the same phenomenon. Table 1 explains the codification of survey responses from individual.

Table 1: Codification of Survey Responses

S/No.	Interpretative Code	Responses		
		Social Values	Economic Values	Cultural Values
1.	Very Bad	Social interaction, attitudes, behaviours, technical knowledge (skills)	Use: space value, aesthetic value, environmental value, tourism, architectural value Non use: Historic legacy, uniqueness value	Cultural beliefs, stories, customs, intergeneration values
2.	Bad	Social interaction, attitudes, behaviours, technical skills	Space value, aesthetic value, architectural value, environmental value	Cultural beliefs, stories, customs, intergeneration values,
3.	Normal	Social interaction, attitudes, behaviours, technical knowledge	space value, aesthetic value, architectural value uniqueness value	Cultural beliefs, stories, customs, intergeneration values,

5.	Very Good	Social interaction, attitudes, behaviours, technical knowledge (skills)	space value, aesthetic value, architectural value, Historic legacy	Cultural beliefs, stories, customs, intergeneration values,

IV. DATA COLLECTION

Data collected was mainly primary data collected directly from first hand experience. The data was collected from key players of adaptive reuse which are both investors and developers from both private owned and government owned, and individuals around those historic buildings with purposive

sampling technique to select the required responded to ensure objectivity of the study is made [45].

V. DATA ANALYSIS

Relative score algorithm and Pearson’s correlation coefficient was used to evaluate the degree of relationship among variables. Relative score

algorithm was used to determine which way of adaptive reuse is better than another way where the value with the highest score of 1 was considered the best on that way. Pearson’s correlation coefficient was used to analyze the relationship between dependent variable and independent variables whereby +1 means strong relationship and -1 means weak relationship and 0 means there is no relation between adaptive reuse and that factor.

Relative score algorithm results encompassing ways of adaptive reuse which has an influence on different values associated with historic buildings are shown in Table 2. The best score is 1 representing the best way of adaptive reuse though generally the average mean of the relative score was calculated to show which values are best performed with the both ways of adaptive reuse. The scores under 1 have been below the relative score, but they also seem good in different ways among the three ways of adaptive reuse.

VI. RESEARCH FINDINGS

Table 2: Relative score algorithm; ways of adaptive reuse

Adaptive reuse	Values	Values	Mean Score	Ranks	Relative score	Ranking	Overall Rank	Average mean
Preservation	Cultural Values	stories	2.07	5	0.84	3	7	2.34
Preservation	Cultural Values	symbolic value	2.38	8	0.96	5	13	
Preservation	Cultural Values	local meaning value	2.57	13	1.04	7	19	2.59
Conservation	Economic Values	Uniqueness value	1.54	1	0.62	1	1	
Restoration	Economic Values	aesthetic value	1.92	3	0.78	1	1	2.42
Preservation	Economic Values	integeneration value	1.98	4	0.80	2	4	
Preservation	Economic Values	architectural values	2.14	6	0.87	4	10	2.42
Restoration	Economic Values	tourism	2.38	7	0.96	2	4	
Conservation	Economic Values	Recreation	2.43	9	0.98	2	4	2.42
Preservation	Economic Values	historic legacy	2.46	11	1.00	6	16	
Conservation	Economic Values	aesthetic value	2.48	12	1.00	3	7	2.42
Restoration	Economic Values	space value	2.84	16	1.15	4	10	
Restoration	Economic Values	economic value	2.87	17	1.16	5	13	2.42
Preservation	Economic Values	Environmental value	3.00	18	1.22	9	20	
Preservation	Economic Values	Income level	3.08	19	1.25	10	21	2.42
Conservation	Economic Values	Environmental value	3.16	20	1.28	5	13	
Conservation	Economic Values	Income level	3.23	21	1.31	6	16	2.42
Restoration	Economic Values	Environmental value	3.31	22	1.34	6	16	
Preservation	social Values	customs	1.84	2	0.74	1	1	2.42
Restoration	social Values	Attitude	2.46	10	1.00	3	7	

Conservation	social Values	Action	2.66	14	1.08	4	10	
Preservation	social Values	Attitude	2.75	15	1.11			1.04
			2.47					0.94

Indeed, Table 2 results clearly explain the relationship between the values of historic buildings and ways of adaptive reuse. It seems that restoration is the best way among the other ways to promote one of the social value which is changing the attitude of the individual about the process of adaptive reuse through restoration of historic buildings, and conservation is the best way to promote one of economic value which is aesthetic value of the building to ensure that the building looks nearly as it was during the construction or appears better whereas preservation helps to protect the historic legacy of a building.

But coming to the overall performance of both ways to understand which values the adaptive reuse protects above the other ways, the average mean of relative score was calculated and then the comparison was made for both social values,

economic values and cultural values. For social value the average mean of a relative score was 2.42, the average mean of a relative score for economic values was 2.59 and the average mean of a relative score for cultural value became 2.34 which by interpretation, both ways promote social values above cultural value by an average mean of 1.04 but below economic value by 0.94. This indicates that the adaptive reuse ways help to promote social values in the society, though, according to the individual’s response it’s below economic values and above cultural value.

Correlation was calculated to show the relationship between adaptive reuse and historic building values on how key players (investors and developers) of adaptive reuse are mostly interested in adaptive reuse and understand which values are mostly important to them as shown in Table 3.

Table 3. Definition of variables.

Variable	Description of variables
Adaptive Reuse	Adaptive reuse
A.V	Aesthetic value
Unique	Uniqueness value
Inco.V	Income level
So.I(actions)	Social interaction
Envi.Value	Environmental Value
Recre.va	Recreation value
Eco.V	Economic value
Tourism.A	Tourism attraction value
Space.V	Space value
Attitude	Attitude
Symbolic	Symbolic value
Stories	Stories value
Historic.L	Historic Legacy value
Loc.Meang	Local meaning
Intege.V	Intergeneration value
Customs	Customs
ARC	Architectural value

Table 4 shows that the correlation between the values range from -1 to +1 whereby -1 is perfectly

negative linear relation and + 1 is perfectly positive linear relation and 0 means there is no linear

relation. However, upon computation most values exhibited both positive and negative linear relationships with adaptive reuse. The Table 4 shows that adaptive reuse has a strong positive relation in promoting economic value by 0.88 and also has a strong positive relation with aesthetic value by 0.63. Social interaction has a strong positive relation to adaptive reuse where most ways of adaptive reuse help in promoting social interactions and highly positive correlation with attitude by 0.85. However, it seems to have a low negative relation with recreation value and tourism

attraction by -0.08 and -0.10 respectively. Other values also have negative correlation which are as follows: symbolic (-0.10), stories (-0.09) historic legacy (-0.06) and customs (-0.02). Key players of adaptive reuse are mostly likely to be involved in adaptive reuse because it's likely to promote social values in the society which is mostly important because as the society accepts the activity and also helps to promote social values, many individuals will be interested to accept the activity and this will increase their profit.

Table 4: Relationship between adaptive reuse of historic buildings and values associated with historic buildings

Significance of adaptive reuse to promote values of historic building

The study has indicated that adaptive reuse is an effective strategy to influence many values in the society through different ways. Although the process of adaptive reuse influences a myriad of social values, individuals in the society have shown the impact addressed by adaptive reuse as follows (Table 5).

Social interaction

Most survey respondents (49 percent) showed that complete restoration to adaptive reuse is a very

good way to increase the social interaction in the society because individuals living near the historic buildings interact together through works associated with adaptive reuse. On the other hand only 7 percent of respondents did not agree, and believed that adaptive reuse is the worst strategy. Furthermore, most respondents expressed sincere appreciation to the government that decided in 2010 to restore old market and gave it to individuals to work at that place for their artistic activities; the move that increased the social interaction among the individuals working there and those living around the market.

Attitude

Individuals in the society believed that the process of adaptive reuse has changed their attitude over historic buildings, whereby most of the buildings were left without development and ended up in bad condition beyond repair. For example, Old Boma and Old Market were once believed to belong to the government and not for the purpose of the community, but only after the restoration of these buildings the individuals' attitudes changed and believed that these buildings can help the society through many ways by providing employment opportunities like the case in point of old market. This change of views was supported by 51 percent of the respondents who agreed that adaptation is a better method and only 7 percent explained is a bad method to promote social values because a few number of people are involved in the exercise.

Customs

Majority of people living in the area believed that, though adaptive reuse is not a very good method to change the customs of individual, but believed it is a good method to conserve historic buildings. Only 30 percent of the respondents believed adaptive reuse to be a very good method to promote customs, 56 percent agreed that it is a good method to promote customs and only 5 percent said it is the bad method to promote customs and none said it is a very bad method and this shows that adaptive reuse has an impact on promoting customs in the society though not in a very good way but in a good way anyway.

Economic values

These comprise both use and non-use values. Non-use values are the values individuals are willing to pay to obtain them though they might also benefit indirectly rather than directly [46]. These are values which are kept for the future generation where the use of today will not compromise the use of future generation [47]. The respondents had an opportunity to rate the significance of adaptive reuse on both use and non-use economic values as explained below:

Aesthetic values

This is part of economic value found in non-use values whereby many respondents in the field agreed that adaptive reuse has an impact on aesthetic value. 39 percent agreed that adaptive reuse is a good method to promote aesthetic value and only 10 percent of the respondents explained it as a bad method.

Respondents confirmed that the level of tourism has been increasing day by day and most of them gave the reason that the historic buildings are adaptively reused through different ways, such as restoration, preservation and conservation. 48 percent of the respondents agreed that the process of adaptive reuse has shown the significance of increase of tourists in the district of Bagamoyo and only 7 percent said it is a bad strategy.

Space value

Space value is the value given to the buildings after the process of adaptive reuse, whereby, according to respondents buildings which have been given space value for other activities in the case study area are Arabic tea house which is used as offices for the municipally and acts as a department of education in Bagamoyo district, Old Post Office which is now a Millennium Hotel, Old Market used as a market of arts, Mwambao primary school used as a primary school, Old Fort used as an office for management of all historic buildings, and Caravan Serai used as an office of antiquity department. 25 percent of respondents agreed adaptive reuse is a good approach to promote space value, 20 percent of them said is a bad strategy because most of the space provided is not of benefit to the individuals, except in few cases like Old Market building and Mwambao primary school which have positively benefited them. Many respondents suggested that citizens need to be given chance to invest in those buildings to promote social values instead of non-indigenous developers and investors who are only interested in making profits.

Environmental value

The environment around the historic buildings which undergo adaptive reuse benefits individuals through reduction of waste and reuse of materials. 38 percent of respondents believe that environment value has increased, and is in very good state, but

26 percent of them said adaptive reuse doesn't promote environment value. The case in point is of people working in Old Market building who explained that the environments are in very bad condition, because of absence of social services like toilets in the place and very poor infrastructure. Likewise, the environment condition around Old Boma is very poor because the building has been put at risk through neglect for a long time without any improvement.

Recreation purpose (non-use value)

The recreation purpose is one of the non-use values, whereby individuals are willing to pay to enjoy the view and visiting these historic buildings after adaptive reuse. Many respondents explained that they are mostly interested to visit these historic buildings after adaptive reuse. 43 percent of the respondents expressed their attraction to adaptive re-use of historic buildings like the Old Boma which is under renovation and once finished it will be the best building in Bagamoyo and majority will be attracted to visit it.

Income level

Appropriate adaptive reuse of historic building can result in generation of income. However 33 percent of the respondents believe that adaptive reuse is a very bad method in promoting income level because most of the buildings that undergo adaptive reuse do not save the individuals in the society, but rather benefit the developers and investors, together with the government. Only 32 percent of the respondents believe it's the very good method to increase their income.

Cultural values

These are values which are passed from one generation to another generation and are preserved and kept in the society; these are explained below.

Symbolic value

Many historic buildings in Bagamoyo feature a variety of symbols mostly displayed in various

forms of carving on doors and windows representing the skills and wisdom of the traditional craftsmen. Many respondents in the region of 41 percent believe that the adaptive reuse is the very good method to protect these symbols and only 7 percent of the respondents say it's the bad strategy. A particular building cited by many respondents is Caravan Serai which is meticulously conserved with historic symbols that remain as the legacy and history of the slave trade.

Historic legacy value (option value)

Adaptive reuse of historic buildings can help buildings create a distinct historic legacy, identity and character. Many respondents in Bagamoyo believe that if the historic buildings are kept in good condition they will remain a legacy to the coming generation and will be reminders of different stages of life experience they have passed through. 41 percent of the respondents believed adaptive reuse is the best strategy to promote historic legacy value and only 5 percent of the respondents believe that it is the bad strategy.

Intergeneration value

52 percent of the respondents explained that adaptive reuse is a good method, but is not a very good method because they believe that the buildings will continue to decay and in the future there will be no building left. Only 3 percent of respondents said adaptive reuse is not a good method to preserve the value.

Architectural value

Architectural value refers to the look, feel and functionality of the design of the building. 42% of the respondents agreed that adaptive reuse is the very good and good method to promote architectural design, style and material and none of the respondents said it is the bad process and this is due to the reason that historic buildings have remained for so long in the way they were left by the colonies in terms of design, style and material.

Table 5. Summary of significance of Adaptive reuse of historic buildings on values.

VALUES	TOTAL	Very Good(%)	Good (%)	Normal (%)	Bad (%)	Very Bad (%)	TOTAL	Total Weight Score	Relative Importance Index(RII)	Rank
Attitude	59	51% (30)	10% (6)	25% (15)	7% (4)	7% (4)	100%	235	0.7966	6
Customs	61	30% (18)	56% (34)	10% (6)	5% (3)	0% (0)	100%	250	0.8197	3
Social interaction	61	49% (30)	20% (12)	16% (10)	8% (5)	7% (4)	100%	242	0.7934	7

Architectural value	59	42% (25)	42% (25)	8% (5)	7% (4)	0% (0)	100%	248	0.8407	1

VII. CONCLUSION

This explanatory study has managed to reveal valuable findings that are important to the key players of adaptive reuse which are investors and developers with more values to consider during making decision about adaptive reuse of historic buildings and how individuals in the society respond to the changes. The study finds that, if done properly, adaptive reuse of historic buildings can have a significant positive impact on the economic socio-cultural, and economic, values. The values which are mostly important to the individual about adaptive reuse are those that they help to promote social interaction among the society, change attitude, improve lifestyle, increase tourism attraction, increase aesthetic values as well as

architectural values. The adaptive reuse of historic buildings, however, requires a fundamental shift in how people in the local communities are tacitly involved in creative acts of adaptation.

DOI: 10.29322/IJSRP.9.08.2019.p9211

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9211>

Abstract - This paper investigates the relationship between the unemployment rate and economic growth in Nepal. Gross Domestic Product (GDP) at constant price has been used as an indicator of economic growth. The data regarding GDP and unemployment rate were collected from World Bank database for the study. Correlation and Regression analysis were used to study the nature and degree of effect of economic growth on unemployment rate. It was found that there is a strong negative correlation between economic growth and unemployment rate. Also, it was found that GDP accounts for 48.6% of cause of change in unemployment rate. The findings are in line with the Okun's law.

Index Terms— Unemployment; Economic Growth; Gross Domestic Product; Okun's Law.

INTRODUCTION

Persistent increment in unemployment rates have become burning issues for most of the developing economies today. However, unemployment is pervasive and is experienced by all economies of the world in some form and degree. While looking at the global scenario, unemployment statistics show that 4-6 per cent of the total working population of the USA, UK, Japan, China and India are unemployed. In the Middle East and North Africa, unemployment remains the highest (Acharya, 2014). According to the ILO (2018), 192 million workers are jobless in the world, and the numbers are rising much faster than new jobs are being created. Besides, after the recent Global crisis, there are strong doubts about that unemployment is related to economic growth such that economic growth does not create employment as much as it did before [Barışık et al. (2010) and Demirgil (2010) as retrieved from Aksoy (2013)]. Unemployment rate is often seen as an indicator of the efficiency and effectiveness of an economy to absorb its labor force and of the performance of the labor market. (ILO, 2013). Thus, reducing unemployment and achieving a high rate of

economic growth have become the foremost priorities of each developed and developing economies currently.

According to Nepal Labor Force Survey- 2017/18, for a person to be considered unemployed, three criteria must be met simultaneously: the person must be completely without work, currently available to work, and taking active steps to find work (National Planning Commission Central Bureau of Statistics, 2019). The unemployment rate is calculated by expressing the number of unemployed persons as a percentage of the total number of persons in the labor force. And the labor force, also known as the economically active population, is the sum of the number of persons employed and the number of person unemployed (International Labour Organization, 2013). Thus, the measure of the unemployed percent needs the measure of both employed and unemployed. Economic growth is another indicator of welfare of a country. According to Phan (2006) economic growth is an increase in overall output of an economy in a given period. Thus, it can be understood as an increase in GDP or GNP or personal income in a given period. Economic growth reflects a quantitative change in an economy.[as retrieved from Manh et al. (2014)]

If employment and growth rates are considered, Nepal is seen performed poorly on both growth and employment indicators. Growth in the last 35 years (1975-2010) has been merely 4 per cent on average, with agricultural and non-agricultural sectors growing at a rate of 2.5 and 5.6 per cent respectively (Khanal et al., 2012). During the last three years (2010-2013), the growth rate has remained almost the same, with further deceleration in the growth of the non-agricultural sector at 4.8 per cent on average (NPC, 2013). The performance of the employment sector has been even poorer. Unlike the growth of employment at a rate of 2.7 per cent during the period of 1981 to 1991, such a growth rate has decelerated to just 0.66 percent during the period 2001-2011 (CBS, 2012).

Nepal is seen putting in a lot of effort to decrease unemployment.. When a new government comes to power, the main agenda becomes creation of employment opportunities.

Unemployment is a headache to all governments. (Acharya, 2014) Prioritization of employment generation in different national plans, policies and program such as Karnali One Family One Employment-2006, Youth Self-Employment - 2008 and Prime Minister Employment-2019, establishment of employment notice centers, provision of sector-specific and micro-level skills and enterprise development, focused group training and income generation program, etc are some of the few to mention. The irony, however, is that despite the increased focus on productive employment in recent years, unemployment and underemployment have emerged as the biggest problems today (ILO, 2013). When the facts are analyzed, no progress on the line can be seen. National Labor Force Survey (NLFS)-I estimated that 1.8 percent or 178.0 thousand people aged 15 years and above were unemployed in the year 1998/99 whereas it was estimated to have increased to 2.1 percent or a total of 252.8 thousand during NLFS-II for the year 2008/09. And now the latest labor force survey indicates the unemployment rate has risen to 2.3 percent with semi-unemployment rate of 30 percent. Similarly, the youth underemployment rate is 35.8 percent. (National Planning Commission Central Bureau of Statistics, 2019). With such increment in the unemployment situation, it is quite difficult to manage the economy. Adverse labor market conditions have resulted in very high labor mobility and migration, both internal and external, in search of jobs and employment opportunities. One in each four households (25.42%; 1.38 million households) reported that at least one member of their household is absent or is living out of country. Total number of absent population is found to be 1,921,494 against 0.76 million in 2001. The highest proportion (44.81 percent) of absent population is from the age group 15 to 24 years (CBS, 2012). Gil-Alana (2010) has identified that public attitude is positively influenced by governmental responsibility. It has also been described that due to higher long term unemployment rate, people have more negative attitude towards governmental provision for unemployment.

Thus, this study is conducted with aim to study the effect of economic growth on unemployment rate in Nepal post 1960. Also, the study will test whether the case of negative relationship between economic growth and unemployment, as stated by the Okun's law holds true for Nepalese context or not.

II. LITERATURE REVIEW

Based on a number of country case studies, there is a growing realization that job creation is necessary for boosting living standards, raising productivity and fostering social cohesion, leading to a country's overall development (WB, 2012). Many recent studies have broadly concluded that the pattern of growth taking place in most of developing countries has been detrimental to enhancing employment led inclusive growth and development. (Khanal D. R., 2015) It has also been

conceded that job creation and inclusive growth are imperatives that resonate today in every country in the world - be it small, large, advanced, emerging, developing, post-conflict or resource rich (IMF, 2013)

With respect to studies regarding the relationship, Okun's Law stands as the strongest dominant foundation. Okun (1962) established a relationship between economic growth and unemployment and put forward: GDP decrease by 3 percent point as unemployment rate increase 1 percent point over the natural rate of unemployment. And till date, Okun's Law has gained wide acceptance in the literature too.

Seyfried (2003) when examined the nature of the relationship between employment and economic growth in the ten largest states of United States, found that though economic growth has a positive and significant impact on employment growth, some of the effects take a few quarters to be fully felt. It is because persistence in employment growth plays a major role as well. Thus, economic growth may have to occur for a period of time before it can have a noticeable impact on the labor market.

Akter (2017) tested the relation between unemployment and economic growth using a panel data covering four South-Asian countries (India, Pakistan, Nepal and Bhutan) including Bangladesh for the time period 1990-2010. The study found that the economic growth has significant effect on unemployment and there is a negative relationship between economic growth and unemployment.

In a similar study conducted in Belgium, it was estimated that, in terms of deviation from their respective trends, a 1 % rise in GDP brings a 0.5 % increase in employment. (Burggraeve et al., 2015).

Another study's findings from Turkey showed that the relationship between growth and employment varied within the industries and supported the jobless growth phenomenon. The results showed the economic growth in Turkey only creates employment in the manufacturing, and the tourism and commerce industries. Also the findings point out that employment increase creates economic growth rather than economic growth creates employment. (Aksoy, 2013).

A research results in Vietnam also showed that there really exists a relationship between employment and economic growth. The results also revealed that the employment elasticity of economic growth are -0.49; 0.55 and 0.66 for agriculture, manufacturing and service sectors respectively and 1.71 for Vietnamese economy as a whole in the period. (Mạnh et al., 2014)

Apart from foreign literatures, the study in Nepalese economic perspective reveals the similar findings to the study. To mention, few of them are:

Acharya (2014) cited that there exists a positive relationship between economic growth rate and creation of employment

opportunities. As economic growth increases, employment also increases.

After empirical study in Nepalese perspective, Khanal (2015) states : in parallel, with a decelerated average growth rate in sectors such as manufacturing, trade, restaurants and hotel perceived as high employment generating sectors, employment elasticity has reduced to 0.18 (2001-2011) from 0.60 (1991-2001). The decomposition analysis also shows that during 1991-2001, changes in both, employment and labor productivity played a key role in the growth process. During 2001-2011, however, declining employment contributed to an increase in labor productivity and thereby growth to some extent. Quantitative analysis examining each sector’s contribution to the level of employment growth and rate changes further reveals that during 1991-2001 the rate of change in employment growth was higher (4.5 percent) as against growth in levels (2.7 per cent). However, during 2001-2011, the employment rate change declined by 10.5 percentage points as against growth in employment levels by 0.6 per cent. The results thus show that with employment becoming precarious in recent years, people have been compelled to seek foreign employment.

III. RESEARCH METHODOLOGY

This study aims to study the effect of economic growth on unemployment rate in Nepal post 1960. This study is based on exploratory research design. Data for the study has been collected from secondary sources such as: different National and International survey reports, Census reports, previous articles, news, etc. For the purpose of the study, the data on economic growth and unemployment rate has been considered. Okun’s Law is tested to check the effect of unemployment on economic growth. Correlation and Regression techniques are applied for studying relationship between unemployment and economic growth. SPSS v20 was used for the analysis of the data.

The following model is considered for the study:

$$\text{unemp rate} = \beta_0 + \beta_1 \text{ecogwth} + \varepsilon$$

where,

unemp rate is the dependent variable and ecogwth is the independent variable. Here, unemp rate indicates the annual unemployment rate and ecogwth indicates the annual Gross Domestic Product at constant price. Likewise, β_0 is the y-intercept; β_1 the slope and ε is the error term.

As per Okun’s Law, following hypothesis is proposed for the study:

H1: There exists negative relationship between unemployment rate and economic growth.

IV. RESULTS

Table I: Descriptive Statistics

	N	Minimum	Maximum
GDP	59	103878795300.00	881798253100.00
UER	28	1.25300	1.88699
	N	Mean	Std. Deviation
GDP	59	330058579747.45	220461847404.88
UER	28	1.60917	.18374

GDP: Gross Domestic Product, UER: Unemployment Rate

The above table-I illustrates the descriptive characteristics of the data. The minimum value of GDP is 103878795300.00 while the maximum is 881798253100.00. Similarly, the minimum rate of unemployment is 1.25300 and the maximum is 1.88699. The mean GDP, indicator of economic growth is 330058579747.45 and standard deviation is 220461847404.88. Likewise, the average Unemployment rate is 1.60917 with standard deviation of 0.18374.

Table II: Test of Correlation between GDP and UER

		GDP	UER
GDP	Pearson Correlation	1	-.697**
	Sig. (2-tailed)		.000
	N	59	28
UER	Pearson Correlation	-.697**	1
	Sig. (2-tailed)	.000	
	N	28	28

** . Correlation is significant at the 0.01 level (2-tailed).

Table-2 shows the correlation between dependent variable, GDP and independent variable, UER. It shows that there exists a negative correlation (-0.697) between GDP and UER at 1% level of significance. This implies that increment in value of GDP results in decrement in unemployment rate and vice-versa. Thus, it proves the alternative hypothesis is valid.

Regression analysis was performed with GDP as an independent variable and unemployment rate as a dependent variable to test the degree of impact of economic growth on unemployment rate. Based on the findings of regression analysis, as shown in Table 3.3, R-square is 0.486. This means the model is capable of explaining about 48.6% of the variability of Unemployment Rate. This result is

complimented by adjusted R square value of 0.466 i.e. 46.6% which is in essence the proportion of total variance that is explained by the model.

Table III: Regression Analysis

Model Summary						
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate		
1	.697 ^a	.486	.466	.1342854410692 10		
a. Predictors: (Constant), GDP						
Coefficients ^a						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	1.990	.081		24.590	.000
	GDP	-7.646E-013	.000	-.697	-4.955	.000
a. Dependent Variable: Unemployment rate						

Here, p-value of Gross Domestic Product coefficient is 0.000 which is less than 0.01. So, hypothesis is accepted at 1 percent level of significance. This indicates that the economic growth has a negative significant impact on Unemployment rate of Nepal.

V. CONCLUSION

This paper has examined the relationship between economic growth and unemployment rate in Nepal through use of correlation and regression analysis. The empirical analysis shows that economic growth has a negative impact of on unemployment rate. The finding is in line with the Okun’s law too. An implication of the finding is that in order to bring down the problem of unemployment in an economy, the focus should be on boosting the economic growth.

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9212>

Abstract- Pedestrian detection has so far worked efficiently using four basic important components namely: feature extraction, deformation handling, occlusion handling, and individual or sequential classification proposed in existing methods. This paper has primarily concentrated on collective basic deep learning on each of these factors using and advancing a new deep neural network architecture. In the aforementioned paper, the advanced neural architecture is compared with the current models including the Caltech benchmark dataset and ETH dataset to examine the results and accuracy.

Index Terms- Articulation, Occlusion, Convolution.

I. INTRODUCTION

- **O**ne most decisive concern in automotive defense, robotics, and intelligent video surveillance is Pedestrian detection. The basic problem is caused by immense variants of pedestrians in clothing, lighting and background articulation and reflection, along with day-night deviation.
- For solving related ordeal difficulties a range of interrelated components is required.
- First feature - Capturing immense discriminative data relating to pedestrians. Haar-like features consisting of SIFT and HOG are contemplated with robust nature for intra-class variation and remain sensitive to inter-class variation.
- Second feature - Articulation of human parts like torso, head, and legs needed to be handled by deformation models. A highly efficient state-of-the-art distorted part-based model is articulated with constraint.
- Third feature - Occlusion handling approaches led to determine the existence of a pedestrian in a window and in the end, the classifier decides whether the pedestrian is a window.

RELATED WORK

Deep models have been shown to be more potential and to achieve dramatic progress in pedestrian detection of computer vision than shallow models. This focuses on learning features, learning contextual data, and managing occlusion.

The primary characteristics used to detect pedestrians are

- HOG
- Hair-like characteristics
- Dense SIFT

To begin with, arranging color highlight as:

First-order color characteristics such as **-color histograms**

Second-order color features such as **as-CSS (color-self-similarity)**

Third-order characteristics such as **co-occurrence attributes**

Texture characteristics such as **-LBP**

Other characteristics such as **as-variance descriptor, depth, segmentation outcomes, 3D geometry, and combinations.**

The capacity to manage deformation increases detection efficiency as pedestrians have non-rigid deformation. For managing the translational motion of components, deformable part-based models are used. The size shift and rotation of components are simulated to manage more complicated articulations and the combination of part appearance and articulation kinds is simulated.

Some of the techniques in which results of blocks or components are taken as input for estimating visibility are suggested for managing occlusion. Many boosting classifiers that **are linear SVM (support vector machine), intersection histogram kernel SVM], multiple kernel SVM, structural SVM, and probabilistic models are used for classification**

methods. All these classifiers are tailored to the training data, but these characteristics are manually built. Optimally, descriptive statistics could be used to guide the learning of features. If the valuable information was lost during extraction of the feature, during classification it cannot be retrieved.

II. METHODOLOGY

Overview of the proposed deep model

In this model:

- From the first convolution layer, filtered information maps are acquired. This layer converts the picture information of the 3-channel input with $9*9*3$ filters and 64 map outputs are used for each filter response(x), i.e. activation function $\tanh(|\tanh(x)|)$ and absolute value rectification. Features maps are acquired by average pooling of 64 filtered data maps using $4*4$ Boxcar filters with $4*4$ sub-sampling steps.
- From the second convolution layer, part detection maps are acquired. This layer converts function maps with 20-part filters of various dimensions and 20-part detection maps outputs.
- Part results are acquired from 20 part tracking maps that used a handling layer of deformation. This layer produces 20 pieces of results.
- The accessibility reasoning of 20-parts is for estimating the label y; i.e. whether or not a specified window contains a Pedestrian.
- Detection windows are taken into height 84 as well as width 28 pictures in which the height of the pedestrians is 60 and with as 20.

There are three channels in the input picture information.

- The first channel is the $84*28$ Y-channel picture after converting the picture to the YUV color space.
- In the YUV color space, the 3-channel $42*14$ images are concatenated into the $84*28$ size channel with zero paddings.
- Four $42*14$ edge maps are linked to the third channel of size $84*28$.
- Three edge maps in the YUV color room are acquired from the 3-channel pictures. Using the Sobel edge detector, the magnitudes of horizontal and vertical edges are calculated. The fourth edge map is acquired by selecting from the first three edge maps the highest magnitudes.
- Image data is converted to $64*9*9*3$ filters and pooled on average to obtain 64 feature maps. The functionality maps will then be processed through the second convolution layer as well as the deformation layer to acquire 20 part scores. Eventually, the

reasoning model for visibility is used to predict the label y for detection.

III. EXPERIMENTAL RESULTS

On the Caltech dataset and ETH dataset, the suggested framework is assessed. To save computation, a detector that uses HOG+CSS and Linear SVM is used at both training and testing phases to prune applicant detection windows. Approximately 60,000 training samples are used to train the profound model that are not pruned by the detector. The execution time needed by our profound model at the test point is less than 10 percent of the execution time needed by the most sampled HOG+CSS+SVM sensor. Learning frequency with batch size 60 is set in the deep learning model as 0.025.

IV. RESULTS OF CALTECH TEST DATA SET

Because Caltech-Test is the biggest among frequently used datasets, on this dataset we explore various profound model designs.

Design of layers:

By feeding the extracted features straight into a linear classifier, a one-layer CNN (CNN-1layer) is acquired. A two-layer CNN (CNN-2layer) is built by converting the extracted characteristic maps with another convolutionary layer and another pooling layer. The addition of more convolutionary and pooling layers at the top of the CNN two-layer does not enhance output.

Design of the input channel:

Results of the experimental investigation were from input channel impact if the input information has only the first picture of the Y-channel, the average error rate is 47%. The incorporation of the second color image channel with reduced resolution decreases the rate of missing by 5%. Including the third channel of edge maps, a further 3%.

Joint Learning:

This decreases the rate of missing. UDN's first convolutional and pooling layers match the extraction step of the function. Thus, either manually constructed or pre-learned, the output of the two layers can be substituted by any other characteristics.

•LatSvm-V2 with a 63 percent miss rate, designs the HOG function manually and then learns the model of deformation. The reasoning of visibility is not regarded.

- DN-HOG, with a missing rate of 53 percent, fixes the HOG as well as the distortion model and then learns the model of visibility.

- UDN-HOG, with a missing rate of 50 percent, fixes the HOG functionality and then learns the deformation and visibility layers together with UDN. The distinctions between DN-HOG and UDN-HOG are whether models of deformation and visibility are learned together. With an error rate of 47 percent, UDN-HOGCSS fixes the HOG+CSS feature and learns the deformation and visibility layers together with UDN. The additional CSS function decreases the rate of missing compared to UDN-HOG by 3%.

- UDN-CNN Feat, with a missing rate of 44 percent, first understands and fixes the function extraction layers using the CNN-1 layer, and afterward explores the distortion and visibility together. In this situation, the deformation and visibility of the function extraction is not jointly taught. By using the characteristics learned from CNN-1layer, UDN-CNN Feat decreases the miss rate by 3 percent compared to UDN-HOGCSS.

- UDN-Def Layer, with a speed of 41%, learns characteristics and deformation together. The theory of visibility is not used.

- UDN learns characteristics, deformation and visibility together. Its level of missing is 5% smaller than the feat of UDN-CNN. The connection among deformation, visibility and learning of features therefore obviously enhances the mode's detection capability.

V. RESULTS OF ETH DATA SET

We adopt the training set frequently taken by state-of-the-art methods (including the highest performing methods on ETH) to use the INRIA training dataset to train UDN for a reasonable comparison on the ETH dataset. After the pruning of the HOG+CSS+SVM sensor, there are about 60,000 negative samples and 2,000 beneficial samples from the INRIA Training dataset.

VI. GAPS IN CURRENT SYSTEM

- As the characteristics are combined for better outcomes but the weather and light background are not recognized and are not taken into account.

- The research concentrated primarily on the identification of pedestrians, but not all ages are regarded and also the height of individuals was not primarily concentrated on.

- Applications where pedestrian detection is primarily used, such as accident-prone circumstances and other traffic control

measures, but this study article did not focus on the condition of cars and the technique of pedestrian detection of such cars.

VII. CONCLUSION

This article proposes a unified profound model that learns four elements for pedestrian detection together – extraction of features, handling deformation, handling of occasions and classification.

- Joint learning achieves the greatest performance on publicly accessible datasets by interacting with these interdependent parts, outperforming current best-performing methods by 9% on the biggest Caltech dataset.

- Detailed experimentation studies obviously demonstrate that the suggested fresh model can improve the power of each part when all components work together. By incorporating the deformation layer, which has excellent flexibility to integrate different approaches to managing deformation, we enrich the profound model. We expect even greater enhancement in the future job by training our UDN on much bigger training sets.

ABSTRACT

This study aims to produce science learning device products such as Syllabus, Learning Implementation Plans (RPP), Student Worksheets (LKS), Student Teaching Materials, and Valid, practical and effective Test Sheets structured inquiry models with Brainstorming strategies to improve thinking skills creative elementary school students. This research was carried out using a 4-D model, namely the stages of defining, designing, developing, disseminating and testing in the fourth grade of Nginden Jangkungan Elementary School 1/247 2018/2019 academic year with One -Group Pretest-Posttest Design. The data analysis technique uses quantitative and qualitative descriptive analysis techniques. The results showed: 1) valid, according to the assessment of the three validators with valid categories, 2) practical, according to the assessment of the two observers seen from the activity of students increasing at each meeting and the implementation of RPP, 3) effective, seen from the significant differences between the results of the pretest and posttest tests of students' creative thinking and positive responses of students. Based on the results of data analysis, it can be concluded that the development of inquiry learning model tools is structured with valid, practical, and effective brainstorming strategies to improve the creative thinking skills of elementary school students.

Keywords: Development of Learning Devices, Structured Inquiry, Brainstorming Strategies, Creative Thinking.

I. Introduction

Everyone is required to have the ability and skills to operate technology, the ability to collect and process information, the ability to cooperate, the ability to innovate, and the ability to have a career in this global era. In this regard, the world of education is required to be able to make various adjustments and changes. Efforts that can be done are with 4C, namely: (1) *Critical Thinking and Problem Solving*; learning based on a problem so that students are able to think of an original solution to the problem. (2) *Creativity and innovation*, learning that must condition students to create innovation and develop their creativity. (3) *Communication*, learning that adheres to constructivism theory. (4) *Collaboration*, the learning process carried out in groups so as to be able to provide and receive advice from other people (Ministry of National Education, 2006).

4C efforts carried out by the Ministry of National Education need to be trained and applied to elementary school students. Some of these abilities must be trained and possessed by every student with the aim that students have strong competitiveness in the global world and survive between competition in all the increasingly stringent fields. Among these efforts there is a creative attitude that is basically owned by everyone, but not everyone is able to develop these abilities. Creative thinking is a thinking skill that creates a new idea. This is supported by Sudarma's statement (2013) which states that creative thinking is an ability that gives birth to a product in the form of creativity and a new creative idea or idea about something. Creative thinking means looking at things from different aspects and different points of view that are different. The ability to think creatively has a big influence on learning. Research conducted in Jakarta by

Supardi (2014) shows that creative thinking has a positive influence on student learning achievement. creative thinking is also listed in Law No. 20 of 2003 which has the aim of developing the position of students to become human believers who fear God, have noble character, knowledge, health, skillful, creative, and independent.

Based on the results of observations and interviews in schools about science subjects, students have not been able to connect between the material explained in school with daily life, students are less active in learning, difficulty developing the ability to think creatively in teaching and learning, and still fixated on the material delivered by the teacher. Some teachers revealed that they were not used to using innovative learning models that could actually create a more interactive and enjoyable learning environment. This is in accordance with the opinion of Puspita (2010) that one of the problems that occur in education in Indonesia is the weak learning process. Tukan (2010) states that the weakness of the learning process in our country is because it emphasizes more on silent student vocal teachers which means that during learning students are not encouraged to develop their thinking skills and rely more on material memorization.

The results of the interview imply that the implementation of learning in the classroom, especially science subjects, still often uses conventional methods such as lectures and discussions even though many science materials require experiments. The method used by the teacher makes students less active so students have difficulty concluding the concept of learning, students only listen to the explanation from the teacher. The right learning model in science learning is a learning model that is characterized by discovery learning, requires techniques or tools that can stimulate students to be involved in learning. this is consistent with Carin (2009) 's opinion that learning activities should be related to ways to find out about nature systematically, so that science is not only mastery of a collection of knowledge in the form of facts, concepts, or principles but also involves the process of discovery. Learning through discovery allows students to gain knowledge and skills through experience so that it helps students understand and master concepts. Things that are found by students during learning are expected to help students to achieve the expected understanding of the concept.

Fun, creative and innovative learning can encourage and motivate students to master the learning material, therefore the teacher must choose the right learning methods and strategies so that the teacher can deliver learning material effectively and in accordance with the student environment. The learning model that fits the needs of students above is a structured inquiry learning model. The teacher's role in the structured inquiry learning model is to select topics, questions and provide material and work procedures. In the learning process students are required to analyze the results and draw conclusions from scientific activities that have been carried out (Ismunandar, 2013).

Teachers as role models for students in schools must master and be able to apply varied learning models and are able to increase the active role of student learning in learning. This is in accordance with the research from Handriani et al. (2015) which uses one model that provides opportunities for students to interact actively, namely applying a structured Inquiry model. In applying structured inquiry methods, students are required to discuss in groups, interact together, make observations, and experiment with teacher guidance. In making observations students work to find answers to these problems. Through the application of structured inquiry methods students can construct understanding and the interrelationship between the material they learn and the real world they face. Thus students will more quickly and easily receive subject matter so that they will get better learning outcomes.

The application of appropriate teaching methods will have a positive impact on learning activities. In addition to the structured Inquiry model, there are studies from Romadhoni et al (2014) that use brainstorming strategies. The brainstorming method allows students to be more productive and create a fun learning atmosphere. Student productivity through the development of problems solved or creative expressions of opinion allows students to understand the material in depth and subsequently shown by good learning achievement. With the conditions for each idea put forward, each member should not be criticized beforehand, making the brainstorming method expected to be able to create a more pleasant learning atmosphere, so as to increase students' interest in learning.

Based on the problems that have been presented, the researcher offers a learning model that can involve active students in the learning process and can train students' creative thinking skills, so it is expected that in the end it can improve science learning outcomes, using structured inquiry models with Brainstorming strategies. The structured inquiry model is an inquiry activity where questions and procedures are still determined by the teacher, but students produce an explanation supported by the evidence that has been collected. This method is used because according to the cognitive development of students who are in the concrete operational stage (Piaget's theory) where fourth grade students are at the age of 7-12 years. The structured inquiry learning model equipped with brainstorming or brainstorming strategies is expected to improve and enhance students' creative thinking skills. Students can think creatively in solving problems in inquiry so that learning is more meaningful. After that students can express their creative ideas from each group through a brainstorming strategy. Research conducted by Handriani et al. (2015) on structured inquiry

and Romadhoni et al. (2014) on brainstorming explained that the model and strategy were appropriate to be used to improve students' creative thinking skills that had an impact on their learning outcomes. The difference in this study with previous research is that researchers combine structured inquiry models using brainstorming strategies because inquiry or discovery models that require students to be active are more perfect if accompanied by brainstorming strategies that make students work together with friends and discuss, and dare to make a deal when collect various kinds of ideas.

This study aims to have a decent learning device with a structured inquiry model with a brainstorming strategy that improves the ability to think creatively in elementary school students. The benefits of this study are the availability of structured inquiry learning models with brainstorming strategies for schools, teachers, and students who can help improve the creative thinking skills of grade IV elementary school students on the material nature of light and optical devices.

II. Method

This research is a development research that aims to develop products. The development model used is a 4D model consisting of *define, design, develop, and disseminate* and tested in the fourth grade of Nginden Jangkungan Elementary School 1/247 2018/2019 academic year with *One-Group Pretest-Posttest Design*.

Data collection techniques used to measure the validity, practicality, and effectiveness of learning devices developed with structured inquiry models with brainstorming strategies in the form of syllabus, lesson plans, teaching materials, worksheets, observation sheets, questionnaires, and tests. While the analysis of the validity of structured inquiry model learning devices with brainstorming strategies is done by converting the average validation results according to suggestions and criticisms from the validator. Furthermore, it was tested to 30 elementary school students in fourth grade of Nginden Jangkungan Elementary School 1/247 to find out the feasibility and content of the learning device products that will be given to students. The analysis of the practicality of learning devices is obtained from the results of the average implementation of RPP and student activities, which are subsequently converted into predetermined criteria. While the effectiveness of structured inquiry learning model tools with brainstorming strategies can be measured based on the results of students' creative thinking tests and student responses to learning.

III. Result and Discussion

The results of the development of structured inquiry learning model tools with light material brainstorming strategies and their nature to improve the creative thinking skills of elementary school students can be said to be feasible including valid, practical and effective. The following are the results of the validation of syllabus, lesson plans, teaching materials, worksheets, and tests of creative thinking skills obtained from the three validators, including:

A. Learning Tool Validation

1. The developed syllabus is assessed by three validators as can be seen in the graph below.

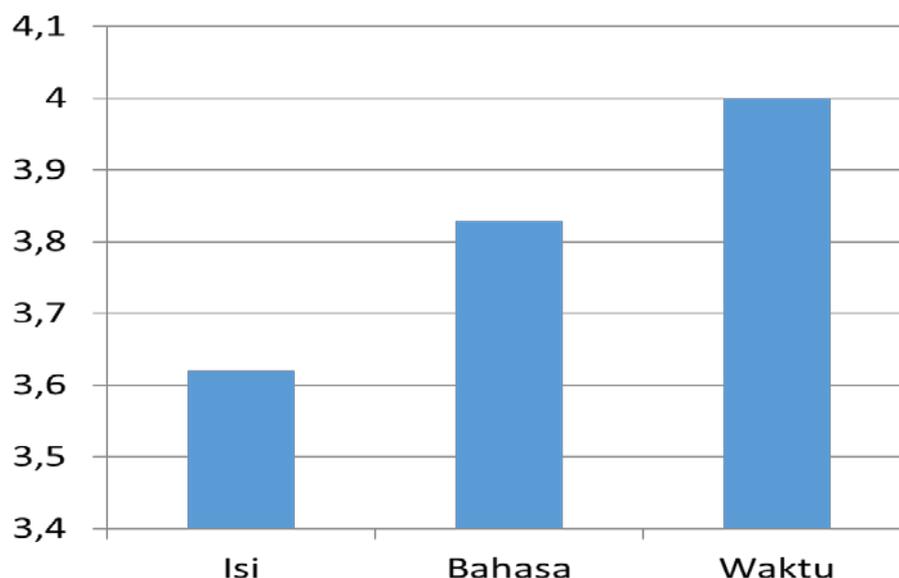

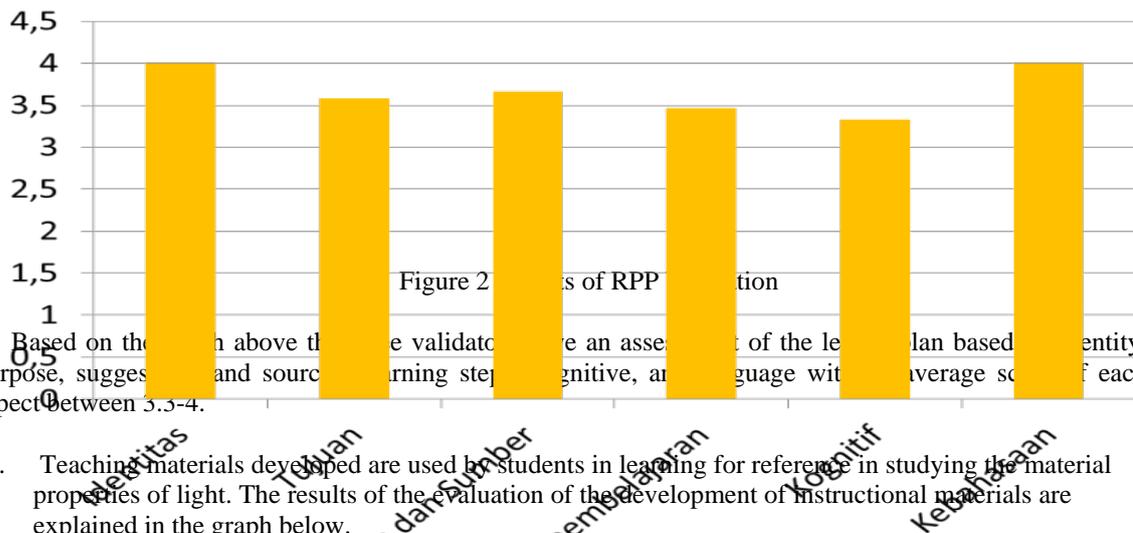

Figure 1 Results of Validation of Syllabus

Based on the graph above the three validators gave an assessment of the syllabus based on content, language and time with an average score of each aspect between 3.62-4.

- The RPP developed was validated by three expert validators to get advice before the RPP was tested. Validation results can be seen in the graph below.

Based on the graph above the three validators gave an assessment of the lesson plan based on content, purpose, suggestions and sources, learning steps, cognitive, and language with an average score of each aspect between 3.3-4.

- Teaching materials developed are used by students in learning for reference in studying the material properties of light. The results of the evaluation of the development of instructional materials are explained in the graph below.

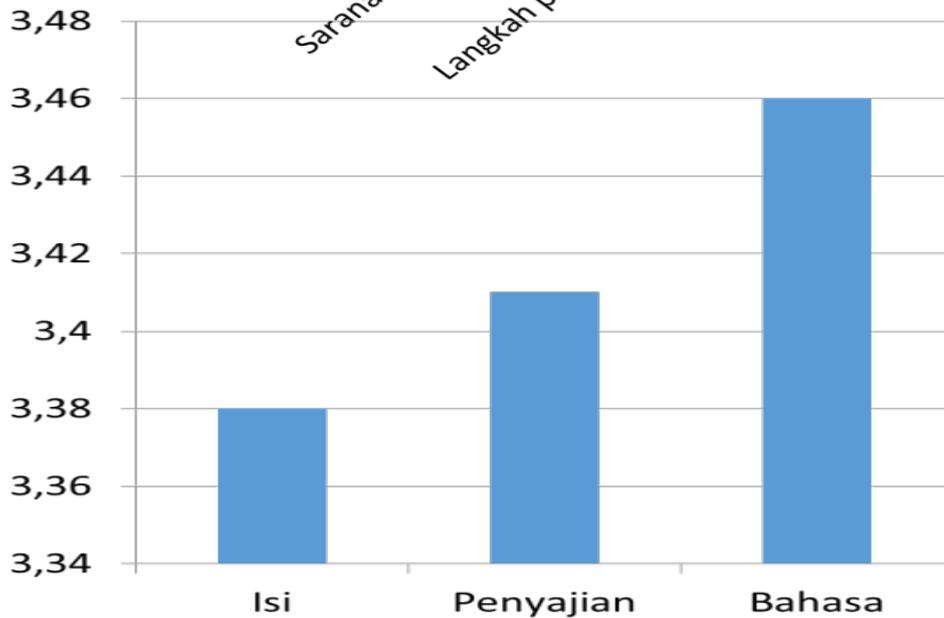

Figure 3 Results of Validation of Teaching Materials

Based on the above graph the three validators gave an assessment of the Teaching Materials based on content, presentation, and language with an average score of each aspect between 3.38-3.46.

- LKS validation is carried out by experts who are competent in light material. The results of the LKS validation can be seen in the graph below.

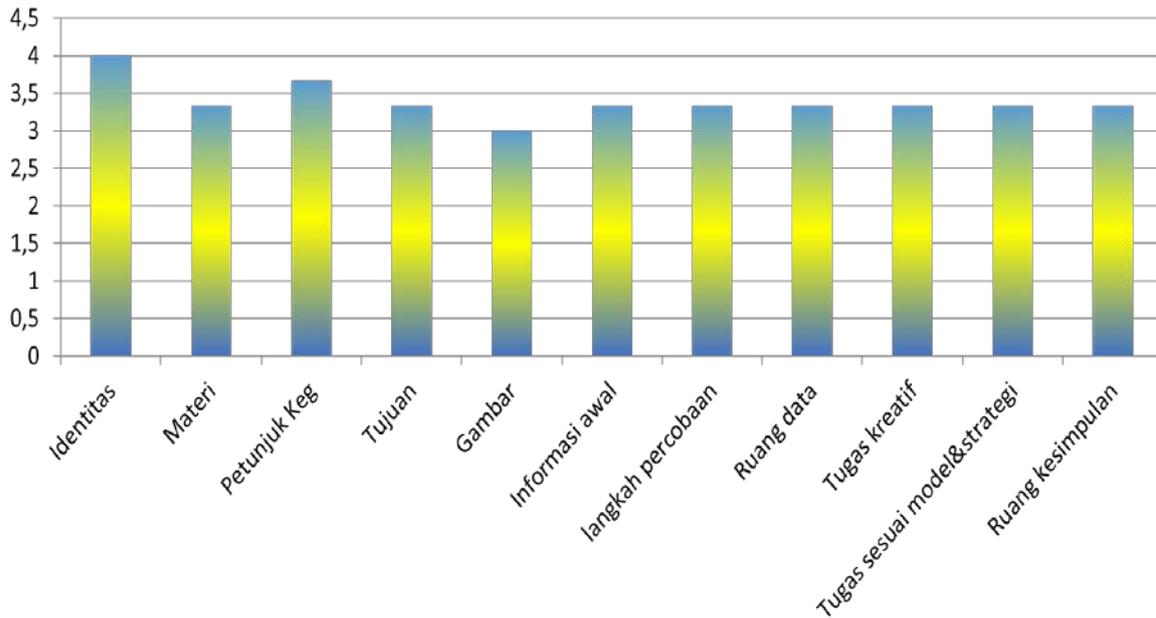

Figure 4 Results of Student Worksheet Validation

Based on the above graph, the three validators gave an assessment of the worksheet based on identity, material, activity indicators, objectives, images, initial information, experimental steps, observation data space, creative assignments, appropriate models and strategies, and conclusion writing spaces with average scores. average for every aspect between 3-4.

- The creative thinking ability test sheet is validated by 3 validators. The validator provides opinions or suggestions on the description test which includes creative thinking criteria namely originality, smoothness of fluency, and elaboration. The validation results of each aspect of creative thinking get an average score of 3.33-3.67 like the graph below.

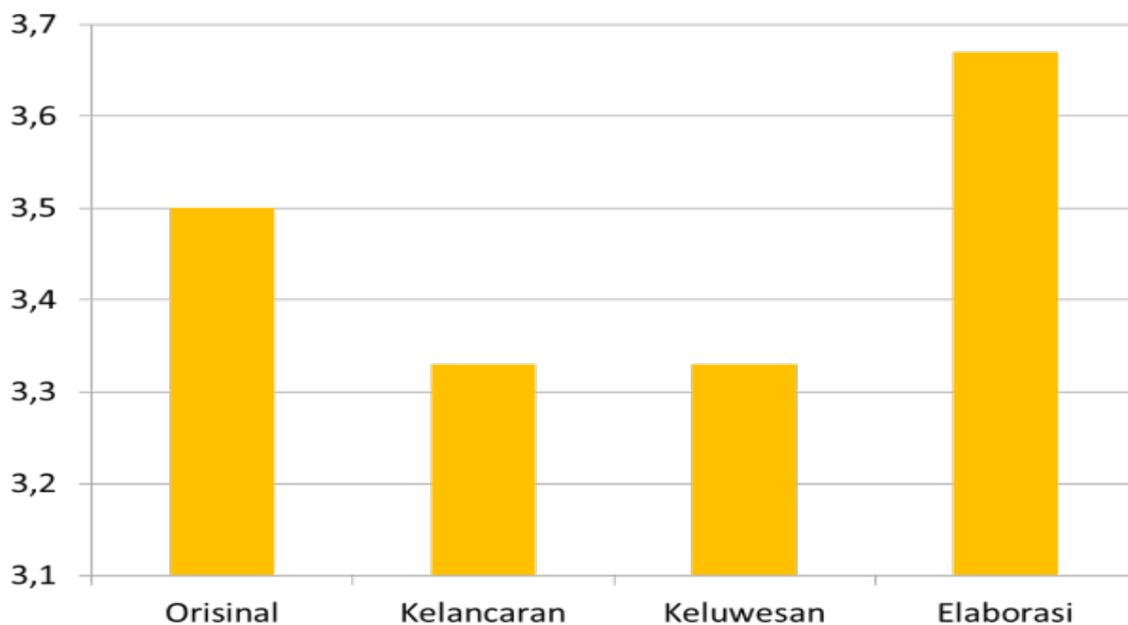

Figure 5 Results of Test Validation

B. Practicality of Learning Devices

Learning tools are said to be practical seen from 2 aspects, namely student activity and implementation of learning. The student's implementation and activities were assessed through a trial given to 30 fourth grade students of Nginden Jangkungan Elementary School 1/247 and observed by two observers.

1. Results of the Implementation of the Learning Plan

The results of the implementation of learning get a percentage of 79% -90%

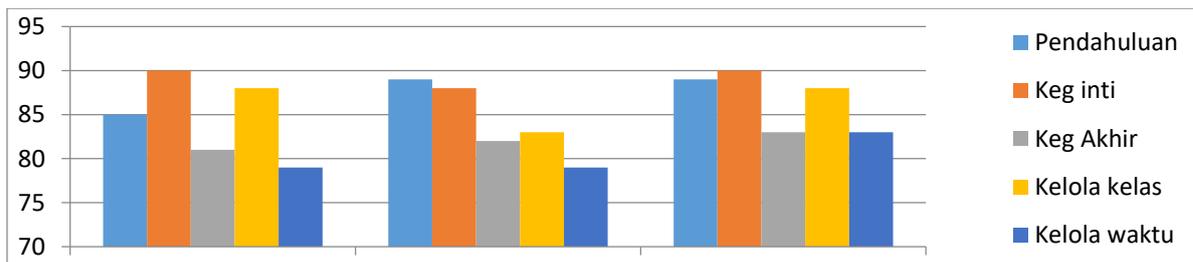

Figure 6 Learning Outcomes Results

2. Results of Observation Analysis of Student Activities

The results of observational analysis of activities that were assessed and observed by two observers during the learning took a percentage between 75% -96%

C. Effectiveness of Material Teaching Learning Materials with a Contextual Approach

1. Student Response

The responses and opinions of students about a learning that has been done is an understanding of student responses. Student responses are presented in the form of questionnaires and given after learning is complete. The results of students' responses to learning using structured inquiry models and brainstorming strategies with percentage details that answered "yes" between 73% -90% while answering "no" between 10% -27%.

2. Test of Creative Thinking Ability

The creative thinking ability test is in the form of a description of 9 questions given to 30 students before being given treatment (pre-test) and after being given treatment (post-test). Data obtained at pretest as many as 28 students were not completed and 2 other students were declared complete with a score above 70. In the posttest activity there was an increase, all students scored above 70.

Based on the results obtained in the pretest-posttest activities that the value obtained by students between the pretest and posttest values increased. Improvement in the test of creative thinking ability can be seen from N-Gain which is in the medium and high category.

Table 1 Student Creative Thinking Ability

No	Thinking Aspects Creative	Pretest Average	Criteria	Posttest Average	Criteria	Completeness		N-Gain	Info
						Pre test	Post test		
1	Originality	49	Less Creative	77	Very Creative	TT	T	0,55	Medium
2	Flexibility	74	Creative	96	Very Creative	T	T	0,85	High
3	Fluency	55	Creative	86	Very Creative	TT	T	0,69	Medium
4	Elaboration	44	Less Creative	79	Very Creative	TT	T	0,63	Medium

Based on the table above, the results of tests of students' creative thinking abilities are at the average N-Gain score of 0.55-0.85 with the moderate category on the three creative aspects and the high category on the aspect of flexibility

IV. Discussion

The validity of the learning device developed was seen from the analysis and assessment of three validators. Validator analyzes, provides suggestions / input for improvement and assessment on each learning device developed. A device is said to be used if the device meets criteria that are feasible, practical, and effective (Nieven, 1999). In addition, according to BSNP (2006), a device is deemed feasible and valid in accordance with the criteria, meaning that the device is arranged in a complete and systematic manner so that learning becomes fun, inspiring, interactive, and motivates students to be active in learning. The validation results of the learning device developed in detail are explained as follows.

Learning Implementation Plans that have been developed as a guide for teachers in providing learning using structured inquiry models with brainstorming strategies to improve students' creative thinking skills in accordance with the opinion of Sugiyono (2006) that is learning through logical, objective, logical, and rational observation and recording processes in learning and interaction activities to achieve a goal. RPP is assessed or validated by three validators. The results of the assessment of the RPP described in table 4.1 consist of three discussions, namely the presentation of content, language, and time allocation with a total of 11 statements that scored between 3.33-4. After the discussion process, improvements were made to the lesson plan according to the validator's suggestions. Some of the improvements made in the RPP are replacing the formulation of indicators, namely the triggering word into a more operational word so that it is easy to measure or evaluate student activities by replacing them with decisive words. Another improvement is about the stages of structured inquiry model activities that have not been too visible in learning. the stages of structured inquiry model activities are also adapted to several aspects of creative thinking which include the ability to find new ideas known as fluency in thinking, being flexible in developing an idea or flexibility, having a fast and responsive response to certain situations or original, and thinking in detail or elaboration to make it more visible in learning.

The results of the validation of Student Teaching Materials (BAS) developed, are presented in table 4.2 with three discussions, namely about content, presentation, and language getting scores between 3.33-3.67 with a total of 19 statements included in the valid category according to the adapted assessment from Ratumanan and Laurens (2015) which showed that the score was included in the valid category with a slight revision. The three validators gave approval that the teaching materials developed could be used in the study with several revisions. Some of the improvements or revisions suggested by the validator are the fonts used should be replaced so that they are more clearly read by elementary school students, it is recommended to present the images in each experimental step both experiments about the nature of light and about making optical devices, and need diagram or explanation of human processes seeing an object around it. According to Nieven (1999) in developing material in a teaching material must be adjusted to the level of knowledge of students.

Other learning tools that are validated after RPP and teaching materials are Student Worksheets (LKS). LKS developed based on a structured inquiry model with a brainstorming strategy was measured by three expert validators presented in table 4.3 getting valid results with scores between 3-4 with a total of 11 statements. LKS given to students consists of four LKS. LKS 1 contains the experimental activities of light properties propagating straight and penetrating clear objects that stimulate students to think creatively solve problems that occur related to events in everyday life about light that propagates straight, students also must determine objects that can be penetrated by light an observation table. The next LKS, which is LKS 2, contains experiments on the nature of light that can be reflected and decomposed. In this learning activity students are given several mirrors which are included in a flat, concave and convex mirror. Students are stimulated to express their creative ideas when distinguishing the results of shadows on the three mirrors. The activity carried out by the students is to prove that light can be described by making bubbles from the liquid soap that is seen with the sun's heat. LKS 3 contains student activities about the last nature of light, namely light can be refracted. Problems in daily life about refraction of light are presented in the LKS and make students with the group discuss seeking solutions to problems. The last LKS is a four LKS about making a simple optical instrument (kaleidoscope). The selection of kaleidoscope as an optical instrument that will be made by students with the group is because this is a new thing for students. Previously students were only taught how to make a color spectrum and use a periscope on light material explanations. The kaleidoscope that is made combining the properties of light can be reflected.

Suggestions given by the validator on LKS one to four are at each stage of the steps in the LKS should be given a picture so that students are more interested and can understand clearly when conducting experiments with their groups. LKS used contains experiments that must be done by students and groups that can improve their creative thinking skills. In this learning activity students are expected to be active in each activity. Students also have to build collaboration with groups and express creative ideas that will later be agreed upon in filling out the questions contained in the LKS. The activity in learning science lies in two aspects, namely the aspect of acting and active thinking. Science learning in schools is centered on students and emphasizes the importance of active learning which will change the opinion that teachers always provide information and become a source of knowledge for students (NRC, 1996).

The results of the assessment of the syllabus are presented in table 4.4 which is considered valid with a score between 3.33-4 by three validators. The syllabus is given a very good rating because it gets 4 more scores than the score 3. Score 4 is obtained because researchers have linked KI and KD in the subjects, the activities presented in the syllabus already contain the outline of student activities, time allocation has been adjusted to the material, the use of language is easy to understand and in accordance with EYD. The validated syllabus can be directly used in research without revision. The syllabus prepared is also in

accordance with Permendikbud No. 54 of 2013 concerning Competency Standards for Primary and Secondary Education Graduates.

The next component of the learning device after the RPP syllabus, LKS and teaching materials is a test of creative thinking skills described in table 4.5. The test sheet was developed to find out the students' creative thinking skills after the inquiry model was structured with a brainstorming strategy. This test is given before and after teaching and learning activities. The creative thinking ability test sheet is used to determine the ability of students to think original, smooth, flexible, and detailed. In addition, tests are also arranged to provide training and motivate students to find knowledge by themselves. This is supported by the opinion of Schunk (2012) which explains that students need to be trained, get feedback, obtain tinjauan and explanations, and get motivations that affect learning. Assessment was carried out in the form of pretest and posttest.

Tests given to students are in the form of descriptions. Each question contains aspects of creative thinking. The test of creative thinking ability uses a description of the questions that students can answer freely and broadly according to their imagination and opinions. In some questions requires student answers more than one answer so students can write various creative ideas about solutions to problems that are in the question. Assessment of the answers to each question ranges from 1-4 according to the existing assessment criteria and is given a score of 0 if the student does not provide an answer to the question. The creative thinking aspects of originality, fluency, and flexibility consist of each of the 2 questions, while the elaboration aspects have 3 questions with the total test questions being 9 questions.

The results of the validation assessment of the creative thinking ability test by three validators are presented in table 4.5 by getting a score between 3.33-3.67 which is included in the valid category and can be used without revision. The validator only gives suggestions on the presentation of the images contained in the test questions. It should be clearer by enlarging the size. Creative thinking tests are arranged according to the environment around students that are often found and found so students are not familiar and can apply new knowledge gained in everyday life. Problem solving or learning like this requires conceptual understanding so students can do what they have learned in real life (Anderson and David, 2001).

Based on the description above, the results of the assessment of RPP, BAS, LKS, syllabus and creative thinking ability tests are valid, so that they can be used in research with several improvements and improvements to the selection of letters that fit elementary school students, choosing the appropriate operational verbs on the indicator so that it is easy to take measurements or assessments, present images and diagrams in the process of seeing an object, present images at each step of the experiment, show steps for activities that use a structured inquiry model with brainstorming strategies for each learning activity, and time management that must be correct really noticed because all activities contain experiments.

The next discussion about learning devices after validity is practicality. The practicality of structured inquiry learning models with brainstorming models was analyzed through the implementation of RPP and student activities during learning. The results of the analysis of the implementation of RPP meetings 1, 2, and 3 obtained a well implemented category and were very well presented in tables 4.6 to 4.8 with a percentage of 75% -100% in each activity. The activities observed consisted of 5 research focuses, namely preliminary activities, core activities, final activities, classroom management, and time management. During the learning process, researchers are observed by two observers. Observers have the duty to observe carefully whether the learning activities carried out by the researcher are appropriate or not in accordance with the lesson plan. This is in accordance with the opinion of Sugiyono (2016) a process of observation and recording that is systematic, logical, objective, and rational regarding various activities in the form of thoughts and in interactions to achieve certain goals. Observers try to observe whether there are learning activities that appear and do not appear, or learning activities that are only discussed quickly and not too detailed by the researcher. The results of observations that have been made indicate that learning activities are appropriate, all activities have arisen, researchers are coherent in teaching, and can manage the class well. This is in accordance with a study by Sari et al (2015) on the Implementation of Guided Inquiry Combined with Brainstorming Activities to Improve Integrated Science Process Skills in Biology Learning in eleventh grade students of MIA 2 Karanganyar Senior High School 1. This research proves that by applying the inquiry model and brainstorming helps students understand science concepts or material by the way they directly find out their knowledge by conducting experimental activities in groups that work together to solve a problem by discussing and mutually agreeing.

Activities carried out by observers in addition to observing the activities of the teacher or researcher are observing student activities. Student activities observed include student attitudes that arise when learning takes place. Observers give an assessment of the activities of students who actually observe the teacher when giving explanations, students who actively ask or answer the questions of the teacher, students who are not active during learning, students who immediately complete the task given, students who can work with groups, and students who want to come up with creative ideas during learning. the results of assessment of student activity by two observers are presented in tables 4.9 to 4.11. in the table data obtained is high and

very high student activity in receiving learning with a percentage of 75% -96% in each activity in accordance with the criteria delivered by Riduwan (2010). They carry out learning activities according to the focus of research that supports them to be active, work together and play a creative role in solving problems in daily life related to the subject matter of light.

A good learning tool is seen in terms of validity, practicality, and effectiveness. The effectiveness of learning devices can be analyzed from the results of student responses and the results of tests of creative thinking skills. Questionnaire for student responses is given at the end of the lesson, namely at the third meeting of each class. Questionnaire for student responses was filled by 30 students who were the subjects of the study. The results of student responses are presented in table 4.12 with details of the percentage that answered "yes" between 73% -90% while answering "no" between 10% -27% in statements relating to the implementation of learning. In accordance with Riduwan's assessment criteria (2010) the results of student responses belong to the strong and very strong category of learning. They were interested in structured inquiry model learning with brainstorming strategies because the model and strategy jasmine students gave rise to creative ideas in the form of opinions which were grouped together and discussed to be agreed upon. Students also feel that learning with these models and strategies is easy to understand especially given a companion book, which is student teaching materials that have been given interesting colors and images so that students are more interested and motivated to read them. Learning carried out by students with structured inquiry models with brainstorming strategies is very fun to increase student motivation for activities carried out high by marked positive responses given by students. This statement is in line with the opinion expressed by Kurl Kelvin (Sanjaya, 2014) that factors that can encourage individuals to behave because of the motivation that arises because there are benefits of certain attractions.

The effectiveness of a device can also be seen from the results of students' creative thinking tests. The results of the students' creative thinking ability test presented in table 4.13 show students have creative thinking skills with an average gain of 0.44-0.93 which is included in the medium and high categories. there was an increase in the results of the students' creative thinking test at the pretest and posttest. Students who get the complete score are students who get a score of more than 70. At the pretest there are two students who complete from 30 students, while in the post all students get a complete category. The low level of creative thinking ability of students who were asked on the pretest questions because students had not obtained the question information. In addition, students are also not used to solving problems that require themselves to think creatively. Another factor that causes the low level of creative thinking of students at pretest is because students do not have direct learning with them looking for answers from experiences done by students, so that there is a difference of understanding in working on a problem. The test uses a structured inquiry model with a brainstorming strategy that consists of 9 problem questions, each of which contains aspects of creative thinking including, original, flexibility, fluency, and elaboration. N-gain calculation is not only done on students but also on aspects of creative thinking presented in table 4.14. The original aspects, fluency, and elaboration get moderate gain while the flexibility aspect gets high gain. The average score of n-gain aspects of creative thinking is between 0.55-0.85. This is in accordance with research by Kadir et al. (2017) on the Implementation of Open-Inquiry Approaches to Improve Students' Learning Activities, Responses, and Mathematical Creative Thinking Skills combined with research by Romadhoni (2014) on the Effectiveness of Applying Brainstorming Methods to Improvement Interests and Economic Learning Achievements of Grade X Students at YPKK 3 in Sleman. The results of this study indicate that by applying the inquiry model and adding brainstorming strategies to science learning make students improve imagination, creativity, and work together in solving problems.

V. Conclusion

After doing the research, it can be concluded that the structured inquiry learning model with appropriate brainstorming strategies is used in terms of its validity, practicality, and effectiveness as well as improving students' creative thinking skills. The advice that can be given is if you want to improve your ability to think creatively, use a structured inquiry model with brainstorming strategies that have been proven to improve the creative thinking skills of elementary school students. If using a structured inquiry model learning tool with a brainstorming strategy, time preparation and management needs to be considered, because the learning involves experimental activities and requires considerable time. Research needs to be conducted for the wider trial subjects in the use of structured inquiry model learning tools with brainstorming strategies

Abstract-The study was carried out to investigate the effect of phosphate fertilizer application on manganese (Mn) adsorption. Composite sandy loam and loam soil samples (0-20 cm) were collected from Dalori and Gongulong and analysed for their texture and chemical properties. Mn adsorption experiment was carried out. Loamy soil collected at Gongulong was moderately acidic in reaction, moderate in electrical conductivity (EC), high in base saturation, moderate in organic carbon, low in available phosphorus, and low in DTPA extractable Mn. While sandy loam soil collected at Dalori is neutral in reaction, low in EC, high in base saturation, low in organic carbon and low in DTPA extractable Mn. For sandy loam soil, there was no definite trend in the equilibrium Mn concentration with and without phosphate (P) fertilizer treatment, with increasing application of Mn concentrations. There was however no difference in the amount of Mn adsorbed by the soils when P fertilizer was added. For loam soil, there was no definite trend in the equilibrium Mn ion concentration of the soils with increasing application of Mn levels to the soils with and without P fertilizer treatments. There was however an increase in the amount of Mn adsorbed by the soils. There was no difference in the amount of Mn adsorbed by the soils when P fertilizer was applied. Data were fitted into Langmuir and Freundlich equations. Loam soil without P conformed to Langmuir equation, while for Freundlich isotherm, loam soil with P treatment conformed to the equation. The results showed that maximum adsorption (b) for loam soil without P was 0.99mg/g and binding strength (K) of -214.92 ml/ μ g. While for Freundlich, the adsorption constant (K) and (n) were 1.28 and -0.21 respectively. This study have revealed that there is no observable effect on the amount of Mn adsorbed by the soils after P fertilizer was applied and on the other hand do not reduce bioavailability of Mn in soil.

Key words: Manganese, Adsorption, Phosphate, Freundlich, Langmuir.

Introduction

Manganese (Mn) is a naturally occurring element that is found in rock, soil, and water. Manganese (Mn) is present in the soil in greater quantities than other trace elements, with the exception of iron. It is ubiquitous in the environment and comprises about 0.1% of the Earth's crust (Siegel and Siegel, 2000). Manganese is present in soil as a result of mineral weathering and atmospheric deposition, originating from both natural and anthropogenic sources. There are three possible oxidation states of manganese in soil, namely Mn(II), Mn(III) and Mn(IV). The divalent ion is the only form that is stable in soil solution, while Mn(III) and Mn(IV) are only stable in the solid phase of soil (McBride, 1994). The bioavailability of Mn in soils is generally adequate at pH < 6.5 but it becomes significantly lower in soils with higher pH values (Ducic and Polle, 2005).

Manganese is used in plants as a major contributor to various biological systems including photosynthesis, respiration, and nitrogen assimilation. Manganese is also involved in pollen germination, pollen tube growth, root cell elongation and resistance to root pathogens. It also serves as electron storage and delivery to the chlorophyll reaction centers (Diedrick, 2010; Millaleo *et al.*, 2010).

Manganese deficiency symptoms, which often look like those of iron deficiency, appear as interveinal chlorosis on the young leaves, and sometimes tan, sunken spots that appear in the chlorotic areas between the veins. Plant growth may also be reduced and stunted. Manganese deficiency can occur when the pH of the growing medium exceeds 6.5, because it is tied up and unavailable for uptake. Manganese toxicity symptoms begin with the burning of the tips and margins of older leaves or as reddish-brown spots across older leaves. Severe toxicity may result in spots becoming more numerous and larger, forming patches on the older leaves. At pH levels below 5.5, manganese is very soluble and toxicity symptoms are probable (EdBloodnick, 2015).

Adsorption is another potential process controlling bioavailability of manganese in soil. Adsorption is the accumulation of gases, liquids, or solutes on the surface of a solid or liquid. It is the process by which molecules of a substance, such as a gas or a liquid, collect on the surface of another substance, such as a solid. The molecules are attracted to the surface but do not enter the solid's minute

spaces, as in absorption (AHDSS, 2014). Adsorption of Mn has been shown to conform to the Langmuir or Freundlich isotherm (Willett and Bond, 1995). Adsorption increases with increasing pH, due to the increased hydrolysis species of Mn^{2+} that is preferably adsorbed and increased negative charge on the exchange complex (Reddy and Perkins, 1976).

In well aerated soils, phosphates are of major importance in controlling the level of micronutrients in soils and they are a limiting factor in the soils of arid and semi-arid regions of the world. For optimum utilization of manganese by the crops, knowledge of behavioural interaction of phosphate fertilizers and manganese is essential. Information on adsorption characteristics of manganese as affected by phosphate fertilizers in soils are scarce in literature despite its relative importance as essential micro nutrient. Therefore the objective of this study is to determine the effect of application of 100ppm phosphorus on manganese adsorption by some soils in Borno State.

Materials and Methods

Sampling site

The study was carried out with the soils of Borno state with coordinates 11°30'N 13°00'E and about 350m above sea level (Encyclopedia, 2013). with annual mean rainfall and temperature of 650mm and 32°C. The soils of Borno State vary in colour, texture, structure, physico-chemical and other essential characteristics from the hilly south to the northern dune landscape (Nigerian Wiki, 2008). The vegetation is a mixture of Sudan Savannah and Sahel Savannah dominated with Acacia species (Nigerian Wiki, 2008).

Soil Sampling and Handling

Composite sandy loam and loam soil samples (0-20cm) were collected from two different locations namely; Dalori (11.78574°N and 13.27079°E) and Gongulong-Lawanti Agricultural Area (11.89629°N and 13.19534°E). The soils were air dried, ground to pass through 2mm stainless steel sieve and the texture was confirmed in University of Maiduguri Soil Science laboratory and used for routine physico-chemical properties determination and for the adsorption experiment.

Manganese adsorption experiment

2g of soil was weighed into series of plastic bottles. 25mls of double strengthed manganese concentrations (0, 50, 100, 150, and 200 ppm) were added to the bottles. 5mls of 1000 ppm P was added to the appropriate bottles. 20mls of 0.02M $CaCl_2$ was added to the bottles containing P and 25mls to those without P. The final concentrations of manganese were 0, 25, 50, 75 and 100 ppm and the final strength of $CaCl_2$ and P were 0.01M and 100 ppm respectively. The bottles were shaken with WS-2 100A

SERADON platform shaker at 27°C at 400rpm for one hour and equilibrated for 24 hours and Mn concentrations in equilibrium solutions were determined using uv smart spectrophotometer. The amount of adsorbed Mn was calculated by the difference between Mn added and that

remained in the equilibrium solutions multiplied by soil solution ratio. The obtained results of adsorption experiments were tested with Langmuir and Freundlich adsorption equations. Langmuir equation is as follows:

$$X = \frac{kbC}{1+kC}$$

Where C and X are the equilibrium ion concentration and the amount of ion adsorbed and the constants b and k which are related to adsorption maximum and binding strength of the adsorbent. Using the Langmuir isotherm, a graph of C/X against C was plotted where the slope (1/b) and intercept (1/Kb) from which both binding energy (K) and maximum adsorption (b) were found.

Freundlich adsorption equation is as follows:

$$\text{Log } X = \text{Log } K + n \text{ Log } C,$$

Where X is the amount of substance adsorbed per unit weight of adsorbent, C is the equilibrium concentration of the adsorbate, K and n are constants. Using Freundlich isotherm, a graph of Log X versus Log C was plotted giving a straight line from which the slope(n) as adsorption intensity and intercept (Log K) can be used to obtain the adsorption constant (K) by taking the antilog for soils that have conformed to the model.

Results and Discussion

The particle size of the soil sample collected at Gongulong had 47.10% sand, 43.20% silt and 9.70% clay with textural class of loam and soil at Dalori contained 64.60% sand, 28.20% silt and 7.20% clay and with textural class of sandy loam (Table 1).

Table 1: Particle size distribution of the soil samples

Soil sample	Sample Location	%			Textural class
		Sand	Silt	Clay	
1	Dalori	64.60	28.20	7.20	Sandy-loam
2	Gongulong	47.10	43.20	9.70	Loam

Loamy soil collected at Gongulong was moderately acidic in reaction, moderate in electrical conductivity (EC), high in base saturation, moderate in organic carbon, high in calcium, very high in magnesium, moderate in potassium, high in sodium, low in available phosphorus, and low in DTPA extractable Mn. While sandy loam soil collected at Dalori is neutral in reaction, low in EC, high in base saturation, low in organic carbon, low in calcium, high in magnesium, low in potassium, high in sodium, low in available phosphorus, and low in DTPA extractable Mn as in Table 2.

Table 3 shows the results obtained from adsorption studies. There was no adsorption of Manganese (Mn) as to the treatments with 0 level Mn. But amount of Mn adsorbed increase with increase in Mn level from 25µg/ml to 100µg/ml for all the soils with and without phosphorus (P). For example in loamy soil from Gongulong without P when no Mn was applied there was no adsorption but when 100µg/ml level of Mn was applied, the amount of adsorbed

Mn was 2.50mg/g. This shows that as the Mn concentration increases Mn adsorption also increases in the soils.

There was no difference in amount of Mn adsorbed by soils with P and without P for both sandy loam and loam.

Table 2: Chemical properties of the 2 soil samples

		114	100	0.09	-0.10	2.50	-0.04	0.40	1.00		
		2	Loam without P	200	0	0.25	0.00	0.00	0.00	0.00	0.00
				201	25	0.42	0.17	0.62	0.27	-0.21	-0.77
				202	50	0.22	-0.03	1.25	-0.024	0.0969	1.52
				203	75	0.43	0.18	1.87	0.096	0.27	-0.74
204	100			0.32	0.07	2.50	0.028	0.40	-1.15		
Loam With 100ppm P	210		0	0.05	0.00	0.00	0.00	0.00	0.00		
	211		25	0.01	-0.04	0.63	0.063	-0.20	1.40		
	212		50	0.62	0.57	1.24	0.46	0.093	-0.24		
	213		75	0.14	0.09	1.87	0.048	0.27	-1.05		
214	100	0.64	0.59	2.49	0.24	0.40	-0.23				

With regards to the equilibrium concentration, for sandy loam soil without P treatment and loam soil with P treatment, as concentration of Mn increases, the equilibrium concentration increase and then decreased with no observable definite trend. While for sandy loam soil with P treatment, as the Mn level increases, there was increase first and then decrease in equilibrium concentration as shown in figures 1 and 2.

Harter (1991), in a review of the subject, concluded that, adsorption isotherms have provided the majority of information about micronutrient adsorption by soils. For

Langmuir adsorption isotherm, only loam soil without P conformed (Fig. 3) while for Freundlich adsorption isotherm, only loam soil with P treatment conformed (Fig. 4) and these have agreed with the findings of Willett and Bond (1995) who concluded that adsorption of Mn has been shown to conform to the Langmuir or Freundlich isotherm. While sandy loam soil with P treatment and without P have not conformed to either of Langmuir or Freundlich isotherm and this may be due to their difference in adsorption behaviours that can be attributed to physiochemical properties of the adsorbents and the cation anion pairs,

solution pH, surface adsorption coverage as stated by Wang and Xing (2002).

Using the Langmuir and Freundlich equations, adsorption constants for loam soil without P and loam soil with P which conformed to the models were evaluated. The results showed that maximum adsorption capacity (b) for loam soil without P was 0.99mg/g and binding strength (K) of -214.92ml/ μ g. While for Freundlich, the adsorption constant (K) and (n) were 1.28 and -0.21 for loam soil without P. This study have revealed that there is no observable effect on the amount of Mn adsorbed by the soils after phosphate fertilizer was applied and on the other hand do not reduce bioavailability of Mn in the soils as to the findings of Ajouri *et al.*, 2004 who concluded that phosphorus induced micronutrients deficiency is not common to all soils, crop species and environmental conditions, but it has been proved in various soils and crops. Also John (1999) stated that phosphorus/Mn interactions can develop when soil Mn availability increases with higher soil P levels. On some soils this is believed partially due to increased soil acidity from high rates of P.

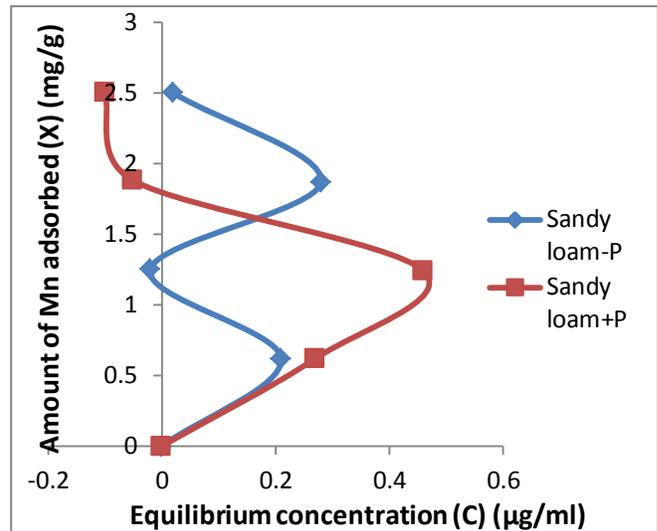

Fig. 2: Adsorption isotherm for sandy loam soil with P and without P

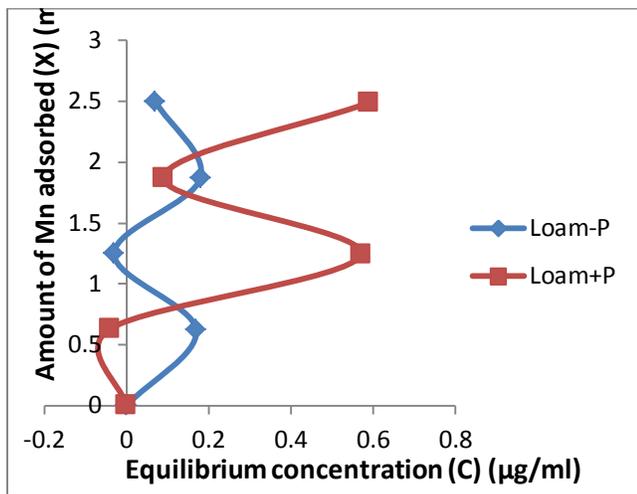

Fig. 1: Adsorption isotherm for loam soil with P and without P

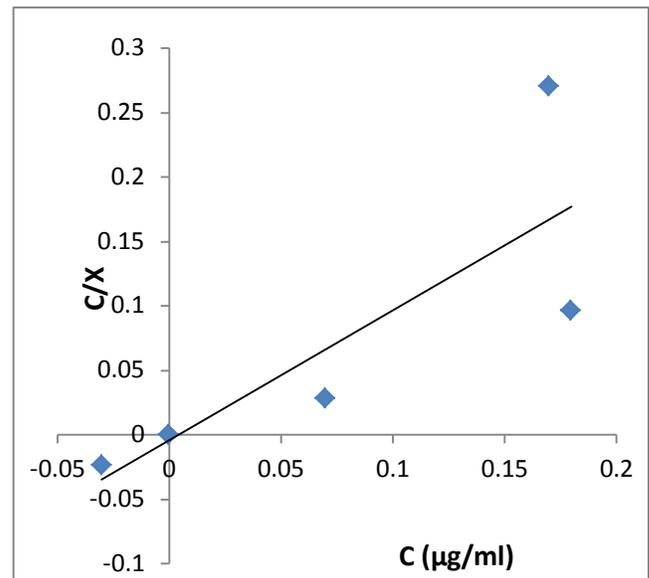

Fig. 3: Langmuir isotherm for loam soil without P

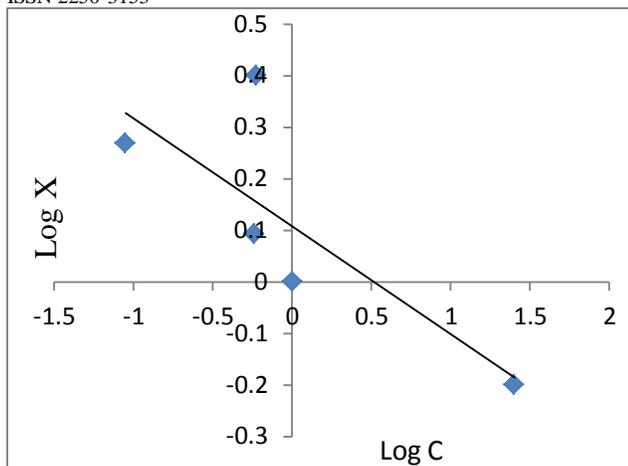

Fig. 4: Freundlich isotherm for loam soil with P

Conclusion

The application of $100 \text{ mg kg}^{-1} \text{ P}$ had no effect on the adsorption of Mn by both loam and sandy loam soils studied.

Abstract- This paper deals with the problems faced by the current designs of aircraft-based emergency homing devices like ELTs (Emergency Locator Beacons) and ULBs (Underwater Locator Beacons). Particularly, it deals with issues like low battery life of the transmitters and remaining in a deactivated state even after a crash. Many alternative methods are proposed which can make the homing beacons more efficient.

Index Terms- Black box, Electronic Locator Transmitter, Search and Rescue, Underwater Locator Beacon

I. INTRODUCTION

There have been 1114 commercial airplane accidents since 2008 [1,2]. When an aircraft crashes, specialized hardware, namely a black box, is responsible for protecting the flight data recorder (FDR) and cockpit voice recorder (CVR), which is used to collect information about flight instruments and pilot's interaction just before the crash. This information is crucial to ascertain the cause of the crash and improve safety in aviation. According to EUROCAE, the black box is made to withstand extremely high pressures of over 3400 g and temperatures of about 1000 deg C [3]. In addition, the black box also has integrated ULB (Underwater Locator Beacon) for SAR (Search and Rescue) operation, which are of acoustic pinger type and have varying amounts of range depending on weather conditions (2-5 km). Also, they usually transmit over the 8.8 or 37.5±1 kHz band and have an underwater transmission depth of 6096m. [4,5,6] Additionally, they have a life of about 30/90 days, after which the signal begins to degrade and the output decreases as a result [6].

To transmit such emergency signals when crash happens in land area, ELT (Emergency Locator Transmitter) is used. The International Civil Aviation Organization (ICAO) defines an ELT as equipment which broadcasts distinctive signals on designated frequencies and, depending on the application, may be automatically activated by impact or be manually activated [b]. ELTs are radio beacons carried on most aircraft so that in the event of an accident in a remote location the aircraft wreckage and its occupants can be located quickly by search and rescue (SAR) operations. Finding the aircraft wreckage quickly not only

increases the chance of survival of the occupants but also reduces the risk to pilots of SAR aircraft who commonly need to operate in marginal weather conditions and over mountainous terrain.

Over the years, there have been various cases of failure of ELT/ULB, two of which are Air France flight AF447 on June 1, 2009. It took 2 years and \$41 million dollars to recover the black boxes, because its location could not be pinpointed due to the low pinging frequency of one in 10 minutes. Another famous incident occurred on March 8, 2014, where Malaysia Airlines flight MH370 veered off course and reportedly crashed somewhere in the ocean. In this case, no pings were heard and the search was stopped after 5 years which was conducted by 26 countries and approximate cost of search operations was \$200 million dollars [7].

For this paper, we will focus on ELTs, as they have a much shorter life as compared to ULBs. However, the core technology used remains the same, and thus all ideas discussed in this paper will also be applicable to ULBs unless stated otherwise.

ELTs are of many different types, based on their application, some of which are-

Automatic fixed ELT (ELT/AF): An automatically activated ELT which is permanently attached to an aircraft.

Automatic portable ELT (ELT/AP): An automatically activated ELT which is rigidly attached to an aircraft but readily removable from the aircraft.

Automatic deployable ELT (ELT/AD): An ELT which is rigidly attached to an aircraft and which is automatically deployed and activated by impact, and, in some cases, also by hydrostatic sensors. Manual deployment capability is also provided.

Survival ELT (ELT/S): An ELT which is removable from an aircraft, stowed so as to facilitate its ready use in an emergency, and manually activated by survivors [8].

II. BACKGROUND AND HISTORY

Before 1970, whenever a plane met with an accident in a remote area, it was very difficult to locate the plane and provide rescue operations to the survivors. Sometimes it took many days to find the location of the accident and quite a few times the plane was

never found. Because of this problem, a need was felt to develop a mechanism so that the plane can be located at the earliest in the event of an accident. For this it was decided to install a radio beacon called ELT (Emergency Locator Transmitter) in the plane such that in the event of an accident this ELT should get activated and should start emitting the radio beacon and by using this beacon the site of the accident can be quickly searched out and rescue operation can be performed at the earliest. The basic purpose of this system is to help rescuers to find survivors within the so-called "golden period" (the first 24 hours following an accident) during which the majority of survivors can usually be saved.

In 1970, the USA mandated to install Emergency Locator Transmitter (ELT) in all general aviation airplanes by December 30, 1973. These ELTs were operating at 121.5 MHz frequency, the designated international distress frequency. These ELTs were manufactured to the specifications of a Federal Aviation Administration (FAA) technical standard order (TSO-91) [9].

ELTs were originally intended for use on the 121.5 MHz frequency to alert air traffic control and other aircraft monitoring the frequency.

In 1982, a satellite-based monitoring system named COSPAS-SARSAT was implemented, to provide a better way to detect these distress signals. This satellite-based monitoring system was monitoring the distress signals at 121.5 MHz, 243 MHz, and 406 MHz radio frequencies. However, such a satellite-based monitoring system was receiving a high number of false signals at 121.5 MHz and 243 MHz frequencies. It was found that such false alert signals were mainly from old ELTs. In 2009, the international COSPAS-SARSAT satellite system discontinued satellite-based monitoring of the 121.5/243 MHz frequencies, in part because of a high number of false signals attributed with these frequencies. Satellite monitoring today utilizes the 406 MHz frequency only [10,11].

In USA Federal Aviation Administration (FAA) Issues Technical Standard Orders (TSO) which states a minimum performance standard for specified materials, parts, and appliances used on civil aircraft. Generally, these standards are followed by many countries.

- In 1985, a new TSO-C91A for ELT was issued, this was operating at 121.5 MHz frequency [9].
- In 1992, TSO C126 for ELT was issued, this was operating at 406 MHz frequency [12].
- In 2008, TSO C126a for ELT was issued, this was operating at 406 MHz frequency [13].
- In 2012, TSO C126b for ELT was issued, this was operating at 406 MHz frequency [14].

However, the International Civil Aviation Organization (ICAO) requires that ELTs carried in airplanes shall operate on both 121.5 MHz and 406 MHz. Though satellite system no longer identifies 121.5 MHz signal, it is useful for homing. [15,16]

Operation of an ELT:

Ideally, it is required that in the event of an accident, the ELT should get activated and should start emitting the radio beacons

at 406 MHz frequency signal and 121.5 MHz frequency signals periodically up to next 24 Hrs. or 48 Hrs. **For this, ELTs get triggered due to high g-force typical of airplane crash or temperature, whichever goes above the threshold first.**

The 406 MHz signal will be detected by the satellite network and its location can be estimated by satellite system using doppler triangulation or by GPS trilateration [10]. This location estimate will be provided to the Search and Rescue operation team and hence the survivors can be saved at the earliest (within golden hours).

Similarly, 121.5 MHz signal can be received by local ATC or nearby local observation center. This can help the Search and Rescue operations without satellite network.

Why the accident site cannot be located earliest despite having ELT:

The main reason for this is that **at about 40% of time ELT does not get activated** [17]. Hence no signal on 406 MHz frequency or 121.5 MHz frequency are available to be detected. Also, in some cases, the ELT gets damaged in the accidents mainly due to fire or due to the force of impact.

Issues with the present form of ELTs:

Airframe mounted ELTs are designed to automatically activate following an impact typical of a collision. However, the effectiveness of airframe ELTs in aviation accidents has been questioned by accident investigation agencies and by the aviation community. A government organization, Australian Transport Safety Bureau (ATSB) has done the research investigation to identify the safety concerns regarding the operation of ELTs and presented data on the effectiveness of ELTs activating following an accident. In this research investigation, the ATSB identified safety concerns regarding the operation of ELTs and presents data on the effectiveness of ELTs activating following an accident.

ATSB found that ELTs function as intended in only about 40 to 60 percent of accidents in which their activation was expected.

Therefore, the main issue with the present form of ELTs is that in the majority of cases it doesn't get activated. In some cases, the ELT gets damaged in the accident.

Accidents and Incidents where ELT is not damaged but does not get activated [18]:

- AN 32, Indian Air Force, Jun 2019, Arunachal Pradesh, India, ELT did not get activated in the crash.
- Cessna 182P Skylane June 2012, Maryvale Station (near Cunnamulla), Queensland, the fixed fuselage mounted ELT did not activate during the impact.
- B190, Blue River BC Canada, 2012 - The impact forces had not been enough for the ELT to be activated.
- Piper PA-30 Twin Comanche, May 2001, Archerfield Airport, Queensland, the ELT did not activate as a result of the initial impact.

- Mooney M20J from Jandakot to Laverton, Western Australia, 1998 - ELT was not activated despite high G-force of the accident.

Accidents and Incidents where ELT was damaged [18]:

- S76, vicinity Moosonee ON Canada, 2013 - The wreckage, which was near to the departure airport, was not located for over 5 hours after the ELT failed to function. The ELT failure was attributed to the tail boom-sited external antenna being severed.
- E190, en route, Bwabwata National Park Namibia, 2013 - No distress calls were made and no signal was transmitted from the ELT after the crash. This was

III. ENHANCEMENTS AND ALTERNATIVES PROPOSED

Despite many different ways to mount the ELT, the failure of the ELTs to get activated in the event of accidents remains the main reason for ELT not being useful and not being able to provide the Search and Rescue operations within time to the survivors.

Hence below mentioned additional enhancements are suggested to increase the ELT effectiveness and locate the accident site, even if ELT was not activated on accident.

These enhancements are suggested keeping in view the requirements of civilian as well as defense planes. Kindly note that these enhancements suggested below are also applicable for Underwater Locator Beacons (ULBs) unless stated otherwise.

1. It should be possible to activate ELT remotely using Radio Frequency signals (RF) so that even if the ELT is not activated in the event of an accident it can be activated via radio frequency signals before the search operations begin. For this, ELT should be provided with the ability to listen passively at a designated frequency or frequencies. When an ELT receives the activation signal for its own ID, at that particular designated frequency, it should get activated and start emitting the emergency beacon signals at 406 MHz frequency (and 121.5 MHz frequency).

2. It should be possible to send these activation signals via any of the below-mentioned methods:

2.1 Local ATC signals.

2.2 RF signals from the Search and Rescue team during SAR operation.

2.3 Satellite return link of the system like COSPAS-SARSAT. This is useful when the area where the accident happened is not known at all or the probable area is too big for the signals mentioned in the options 2.1 and 2.2 above.

3. However, in respect of the planes whose operations are critical in nature like defense planes, remote activation of ELT via radio frequency signals as mentioned above may become a security issue. If someone wants to know the location of that plane, then it may activate the ELT of that plane by sending the activation signals to that ELT. Once the ELT starts emitting the radio beacon, the location of the plane can be easily detected

found to be due to a break in the coaxial cable which linked the unit to the external antenna.

-
- MD83, en route, near Gossi Mali, 2014 - No signal was received from the ELT and it was found damaged at the crash site.
- C130J, en-route, northern Sweden 2012 - The ELT did not transmit and was found to have sustained major damage at impact.

even though the plane is operating normally. Hence ELT should be activated only on receipt of authenticated secure signals. It should be possible that such authenticated secure signal can be sent via any of the ways mentioned in point 2 above.

4. It should be required that one authenticated secure signal can be used only once. It should not be possible to re-use the same authenticated secure signal. This is required in view of the fact that these authenticated secure signals are sent via radio frequency, which can be easily captured off the air. If the restriction of using one authenticated secure signal only once is not imposed then it will be possible for the other entities to use such off the air captured signal to activate the ELT and locate the plane

It should be possible to activate ELT in any of the below mentioned ways

5.1 ELT can be activated such that ELT will keep on emitting the radio beacon for 24 to 48 Hrs. This is the normal way in which ELT is supposed to be activated in the event of an accident.

5.2 ELT can be activated such that ELT will emit one or two or some predefined number of beacons only. This mode will be useful when the search and rescue team will be activating the ELT during its search operation and such activation signals are sent from the device onboard with the search and rescue team. This will provide the efficient use of the battery in the case of accident and also, we can have the scope for more powerful beacons. This will also provide a longer battery life. Also, more power would also mean that the range of the transmitter will increase.

However, it should be possible that ELT can be activated in any of the modes via any of the link mentioned in 2 above.

6. It should be explored whether ELT cab is integrated with the Blackbox such that it will suffer minimum physical damage.

7. In view of point 6 above, it should be explored whether some part of the Blackbox can be used as an antenna of the ELT, as in

many cases the antenna is known to break and unable to transmit any signal.

8. In addition to the above-mentioned enhancements, further to increase the probability of locating the plane in the event of an accident, it is suggested that the flight control monitoring all the parameters which include, but are not yet limited to airspeed, altitude, pitch, yaw, roll, GPWS (Ground Proximity Warning System) along with excessive flight inputs to predict crashing probability (for example when more than 2 of the parameters are showing negative prognosis) and transmit a distress signal while it is happening before crash. It allows the system to use aircraft antennas which are much more powerful. The ELT can be configured such that, if the signal from any of these devices (which are placed at different locations inside the plane) is not received continuously, indicating a situation of an emergency/accident or if the parameters indicating the emergency situation are received by the ELT from such devices, ELT should get activated. The main advantage of this arrangement is that; in most of the accident cases, ELT will get activated even before the airplane touch the ground/water in the event of an accident, thus before any damage can occur to antennas.

8.1 The above method would also allow us to send more detailed information to satellites, and multiple pings can also show the flight path.

8.2 The above method will also allow for more detailed information to be sent in real time, especially now when a plane can be permanently connected to satellites such as SpaceX's Starlink, which will have worldwide coverage in coming years.

8.3 In the above method, a switchable "stealth mode" can be added to defense aircraft as they can encounter highly variable parameters during testing/ exercises/ war. This would enable the plane to temporarily disconnected from commercial satellites, and thus cannot be tracked.

9. In the future, if there is a return of supersonic commercial passenger jet flight, the forces produced in an accident would become too high to be sustained by the black box. The specifications needed by the black box would not be practical. In this scenario, the above method mentioned in 8 would be the only viable solution.

10. The alternate method consists of a smaller independent beacon which can be ejected just before the aircraft touches the ground. It will have the same working as explained in 8, and its time of ejection will primarily depend on the altimeter, once it is verified that crash is imminent. Can also have a parachute to have a safer landing. It can also have buoyancy (not by additional hardware like floats, but inherently due to its shape and build).

11. In commercial passenger jets, any person should not be able to fiddle with or turn off safety systems like ACARS (aircraft communications addressing and reporting system), which is used

to track planes via satellites. To ensure this, it can be integrated with the black box so that it becomes physically inaccessible to any person on board. It is theorized that the captain of MH370 turned off ACARS, and that is the main reason anyone has failed to relocate the plane even 5 years after it went missing.

IV. CONCLUSION

Providing above mentioned enhancements in the ELT and ULB can significantly increase their activation rate for the planes in case of an accident and thereby significantly increasing the chances of the rescue of the survivors. Above mentioned enhancements will not pose any security risk to the civil aviation planes as well as defense planes. There is no downside of the above enhancements mentioned, except marginal additional cost. Hence these enhancements should be considered by the manufacturers as an additional feature of their product till the time authorities make it a mandatory requirement.

The Effect of Crop Rotation On Soil Essentials Elements

Ariuntsetseg Dugar, Davaa Lkham, Solongo Gonchig

School of Agroecology, Mongolian university of life science, Mongolia

DOI: 10.29322/IJSRP.9.08.2019.p9217
<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9217>

Abstract- Usually short turnover of our country's soil and climatic conditions and crop rotations, type of crop, there are few deficiencies. Therefore, soil and climate conditions change and warming to ongoing the dispensation extend substitutions, diversification of crop.

Evaluating crop rotation in the environmental and climate change have intensified agroecologically sensitive conditions central agricultural area production of grain, studied the major nutrient elements based on a long-term resident survey in the brown soil.

The correlation between soil total carbon and total nitrogen $r = 0.92$ deep plow soil (0-20 cm), $r = 0.63$ subsoil deep (20-40 cm) or is strong and moderately dependence. Accordingly, crop rotation it looks evaluating to be possibly the major elements of the soil.

Index Terms- carbon, nitrogen, crop, fallow, wheat

I. INTRODUCTION

Farming has drawn special attention in the cropped framing scientific study of crop rotation. Crop rotation is many fields growing fallow and crop space and time. Crop rotation in the additionally incurring of soil physical, chemical, and biological properties, special effects to crops that became definite. Usually a short turnover of our country's soil and climatic conditions and crop rotations, type of crop, there are few deficiencies. Therefore, soil and climate conditions change and warming to ongoing the dispensation extend substitutions, diversification of crop.

The aim of the study will be evaluating crop rotation in the environmental and climate change have intensified agroecologically sensitive conditions central agricultural area production of grain, studied the major nutrient elements based on a long-term resident survey in the brown soil.

Purposes

- The influence of crop rotation into soil nutrient contents of the resident research field
- Comparison between crop rotation versions

II. MATERIALS AND METHODS

Location: "NART" Research, Training and Production Center, MULS, Bornuur Sum, Tov Aimag (N48°41' E 106°15'). The annual mean precipitation at Nart is 160-235 mm with a mean annual maximum temperature of 18°C. The experimental plots at Nart were located on Mollisol and Kastanozem soil. These soil series consist of dark-brown colored, low deep soils with a slope of <2%, developed in loess 1.5 to 2 m thick over till under prairie vegetation. Soil pH(H₂O) 7.0~7.6, soil electrical conductivity 0.06~0.14 dS m⁻¹, Max. Water Holding Capacity 44~55%(W/W), Bulk density (0-20cm) 1.14~1.35 g cm⁻³, Total corban (Plow layer) 15~20 g kg⁻¹, total nitrogen (Plow layer) 1.6~2.0 g kg⁻¹, Available Nitrogen (Plow layer) 60~80 mg kg⁻¹ (Toriyama, K. Davaa, L. Solongo, G. Yamasaki, S.). Soils were sampled in May and September 2016 at the Nart site, this followed at least six full cycles of the 3-yr rotation at both sites. At the Nart site, three soil cores with 3.1 cm diam. were taken with a hand-held split-core sampler in each subplot. Samples were cut in the field at depths of 0 to 20 cm, 20 to 40 cm, and stored in plastic bags in a refrigerator.

Field experiment variants were:

- Wheat with fallow- (fallow-wheat-wheat)
- Wheat cont.14 yrs- Wheat cropped for 14 years
- Rotation A -potato-oat/barley-fallow-wheat
- Rotation B - corn- barley/oat- potato-wheat

- Rotation C -millet- green manure-potato-wheat
- Rotation D- oat-mustard-potato- wheat

Soil total carbon (TC), total nitrogen (TN) and available nitrogen (Av.N) were analyzed for top soil (0-20cm) and sub soil (20-40cm).

Laboratory research methods:

- Total carbon and nitrogen of combustion method by Sumigraph NC-830 °C
- Available nitrogen of incubation with upland moisture (ca. 20% W/W) after 10 weeks at 30 °C inorganic N was determined

III. STUDY RESULTS

Crop rotation is to keep the quality of the soil organic matter. Effect rotations, crop rotation, and planted farming system, depending on the type of soil organic matter content are kept stable.

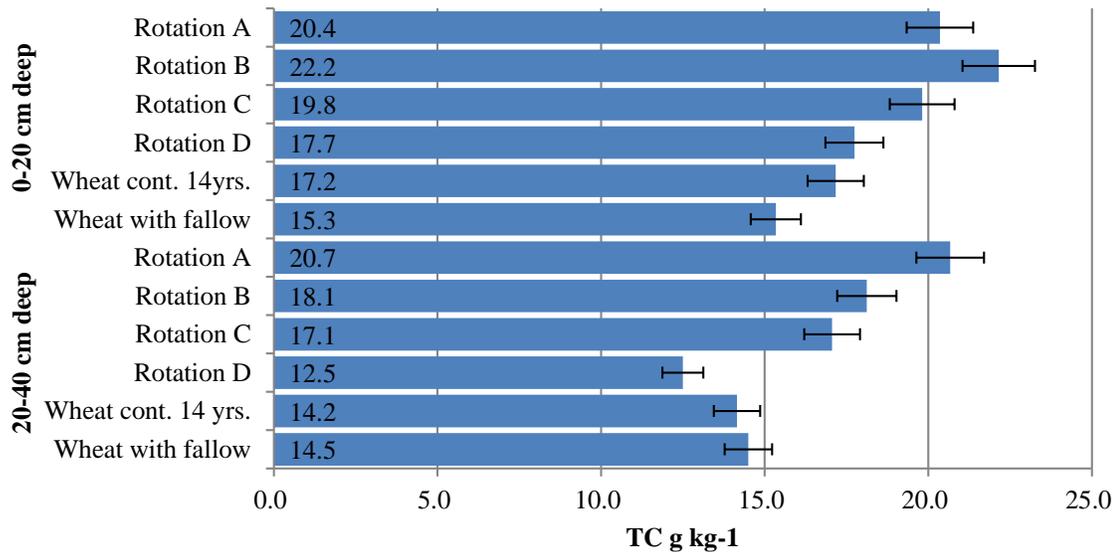

Figure 1. Effect of crop rotation on soil total carbon

Soil carbon in the 0-20 cm depth experience in rotation B version most more or other versions was more 1.8-6.9 g kg⁻¹, wheat with fallow version minimum or other versions of 1.9-6.9 g kg⁻¹ lower. Conspicuously to the total carbon in the 0-20 cm depth of soil concentrations rotations in planted types has shown that while many more.

However, amount of the total carbon to a depth of 20-40 cm in rotation A most more or other versions were more 2.6- 8.2 g kg⁻¹, rotation D version minimum or other versions of 1.7-8.2 g kg⁻¹ lower. Crop rotations in the mustard version of the low accumulation of organic carbon content are related to lower leaves.

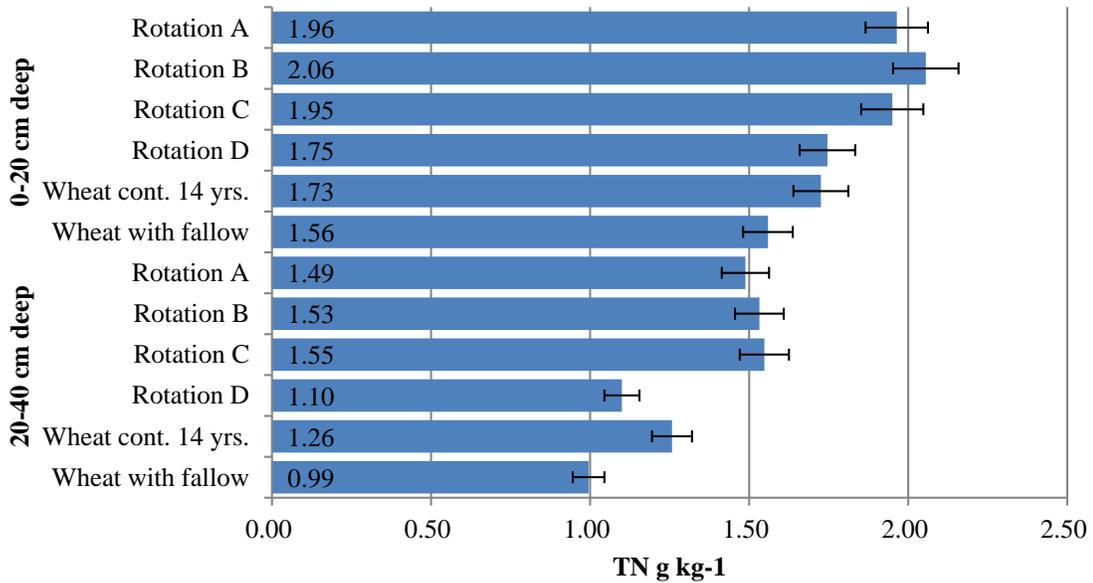

Figure 2. Effect of crop rotation on soil total nitrogen

This table has been showing that soil total nitrogen was more 0.1-1.07 g kg⁻¹ rotation B (corn- barley/oat-potato-wheat) version than other versions. It is a crop rotation version leave the green mass and cultivation is related to specifics the soil.

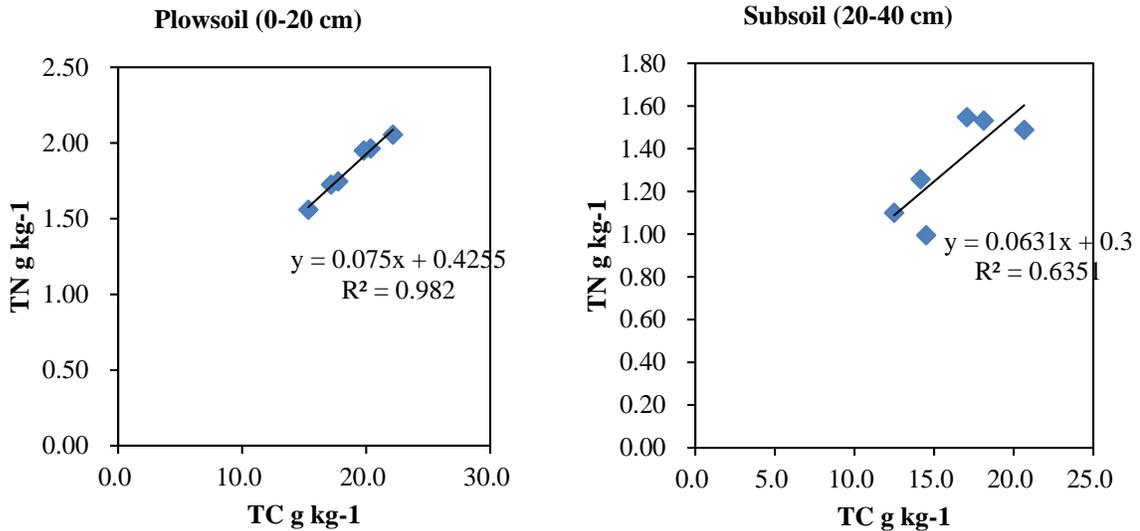

Figure 3. Correlation between soil total carbon and total nitrogen

The correlation between soil total carbon and total nitrogen $r = 0.95$ deep plow soil (0-20 cm), $r = 0.79$ subsoil deep (20-40 cm) or is strong and moderately dependence. Accordingly, crop rotation it looks evaluating to be possibly the major elements of the soil.

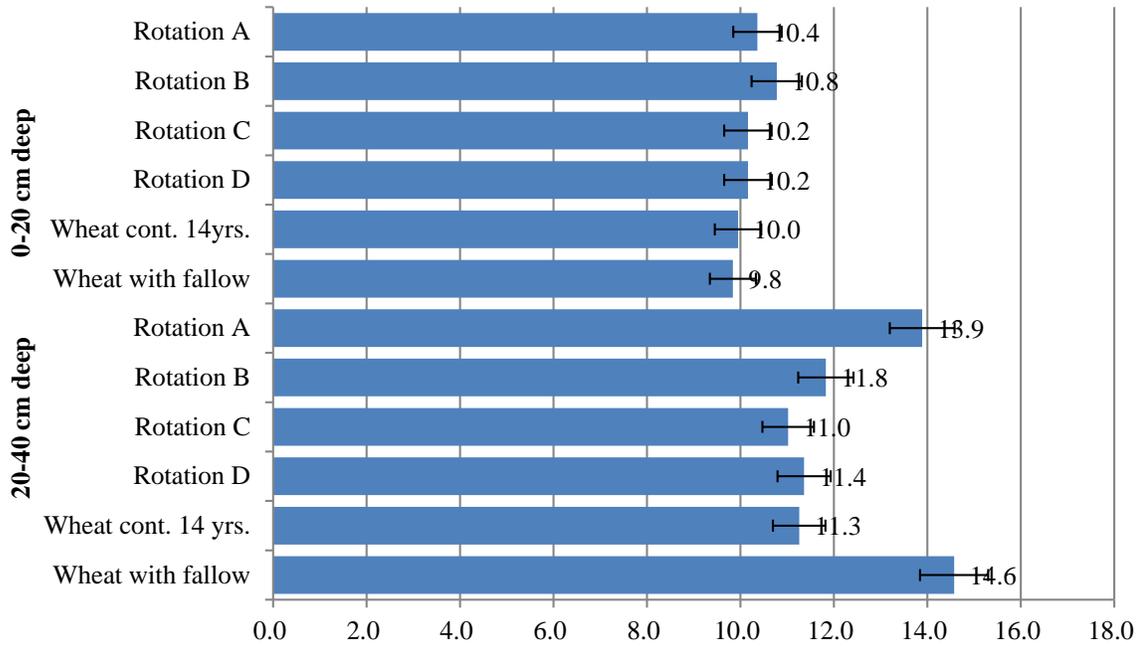

Figure 4. Soil carbon and nitrogen ratio

Total carbon and nitrogen ratio rotation B the highest C: N = 10.8 in the 0-20 cm depth. Experience, which shows that the total area of mineralization appears to have been low. Total carbon and nitrogen ratio wheat with fallow the highest C: N = 14.6 in the 20-40 cm depth. Subsoil at wheat with a fallow version of the C: N ratio is plowed fallow explain the link to the rotation.

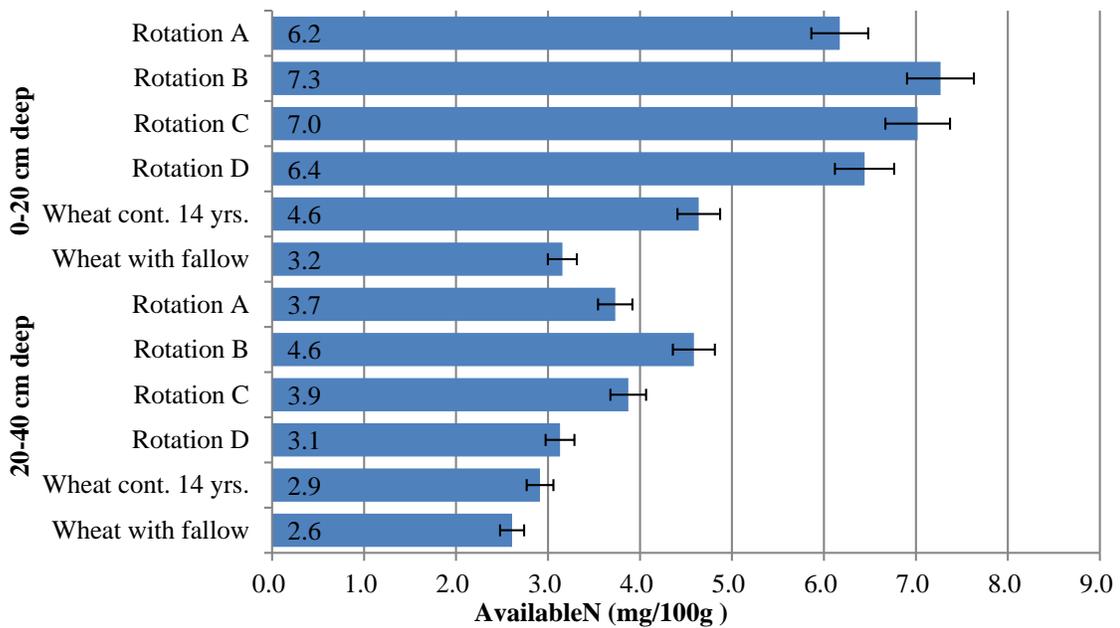

Figure 5. Effect of crop rotation on soil available nitrogen

Soil available nitrogen contents in the plowed soil were 7.3 mg in 100gr dry soil is the maximum of rotation B but was 3.2 mg in 100 gr dry soil is the minimum of wheat with fallow version. Soil available nitrogen contents in the subsoil were 4.6 mg in 100 gr dry

soil is the maximum of rotation B version but was 2.6 mg in 100 gr dry soil is the minimum of wheat with fallow. Accordingly, if the soil is available nitrogen at a plow soil ongoing tends to be subsoil than ever mineralization of the soil ($r = 0.73$).

IV. CONCLUSION

According to the results of our study

Rotation versions the rotation B ($C=22.2$ g kg⁻¹, $N=2.06$ g kg⁻¹, $Av.N=7.3$ mg 100gr⁻¹) version of the best performance, crop rotational agricultural technology and economically need to add the important sown.

Under wheat production system, fallow system might enhance the decrease trend of soil fertility.

At the end of the evaluation of is showing that there is a need to increase the number of rotations in sown

Abstract- Abstract. This study aims to find out how much customer content creator is in the Indonesian News Agency Perum LKBN Antara South Sumatra. This study aims to determine the effect of product quality on customer loyalty content creator services at the Indonesian News Agency Perum LKBN Antara South Sumatra. The sample in this study amounted to 112 respondents with the sampling technique using the census method. The data analysis used in this study is multiple linear regression analysis using the SPSS 20.0 program. The results of this study indicate that product quality and price variables have a positive and significant influence on customer loyalty. Product quality variables have a more dominant influence on customer loyalty in content creator services at the Indonesian News Agency Perum LKBN Antara South Sumatra.

Index Terms- Product Quality, Price, Customer Loyalty

I. INTRODUCTION

The Indonesian news agency LKBN ANTARA is a public company (perum) which has the status of a State-Owned Enterprise (BUMN). LKBN Between South Sumatra as a representative office of South Sumatra is a business engaged in the media industry which is in charge of serving the community both business institutions and government institutions relating to mass media publishing services or information media in South Sumatra.

In carrying out every business activity customer loyalty is very important for the service industry such as Between South Sumatra. This is because service products are very difficult to define objectively because the intangibility and complexity of services affect the way consumers evaluate the services they buy. Therefore in the service industry, product quality and price offered are important elements that must be considered to create customer loyalty.

High product quality and an appropriate pricing strategy are weapons for Antara Sumsel to stay afloat and remain an option in the midst of intense competition, especially in services such as information media services that are carried out by South Sumatra. The following is a list of product content creator services offered to Antara Sumsel customers, as shown in Table 1.

Table 1. Indonesian News Agency Services Offering LKBN

Antara South Sumatra		
No.	Types of products	Product Content
1.	Special page a	Making independent channels / pages / rubrics. Contains news text and photo content in a special separate document owned by the installer, without being mixed with other content. This service is very suitable for government-owned and private businesses that want publications in real time and in large quantities. This service can also be customized into the installer's website as an ingredient for updating content via an RSS feed, so it will automatically be updated every time the special page is updated.
2.	Advertorial	Publication services for government-owned, private and individual business entities in the form of text and photo news. Content placement will be adjusted to the existing rubric theme..
3.	Web Banner	Promotional media services in the form of advertisements in the form of text / animated images of a certain size are installed in the portal page www.antarasumsel.com. These ads will contain links / links that will guide the destination of the targeted / promoted website. The advantages of this service are advertisements in the form of a combination of text and animated images so that it draws the attention of the reader to click on the . By clicking means the website that is being targeted / promoted gets visitors from the website that directs it, while getting backlinks from the main website as one way to popularize the targeted .

			20,000,000,-s/d	5,000,000,-	s/d	3,000,000	s/d -
3	Banner		50,000,000,-	10,000,000,-		5,000,000,-	

Source: Indonesian News Agency Public Corporation LKBN Antara Sumsel

Based on the data in Table 2 you can see the list of product content creators and the benefits offered and the operational costs that must be fulfilled in each product service. On the list the higher the operational costs incurred, the higher the quality of advertising content obtained. Such as the display of color ads, greater layout capacity, the use of videos with 4K quality, audio, video drones, creative advertising ideas (scripts / storylines) and others

Table 3. Amount of Order of Indonesian News Agency Perum LKBN Antara Sumsel

112 customer recapitulation	Order/Year		
	2016	2017	2018
Total	961	845	880
Difference	-	116	35
Percentage	-	12.07%	4.14%
Status	-	(-)	(+)

Source: Indonesian News Agency Public Corporation LKBN Antara Sumsel

Based on the data in Table 3, it can be seen that there was a decrease in the number of orders in 2017 at 12.07%. although then in 2018 there was an increase, but the increase was not so significant at only 4.14%.

Table 4. Amount of arrears of the Indonesian News Agency Perum LKBN Antara Sumsel

No	Year	Total Order	Amount of Arrears	Percentage
1	2016	961	115	11.97%
2	2017	845	107	12.66%
3	2018	880	112	12.73%

Source: Indonesian News Agency Public Corporation LKBN Antara Sumsel

In Table 4, the data on the number of trips shown during the period 2016-2018 is displayed. In these data it can be seen that the number of orders in arrears per year reaches a fairly high number, which ranges from an average number of 12%. According to Indra Gultom (Head of the Antara Sumsel) the decrease in the number of orders and arrears was allegedly due to the current level of competition for content creator services among existing media service providers, especially in the city of Palembang. There are many new content creator service providers that have sprung up from starting professionals to amateurs, such as Palembang Terkini, Plg_vidgram, detik.com, Tribun News, and others. The emergence of these competitors directly makes alternative choices of content creator services more diverse, making customers have many choices to determine which content creator services are the best and according to their needs.

Based on the background above, encourage researchers to conduct research with the title **“The Effect Product Quality And Price On Loyalty Of Content Creator Service Customers In Office Of Indonesia News Perum LKBN Antara (Case Study at The Indonesia News Antara Biro South Sumatra)”**.

A. Formulation of the Problem

Based on the background described, it can be identified the formulation of the problem in this study in the form of questions as follows:

- 1) How does product quality affect customer loyalty in the Indonesian News Agency content creator LKBN Antara South Sumatra?
- 2) How do prices affect customer loyalty content creator services Indonesia News Agency LKBN Antara South Sumatra?

II. LITERATURE REVIEW

A. Consumer Loyalty

Loyalty is a manifestation of the behavior of decision-making units to make continuous purchases of goods for the services of a selected company (Griffin, 2013: 15).

B. Product Quality

Product quality (product quality) is the ability of a product to demonstrate its function and is one of the most reliable factors by a marketer in marketing a product (Kotler and Armstrong, 2012: 283). Therefore, improving the quality of products or services is an important challenge for companies to compete in the global market. Improving product quality will reduce costs and increase competitive advantage, even further, high product quality creates a long-standing competitive advantage. Therefore, quality is an important factor that drives the economic growth of companies anywhere in the world in the context of global markets.

C. Price

Price is a sum of money that is billed for a product or service or the amount of value that is exchanged by customers to benefit from owning or using a product or service (Kotler and Armstrong, 2012: 345). Price is a number of values of a given currency for a product or service that is useful to provide value to a product or service offered.

A. Relationship Between Variables and Development of Hypotheses

1) Effect of Product Quality (X1) on Customer Loyalty (Y)

Quality products have an important role to shape customer satisfaction. The higher the quality of products and services provided, the more satisfaction customers feel about the quality of the products and services provided, it can generate benefits for these products. Likewise, vice versa, if there is no satisfaction it can result in customers moving to other products because the quality of the product is closely related to customer loyalty. If the goods and services purchased match what consumers expect, there will be customer satisfaction or loyalty and vice versa. If the pleasure that consumers get exceeds their expectations, then consumers will really feel satisfied and they will certainly continue to make repeat purchases.

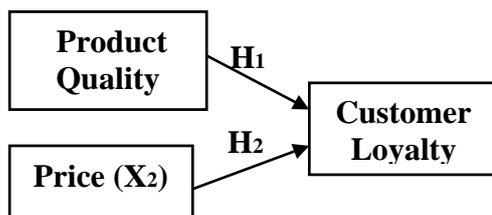

H1: Product Quality has a positive and significant effect on Customer

2) Price Effect (X2) Against Customer Loyalty (Y)

Price is something that is very important for customers because for customers the price is often used as an indicator of value when the price is associated with the perceived benefits of goods / services consumed. Customers feel that they match the price paid for the goods they buy, so the customers will automatically be loyal to repurchase at that place.

H2 : positive and significant effect on Customer Loyalty

A. Conceptual Framework for Thinking

Picture 2.1 A. Conceptual Framework for Thinking

III. RESEARCH METHODS

This study intends to measure the relationship between research variables. This study is useful for measuring the relationships between research variables or useful for analyzing and seeing the effect of independent variables (X) on the dependent variable (Y).

The design of this study is as follows:

1. Variable X (Free Variable), namely Product Quality and Price
2. Variable Y (Bound Variables), namely Customer Loyalty

In this study, respondents in this study were all regular customers between South Sumatra in 2018 which became a population with 112 customers and all of them were the number of respondents in this study..

IV. RESULTS AND DISCUSSION

A. Research Result

Validity test

Table 5. Validity Test Results

Indicator	Product Moment Pearson's	Sig.		α	Information
X1.1	0,354	0,000	<	0,05	Valid
X1.2	0,512	0,000	<	0,05	Valid
X1.3	0,564	0,000	<	0,05	Valid

X2.9	0,613	0,000	<	0,05	Valid
X2.10	0,621	0,000	<	0,05	Valid
Y.1	0,487	0,000	<	0,05	Valid
Y.2	0,464	0,000	<	0,05	Valid
Y.3	0,428	0,000	<	0,05	Valid
Y.4	0,491	0,000	<	0,05	Valid
Y.5	0,546	0,000	<	0,05	Valid
Y.6	0,606	0,000	<	0,05	Valid
Y.7	0,456	0,000	<	0,05	Valid
Y.8	0,590	0,000	<	0,05	Valid
Y.9	0,646	0,000	<	0,05	Valid
Y.10	0,457	0,000	<	0,05	Valid

Source: Processed from Questionnaire, 2019

Based on Table 5 it is known that each indicator (item) in each product quality and price variable (independent variable) while customer loyalty (dependent variable) has the result of Product Moment Pearson's value with a significance value of 0.032; 0,000 <0,05, so that the indicators (items) used in this research variable can be declared appropriate or relevant and can be used as items in data collection.

Reliability Test

Table 6. Reliability Test Results

Variable	Cronbach's Alpha	Cutt Off	N of Item	Information
Product Quality (X1)	0,733	> 0,60	10	Reliable
Price (X2)	0,723	> 0,60	10	Reliable
Customer loyalty (Y)	0,720	> 0,60	10	Reliable

Source: Secondary Data, processed 2019Sumber

Based on the results of the instrument variable reliability test in Table 6, then the results of the reliability test of independent product quality (X1) and price (X2) indicate that the data obtained is reliable because Cronbach's Alpha value is 0.733, 0.723 while the dependent variable reliability test results are customer (Y) shows that the data obtained is reliable because the value of Cronbach's Alpha is 0.720.

Analysis of Multiple Linear Regression

Table 7. ANNOVA: Effect of Independent Variables (X) Together on Dependent Variables (Y)

Model		ANNOVA ^b				
		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	616.181	2	308.090	17.924	.000^a
	Residual	1873.586	109	17.189		
	Total	2489.777	111			

a. Unbound Variables: Product Quality and Price
b. Bound Variables: Customer Loyalty

Source: Processed from Questionnaire, 2019

Based on the results in Table 7 above, it can be seen that the results of the test simultaneously (F test) in the ANNOVA table obtained a value of F_count of 616,181 greater than the F table value at the confidence level of 94%. To get results from F table can be calculated using the formula $F_{table} = F(n - k)$, then $F_{table} = 112 - 3 = 109$, then it can be seen from the result table 2.69% ($F_{count} 616.181 > T_{table} 2.69$) and level of value significant probability $F = 0,000$ smaller than Alpha 0.05 ($Sig. F = 0,000 < \alpha 0,005$). So it can be seen from the table above, it can be concluded that the product quality variable (X1) and price (X2) together have a significant effect on customer loyalty (Y).

Feasibility Test Model (Test F)

Table 8. Model Feasibility Test Results

Model		ANNOVA ^b				
		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	440.685	2	220.343	11.801	.000^a
	Residual	2744.647	147	18.671		
	Total	3185.333	149			

c. Independent Variables: Product Quality and price
Dependent Variable: Customer Loyalty

Source: Processed from Questionnaire, 2019

n Table 8 above, it can be seen the results of the model feasibility test (F test) in the ANNOVA table obtained that the value of F_count is 11.801 greater than the F table value at the confidence level of 94%. To get the results from F table can be calculated using the formula $F_{table} = F(n - k)$, then $F_{table} = 150 - 3 = 147$, then it can be seen from the result table 2.67% (count

11.742 > T table 2.67) and level of value significant probability $F = 0,000$ smaller than Alpha 0.05 (Sig. $F = 0,000 < \alpha 0,005$). So it can be seen from the table above, it can be concluded that the variables of product quality (X1) and price (X2) together have a significant effect on customer loyalty (Y).

Individual Parameter Significance Test (t Test)

Table 9. Koefisien Regresi

Coefficients						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
1		B	Std. Error	Beta		
	(Constant)	18.225	3.630		5.021	0,000
	Kualitas Produk	0,277	0,073	0,337	3.816	0,000
	Harga	0,282	0,093	0,269	3.039	0,003
a. Bound Variables: Customer Loyalty						

Source: Processed from the Questionnaire, 2019

Based on the results of the t-test analysis calculation in Table 9, it can be described as follows:

1. Product quality variable (X1), has a beta value of 0.277 with a significant value of 0,000 which is smaller than 0.05. This means that product quality variables have a positive and significant effect on customer loyalty
2. Price variable (X2), has a beta of 0.282 with a significance value of 0.003 which is smaller than 0.05. This means that the price variable has a positive and significant influence on customer loyal.

B. Discussion of Research Results

1. Effect of Product Quality (X1) on Customer Loyalty (Y)

Product quality has a positive and significant effect on customer loyalty. From the results of the study obtained coefficients for product quality variables of 0.277 with a significant value of 0,000 where this value is significant at the 0.05 significance level because it is smaller than 0.05. Thus, that product quality has a positive and significant effect on customer loyalty.

Quality products have an important role to shape customer satisfaction. The higher the quality of products and services provided, the more satisfaction customers feel about the quality of the products and services provided, it can generate benefits for these products. Likewise, vice versa, if there is no satisfaction it can result in customers moving to other products because the quality of the product is closely related to customer loyalty. If the goods and services purchased match what consumers expect, there will be customer satisfaction or loyalty and vice versa. If the pleasure that consumers get exceeds their expectations, then consumers will really feel satisfied and they will certainly continue to make repeat purchases.

Based on the results of research and interviews with several respondents in the field, found results that consumers already felt the quality of the products produced by the Indonesian News Agency between the South Sumatra LKBN Perum had been very good. Consumers feel that the product produced is of good quality. The Indonesian News Agency Between South Sumatra LKBN needs to improve the quality of its produced products such as the products produced can convey more clarified information so that readers can easily understand what is meant. In addition, the resulting image quality results need to be improved by improving image quality so that better results need to be supported by more modern tools so that consumers feel that the products produced by the Indonesian News Agency LKBN Antara Sumsel have very good quality if compared to products produced by other companies.

These findings are in accordance with the results of research from Agus (2018); Aprilia (2018); Herviana (2018); Putu (2018); Putu Sundari (2018); Sri (2018); Elinawati (2017); Silfrany (2017); Eugenia (2016); Heri (2016); Novie (2016); Angelia (2015); Abdul (2014); Rifqi (2013); Agung (2012) supports that Product Quality has a positive and significant effect on Customer Loyalty. While the research from Melysa (2013) says that Product Quality variables have a positive and not significant effect on Customer Loyalty.

2. Effect of Price (X2) Against Customer Loyalty (Y)

Price has a positive and significant effect on customer loyalty. From the results of the study obtained coefficients for the price variable of 0.282 with a significant value of 0.003 where this value is significant at the 0.05 significance level because it is smaller than 0.05. Thus, that price has a positive and significant effect on customer loyalty.

Price for customers is used as an indicator of value when the price is associated with perceived benefits for goods / services consumed. Customers feel that they match the price paid for the goods they buy, so the customers will automatically be loyal to repurchase at that place.

Based on the results of research and interviews with several respondents in the field, found results that consumers already felt that the prices set by the Indonesian News Agency Perum LKBN Between South Sumatra had been very good. But the Indonesian News Agency Antara Sumsel LKBN needs to adjust the prices set with other production costs and competitors. The Indonesian News Agency Between South Sumatra LKBN needs to consider the pricing of products produced with the prices of similar products produced by other companies. By doing this, it is useful for the Indonesian News Agency Between South Sumatra LKBN Company to provide the right price for the products produced. The price given is good, can create customer loyalty to always make purchases. In addition, the Indonesian News Agency Antara Antara South Sumatra LKBN needs to provide discounts that attract consumer interest in order to remain loyal to the Indonesian News Agency Perum LKBN Between South Sumatra.

These findings are in accordance with the results of research from Aprilia (2018); Herviana (2018); Paulus (2018); Sri (2018); Andry (2018); Made (2017); Nita (2017); Novie (2016); Risiko (2016); Eric (2015); Istifau (2015); Suwandi (2015); Tulandi (2015); Padma (2014) supports that Price has a positive and significant effect on Customer Loyalty.

V. CONCLUSIONS AND RECOMMENDATIONS

Conclusion

This study examines whether product quality and price can influence customer content creator loyalty. The test results using multiple linear regression analysis with two independent variables namely product quality and price and one dependent variable customer loyalty shows that:

1. Product quality variables have a positive and significant effect on customer loyalty in content creator services at the Indonesian News Agency Perum LKBN Antara Sumsel.
2. Price variables have a positive and significant effect on customer loyalty in content creator services at the Indonesian News Agency LKBN Antara South Sumatra

VI. RECOMMENDATIONS

Based on the results of the research, discussion, and conclusions above, some suggestions can be proposed to get better results as follows:

1. For the Indonesian News Agency Perum LKBN Antara South Sumatra

a. The quality of the products produced is very good. But it needs to be added again that the products produced can convey clear and easy to understand information so that consumers can quickly clear and understand the purpose of the products produced. In addition, the quality of the images produced needs to be improved which needs to be supported by modern and latest technology so that the quality of the products produced is even better.

b. The price set by the Indonesian News Agency between the South Sumatra LKBN Perum has been very good. The price set is in accordance with the results of the products produced. But it should be noted that companies need to consider each product price produced must be in accordance with the price set. The company also needs to do research on other companies that sell the same product. The Indonesian News Agency Antara South Sumatra LKBN needs to compare prices set with prices set by other companies. With that, the Indonesian News Agency Antara South Sumatra LKBN can set the right price for the quality of the products produced in order to cause a sense of customer loyalty still occur.

2. For Further Researchers

For further researchers who are interested in researching this research, it is better to examine the company's image, price, consumer loyalty and so on and can expand the sample to strengthen and produce good research.

Law Enforcement Against Criminal Acts of Household Violence in Ambon City

Husin Wattimena, Gazali Rahman

Lecturer at the Faculty of Sharia and Islamic Economics, Ambon-Indonesia Islamic Religion Institute

DOI: 10.29322/IJSRP.9.08.2019.p9219
<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9219>

Abstract- Domestic violence usually affects wives or children. Husband's violence against his wife is considered an internal problem, both by outsiders and by people in the family itself. Domestic violence according to Law Number. 23 of 2004 is the act of someone against other people, especially women or deprivation of independence against law in the household sphere. The substance of Law Number 23 Year 2004 is very pro-women, while the criminal justice system should make law a spirit in law enforcement.

The method used in this study is empirical juridical research with the nature of descriptive research that uses primary and secondary data sources with document study techniques and interviews as well as reading sources related to existing problems. This study uses a number probability sampling technique that is purpose sampling in determining the research sample. The overall data that has been obtained, analyzed qualitatively or qualitative descriptive analysis. Based on case study completion, domestic violence in Ambon City based on Law Number 23 of 2004, is applied in a textual and positivistic manner, resulting in greater problems. On the other hand, the application of law to the settlement of criminal acts of domestic violence based on Law Number 23 of 2004 which is used as the last alternative legal settlement solutions through a pathway outside criminal law (number-reasoning), can number longer solve a win-win solution. The police as law enforcers should be a mediator for solving problems in a win-win solution, and this does number conflict with applicable law, because in the most ideal legal function is to solve problems without problems to seek justice. The police must be more prudent in examining a case to be able or number to submit a case to court.

Index Terms- peaceful settlement of cases is the key to legal justice

I. INTRODUCTION

Generally people assume that the environment outside the home is more dangerous than in the house. This assumption could be formed because crimes that are revealed and published are crimes that occur outside the home environment, while houses are considered a safe place for family members and the people who live in them, can interact with a foundation of love, mutual respect, and respect, but it is number unexpected that a house can be the most terrible place for family members. This is stated because often violence in whatever form and degree, it turns out that it can occur in the house among people who should love and respect each

other. People who should be able to be a place to share and take refuge turned out to be the source of suffering. Domestic violence usually affects wives or children who, according to social construction, are considered as second class citizens. In a family building. According to Mansour Fakhri, as a gender bias between men and women manifested in various forms of injustice, including: marginalization, subordination, and the formation of stereotypes or negative labeling, violence, more workloads.

Based on the opinion of Mansour Fakhri and Ita F. Nadia, it appears that the imbalance of gender equality in the relations of men and women as husband and wife in the household can be one of the factors causing domestic violence, especially by husbands towards their wives. According to Kristi Poerwandari, this type of violence is very difficult to reveal because: 1). In general, people assume that violence against wives is number normal. 2). Husband's violence against his wife is considered an internal problem, both by outsiders and by people in the family itself. 3). Actors and victims cover up the event for various reasons.

Law enforcement through the criminal justice system is currently under sharp scrutiny from various parties, even the international community who consider judicial institutions in Indonesia to be very bad, especially those carried out by law enforcement elements ranging from police, prosecutors, judges to prison officials. Justice is a matter that refers to all court activities in carrying out its functions namely law enforcement and enforcement of justice. Law, through the criminal justice system, which actually plays its function as a means to resolve conflicts, uphold truth and justice. In fact, it can be a means of social engineering for the community. The reality actually causes prolonged social anarchy.

The criminal justice system must make progressive law a spirit in law enforcement, especially the police, prosecutors and courts, because, "law is for humans, number humans for law". This idea is an antithesis of the characteristics of the criminal justice system that still "cultivates" modern law, so that it is considered unable to bring justice to justice seekers anymore. Indonesian republic police in its decision or action to settle a criminal case that is dealt with based on the law on the basis of the situation and conditions, according to the consideration and decision of his own conscience in the public interest. Therefore, indirectly the discretion of the police can be said as one of the progressive law enforcement in the settlement of criminal cases.

Law enforcement through the criminal justice system is currently under sharp scrutiny from various parties, even the international community who consider judicial institutions in Indonesia to be very bad, especially those carried out by law

enforcement elements ranging from police, prosecutors, judges to prison officials. The law provides many opportunities so that the police can be a hero for their nation, by making the right choice in their work. The substance of Law Number 23 Year 2004 is very pro-women. However, problems arise when this law is applied textually. Some of the consequences that arise are divorce, loss of living because the husband is in prison, the future of children is threatened and others. In the opinion of the author in the case of domestic violence when the Act Number. 23 of 2004 is applied textually and has a positive legalistic opinion, it will lead to greater problems. Because the criminal law in this case Law Number 23 of 2004 is used as a last alternative if the legal problem resolutions with lines outside the criminal law (number-reasoning) have been unable to resolve with a win-win solution. Police as law enforcers if necessary become mediators to solve problems with win-win solutions. This does number conflict with progressive law because the most ideal legal function is to solve problems without problems and seek justice. Polri must be more wise in determining a case to be able to go to court. Satjipto Rahardjo said that for the police, carrying out criminal law is number like drawing a straight line between two points, but it can be full of sociological and humanitarian struggles. The police-police who perceive policing are number merely implementing command of the law, carrying out their duties by utilizing discretionary institutions, where they can choose between continuing the process legally or stopping it. To choose to stop or number fight someone requires a vision that is more complex than just applying the law

Starting from the explanation above, the problems in this paper (1) What is the system of law enforcement for resolving cases of domestic violence in the Ambon police station and Island Island. Lease? (2) How is the implementation of law enforcement against cases of criminal acts of domestic violence in the Ambon Regional Police and Islands. Lease? (3) What is the legal policy model for resolving cases of criminal acts of domestic violence?

B. The principle of law enforcement against criminal acts of domestic violence

1. Application of the Law for the Elimination of Domestic Violence

Law number. 23 of 2004 concerning the Elimination of Violence in the Family Household is a legal rule governing the social relations of a household, where the household becomes the first social environment number to humans. In the human family learn to start interacting with other people. Because of that, most people spend a lot of time in a family environment.

Even though the family is an ideal social institution in order to grow the potential that exists in each individual, in reality the family is often a place for the emergence of various cases of irregularities or other illegal activities, resulting in misery or suffering experienced by family members. Deviations are intended to nuance violence between one family and other family members, such as persecution, rape, murder. This situation is often referred to as Domestic Violence. In general, in the kinship structure in Indonesia, men are placed in a dominant position, namely as the head of the family, so it is number unusual if later other family members become very dependent on men. Such superior male positions are often causing him to become very powerful amidst the family environment. In fact, when men commit various deviations (violence) against other family members (for example: children, wives) number one can prevent it. Worse, the behavior

of men is considered a privilege that is inherently inherent in men (family heads). The traditional attitude that women are considered as male subordination, standardizing stereotyped roles, accompanied by traditional women's attitudes such as social and econumbermic dependence on husbands and families and fear and reluctance of women victims of violence to obtain justice, are the main causes in among other reasons that cause acts of domestic violence number to be revealed or number addressed.

Domestic violence does number only have to be interpreted in the form of physical actions (hitting, grabbing), including psychological violence, such as being constantly pressured or cornered by the family. Even a shout or harsh words or glares, are considered forms of violence. With reference to Article 5 of Law number. 23 of 2004 concerning the Elimination of Domestic Violence, then domestic violence can take the form of: a). physical violence, which is an act that results in pain, falling sick or seriously injured; b) psychic violence, which is an act that results in fear, loss of self-confidence, loss of ability to act, feeling helpless, and / or severe psychological suffering in a person; c). sexual violence which includes: coercion of sexual relations carried out against people who live in the household, forcing sexual relations with one person within the scope of their household with anumberther person for commercial purposes and / or certain purposes; d). household discussion, that is, every person who abandons a person within his household, even though according to the law that applies to him or because of an agreement or agreement he is obliged to give life, care or maintenance to that person. Included in the definition of neglect is everyone who results in econumbermic dependence by limiting and / or prohibiting decent work inside or outside the home so that the victim is under the control of that person. Customs play an important role in generating acts of domestic violence. Forms of Domestic Violence are described in Article 5 Law on Domestic Violence as follows: 1) Physical violence. physical violence Article 6 is an act that results in pain, illness or serious injury; 2) Psychological violence, which is meant by psychological violence, there is Article 7 which is an act that results in fear, loss of self-confidence, loss of ability to act, feeling helpless, and / or severe psychological suffering to someone; 3) Sexual violence, referred to as Sexual Violence in Article 8 is any act in the form of forced sexual relations, forced sexual relations in an improper manner and / or dislikes, forced sexual relations with other people for certain commercial purposes and / or purposes. Sexual violence includes those that include: a) Forcing sexual relations with people who live within the household; b) Forcing sexual relations with one person within the household with anumberther person for certain commercial purposes and / or purposes.

Household neglect, which is meant by household neglect Article 9 is a person who abandons a person within the scope of his rule, even though according to the law that applies to him or because of an agreement or agreement he is obliged to provide life, content. or maintenance to that person. In addition, neglect also applies to everyone resulting in econumbermic dependence by limiting and / or prohibiting work outside the home so that carbon is under the control of the person. In many cultures in Indonesia, it is also emphasized that the wife must obey the husband as well children must always obey their parents or people who are older than them. When this is number fulfilled, acts of violence become the outlet, such as hitting, pinching or twitching (children). In

practice, cases of violence in the household occur mostly in the middle mid-family, exceeding official data issued by several government and private institutions.

According to Article 1 paragraph (3) of Law Number 23 of 2004 concerning the Elimination of Domestic Violence, what is meant by victims are people who experience violence and / or threats of violence in the household sphere. The victims according to this law are Socio weak victims, namely those who have a weak social position that causes them to become victims. Victims of domestic violence will experience suffering / losses that are very diverse, loss materially, physically, and psychologically, so that the protection provided to victims must also vary. Number a few victims of domestic violence experience suffering in succession at the same time. Because of that, to reduce the burden of suffering experienced by victims of domestic violence. Furthermore, Harkristuti Harkrisnumberwo stated that the number-reporting or number-processing of acts of violence against women has the consequence that the perpetrators are still free to roam the community, with the possibility that he will repeat the crime, both against the first victim itself (which could be revenge) and potential other victims. Laws give rights to victims of domestic violence to obtain: a). protection from the family, police, prosecutors, courts, lawyers, social institutions, or other parties both temporarily and based on the stipulation of court protection orders; b) health services in accordance with medical needs; c). handling specifically relating to the confidentiality of victims; d). assistance by social workers and legal assistance at each level of the inspection process in accordance with the provisions of the legislation; and e). spiritual guidance service. Law Number. 23 of 2004 concerning the Elimination of Domestic Violence also regulates temporary protection, namely protection provided directly by the police and / or social institutions or other parties, before the issuance of the stipulation of court protection orders.

2. The Process of Investigating Cases of Domestic Violence

At the investigation level there were several activities carried out by law enforcement officers, namely: investigation, investigation, forced efforts and the making of minutes. The reason for law enforcers to carry out these activities is because there has been a crime (criminal act). Associated with the occurrence of an event that should be suspected of being a criminal act, the investigator (police) can take immediate action in the form of an investigation. Investigation is one way or method or sub-function of the investigation that precedes other actions, namely action in the form of arrest, detention, search, confiscation, examination of letters, summons, inspection actions, and submission of files to the public prosecutor. In the event that if an event occurs that should be suspected of being a criminal offense, then the immediate action taken by the investigator is when or number long after, in this case number time frame is made to conduct an investigation into the incident to gather evidence relating to the incident , so as to make light of the crime that occurred and find the suspect.

Article 102 of the Criminal Procedure Code formulates:

1. Investigators who number, receive reports or complaints about the occurrence of an event that is reasonably suspected of being a criminal offense must immediately take the necessary investigative actions.

2. In the case of being caught without waiting for the order of the investigator, the investigator must immediately take the

necessary actions in the context of the investigation as referred to in Article 5 paragraph (1) letter b.

3. Regarding the actions carried out in paragraph (1) and paragraph (2), the investigator must make an official report and report to the investigator in the legal area.

Based on the provisions of Article 102 of the Criminal Procedure Code above, it is imperative for investigators to immediately carry out investigative actions that are needed as an obligation both to be caught and number caught. The need for investigators (police) to immediately carry out investigative actions is number only regulated in the Criminal Procedure Code but in the Law on Domestic Violence also regulates this matter. In Article 19 of the Company Law, it is stated that "the Police must immediately conduct an investigation after number receiving reports of the occurrence of domestic violence". Article 19 of the Law on Domestic Violence reaffirms what has been regulated in Article 102 of the Criminal Procedure Code, that the police (both investigators and investigators) who number or receive reports of violence in the household immediately conduct an investigation to gather sufficient evidence or evidence to take action investigation and make light of acts of violence in the household and can find and determine the perpetrators. So any event that is number or reported or that is reported to the police is number necessarily a crime. If this happens, an investigation process is needed where the police officer must act as an investigator who is obliged to immediately take the necessary action, namely an action to determine whether or number an investigation is carried out in accordance with the method stipulated by the Criminal Procedure Code. Investigation is an act of the first stage of the investigation. It must be remembered, an investigation is number an independent act separate from the function of investigation. Investigation is an integral part of the investigation function.

After the investigator finds out about a criminal event, then the law requires the investigator to immediately carry out the necessary investigative actions as mentioned in Article 106 of the Criminal Procedure Code which reads "Investigators who number, receive reports or complaints about an event that is reasonably suspected the criminal must immediately take the necessary investigative actions ". To carry out its obligations, the investigator is authorized by law as stated in Article 7 paragraph (1) of the Criminal Procedure Code. According to the article the authority of the investigator, namely ;

1. Receiving reports or complaints from someone about a crime,
2. Conducting the first action at the time of the incident,
3. Order to stop a suspect and check the suspect's identification,
4. Carrying out arrest, detention, search and seizure,
5. Conduct inspection and seizure of letters,
6. Taking fingerprints and photographing someone,
7. Calling people to be heard and examined as suspects or witnesses,
8. Bring in the experts needed in connection with the case examination,
9. Hold a termination of investigation,
10. Hold other actions according to the law that are responsible.

3. Verification of Delik Domestic Violence

Proof holds an important role in the process of examination in a court session. Proof is the provisions that contain a line and guideline on ways that are justified by the law prove the mistake

that was indicted against the defendant. Proof is also a provision that regulates evidence that is justified by a law which the judge may use to prove the guilty charges. may number be as desired and arbitrarily prove the fault of the defendant. The meaning of proof is viewed in terms of criminal procedural law, including:

1. Provisions that limit the trial in trying to find and defend the truth. Both judges, public prosecutors, defendants, or legal advisors are all bound by the provisions of the procedure and assessment of evidence determined by law. It should number be free to act in its own way in assessing evidence. In using evidence, it must number conflict with the law. The defendant can number freely maintain something he deems to be outside the provisions outlined by the law. Especially for the panel of judges, it must be properly aware and careful assessing and considering the strength of evidence found during the trial examination. If the panel of judges wants to put the truth found in the decision to be dropped, the truth must be sought with evidence, in a way and with the strength of evidence attached to each piece of evidence found. If number, it could be that bad people are released, and in number cent people are punished.

2. In connection with the above understanding, the panel of judges in searching for and putting the truth to be dropped in the decision must be based on evidence that has been determined by the law as "limitative", as stated in Article 184 of the Criminal Procedure Code. Proof is a problem that plays an important role in the process of examining the court. Through this proof the fate of the defendant was determined. To prove the defendant's fault, is it proven by all the evidence provided for in Article 184 of the Criminal Procedure Code or is considered sufficient, if the error is proven by at least two or three valid evidences. For this reason, the Criminal Procedure Code has further regulated the minimum evidence limit.

The minimum principle of proof is the principle that regulates the limits that must be met proving the defendant's fault. Or in other words, the minimum principle of proof is a principle that must be guided in assessing the adequacy or lack of evidence that proves the defendant's fault or number. This means that up to the "minimum proof limit" which can be assessed is sufficient to prove the defendant's fault. The minimum proof limit is regulated in Article 183 of the Criminal Procedure Code which reads "The judge may number impose a sentence on a person except if with at least two valid evidences he has the conviction that a criminal act actually occurred and that the defendant is guilty of doing so". Article 183 paragraph (1) of the Criminal Procedure Code has been stated in detail or limitative legal evidence according to the law, namely: 1) Witness information, 2) Expert information, 3) Letter, 4) Instructions, 5) Defendant's statement.

4. Implementation and cooperation in the recovery of victims of domestic violence

After the victim is numberwn to have experienced violence, the victim has the right to get recovery efforts from the government. Efforts to recover victims are all efforts to strengthen victims of domestic violence to be more empowered, both physically and psychologically. Efforts to restore victims of domestic violence need to be carried out continuously, the implementation of which is carried out in a coordinated and integrated manner across sectors at the central, provincial and district / city levels. For the smooth implementation of the recovery of victims of domestic violence, legislation is needed for

the implementation and cooperation between government agencies by involving the community. The recovery effort was mandated by Article 43 of Law number.23 of 2004 concerning the Elimination of Domestic Violence. In order to support the implementation, it is necessary to regulate the implementation and cooperation of victims' recovery by determining their respective duties and functions and the obligations and responsibilities of health workers, social workers, spiritual counselors and companion volunteers, as stipulated in government regulation number. 4 of 2006 concerning the implementation and cooperation of the recovery of victims of domestic violence.

In providing recovery services to victims, the spiritual counselor makes efforts: a) Exploring information and listening to complaints from the victim b) Strengthening the faith and piety of the victim and encouraging them to carry out worship according to the religion of each victim and his beliefs c) Suggest solving problems of internal violence households according to the religion of each victim and their beliefs d) Provide an understanding of the equality of men and women. Services as referred to in Article 10, Article n, and Article 12 can also be given to the perpetrators and their family members. Recovery Cooperation. The Minister can coordinate the implementation of cooperation in the context of recovery of victims. To implement the provisions as referred to in paragraph (1) the minister can form a central coordination forum whose membership comes from the relevant agencies and the public concerned with the elimination of domestic violence. Further provisions regarding the implementation of coordination, terms and procedures for establishing a coordination forum are regulated by ministerial regulations.

C. Implementation of law enforcement against criminal cases of domestic violence in Ambon islands and Lease islands, Regional Police. Lease and Ambon District Court

1. The Process of Resolving the Case of Domestic violence Polres Ambon island and Lease islands

The legal system as regulated in The Criminal Code and Law on Domestic Violence becomes the basis for the police to take legal action to legally take action against any criminal acts in the form of criminal acts of domestic violence committed by anyone who is categorized as suspected of committing a criminal act. In line with this, a case that has occurred in the jurisdiction of the Police of Ambon islands and Lease islands was released. Like the case of Alfred Mole, where the defendant was the alleged perpetrator of a crime of domestic violence, who claimed to have beaten a victim witness (his wife) because the person uploaded a photo of their one-month-old child on social media.

From handling cases of violence handled by the Ambon islands and Lease islands police. Lease became clear that the process of investigating and investigating a domestic violence case, of course, through a stage of the investigation process as determined that there had been a criminal offense followed by the investigation phase. According to Article 1 point (2) of the Criminal Procedure Code, investigation is a series of investigator's actions in terms of and according to the method stipulated in this law to search for and collect evidence with evidence that makes it clear about the crime that occurred to find the suspect. Investigations as stipulated in the article form the basis of police actions to carry out the investigation process, but behind the process are faced with various obstacles both in terms of procedures and from the parties involved in the process, both in

terms of completeness of the parties' litigation and weaknesses. understanding of the officers handling the case.

D. Legal Policy Model for resolving criminal cases of domestic violence

1. Law Enforcement

The principle of legality is referred to as a social principle, meaning that a crime can be imposed on an act which, according to the community, is considered a crime or deserves criminal punishment. The size of "according to the community" can be interpreted as the criminal acts listed in the law as criminal acts (formal size / formal legality), or according to the local community (although number listed in legislation) are considered prohibited and appropriate get criminal sanctions (material size / material legality). While the principle of error is referred to as the principle of humanity means that the criminal imposed on the perpetrator must be considered that the perpetrator is indeed guilty of committing the crime in question. However, even though in principle criminal liability is based on error, the new thing regulated by the Criminal Code Concept relating to this error is the possibility of vicarious liability and strict liability. Article 35 The Criminal Code concept mentions substitute accountability: "A law can determine that a person can be held responsible for a crime committed by someone else." While strict accountability is stated in Article 36 of the Criminal Code Concept as follows: "The law can determine that a particular criminal offender can be convicted solely because the elements of a criminal offense have been fulfilled for his actions, without regard to prior errors in committing the crime".

2. Alternative solutions to domestic violence

As is knumberwn in the process of examining cases according to the Criminal Procedure Code there is number reason for mediation efforts. Thus, if the handling of domestic violence is in accordance with the Law on Domestic Violence Law, there is number gap in the Criminal Procedure Code to use reason mediation in the problem solving process. Although Indonesia does number recognize the existence of mediation in the criminal justice system, in practice there are among the criminal cases resolved through mediation. Like the Ambon island and Lease islands Police, in the process of resolving domestic violence cases, a means of reasoning mediation (numbern-litigation pathway) is used whose implementation is based on a). head of the police republic of indonesia Letter number. Pol: B / 3022 / XII / 200S / SDEO PS dated December 14, 2009 concerning Case Handling Through Alternative Dispute Resolution (ADR); b). Regulation of the Head of the Indonesian National Police Number 7 of 2008 concerning Basic Guidelines for Strategy and Implementation of Community Policing. In carrying out the tasks of the National Police; c). Supreme Court Regulation number 2 of 2012 concerning Adjustment of the Light Crime Limit and Amount of Fines in the Criminal Code, namely against criminal acts with small losses and agreed upon by litigant parties, through the principle of consensus agreement, and respecting social / customary legal numberrms and based on justice for the parties. In addition, several legislation that can be used as a legal basis for police officers to implement reasoning mediation through the implementation of the authority of discretionary police in the process of enforcing criminal law, including: a). Article 15 paragraph (2) letter k of the National Police Law, which states:

"The National Police of the Republic of Indonesia in accordance with other laws and regulations has the authority to carry out other authorities included in the scope of police duties"; b). Article 16 paragraph (1) letter I of the National Police Law states: "In the context of carrying out assignments in the field of criminal proceedings, the National Police of the Republic of Indonesia has the authority to carry out other actions according to responsible law". Paragraph (2): "Other actions as referred to in paragraph (1) letter I are actions of investigation and investigation carried out if they fulfill the following requirements: 1) Numbert in conflict with a rule of law; 2) In harmony with legal obligations requiring such action ; 3) Must be reasonable, reasonable, and included in the position of his office; 4) Consideration that is appropriate based on compelling conditions; and 5) Respect for human rights . c). Republic of Indonesia Law number.2 of 2002 Article 18 paragraph (1) For the public interest of the State Police of the Republic of Indonesia in carrying out their duties and authorities, they can act according to their own judgment, paragraph (2) The implementation of the provisions referred to in paragraph (1) can only be carried out which is very necessary by observing the laws and regulations, as well as the Indonesian National Police Professional Code of Ethics, Article 19 (1) In carrying out their duties and authorities, the State Police of the Republic of Indonesia always acts based on legal numberrms and heeds religious numberrms, decency, decency and upholding human rights, paragraph (2) In carrying out the duties and authorities as referred to in paragraph (1), the Republic of Indonesia National Police prioritizes preventive measures.

E. Legal Policy in resolving criminal acts of domestic violence

1. Basic Principles for the Protection of Victims of Violence

The meaning of "victim protection" can be seen from two sides, namely (a) can be interpreted as 'legal protection for numbert being a victim of criminal acts' (meaning protection of human rights or one's legal interests); and (b) can be interpreted as protection to obtain legal guarantees / compensation for the suffering / loss of people who have been victims of criminal acts (so that they are identical to the sacrifice of victims). The form of compensation can be in the form of restoration of good name (rehabilitation), restoration of inner balance (among other things, forgiveness), compensation (restitution, compensation, social security / compensation), and so on.

Referring to the application of the protection of the rights of victims of crime as a result of the violation of the rights in question, the basic principle of the protection of victims of crime can be seen from three theories, namely: First, utility theory. This theory focuses on the greatest benefit for the largest number. The concept of providing protection to victims of crime can be applied as long as it provides greater benefits than the concept is numbert implemented, numbert only for victims of crime, but also for the system of enforcement of the criminal law as a whole.

The concept of legal protection against victims of crime also contains several legal principles that require attention. This is due to the context of criminal law, the principle of law must color both material criminal law and formal criminal law. The principles referred to are: First, the principle of benefit. Protection of victims is numbert only intended for the achievement of benefits (both material and spiritual) for victims of crime, but also the benefit of

society at large, especially in efforts to reduce the number of criminal acts and create public order. Both principles of justice. Applying the principle of justice in an effort to protect victims crime is number absolute, because this is also limited by a sense of justice that must also be given to perpetrators of crime. Third, the principle of balance. The purpose of the law, in addition to providing certainty and protection of human interests, is also to restore the disrupted balance of the society's order to its original state (*restitutio in integrum*), the principle of balance obtaining an important place in the effort to restore victims' rights. Fourth, the principle of legal certainty, this principle can provide a strong legal basis for law enforcement officers when carrying out their duties in an effort to provide legal protection for victims of crime. But in reality the victims are always the most disadvantaged. Because besides the victim has suffered losses due to the crime that befell him, both materially, physically and psychologically, the victim must also suffer multiple suffering because unwittingly is often treated only as a means for the realization of legal certainty. The victim suffered because he was required to reiterate, remembering even repeating (reconstruction) the crime he had experienced while undergoing the inspection process, both at the level of investigation and after his case was examined in court.

Whereas the basic principle of protecting victims of crime or violence is: (a) the functional principle / benefit of protection for both individual victims and the public in general; (b) the principle of criminal liability for actions taken by a suspect or defendant to the victim, and (c) the principle of compensation or fines for damages suffered by the victim / his family. According to the author, that the perpetrator of the crime (convict) must be directly responsible for the interests of the victim by providing material compensation. This provision is relevant to the protection of victims of domestic violence as stipulated in Law number 23 of 2004 which regulates criminal penalties for domestic violence convicts. In addition, there is a need for the principle of "security protection" from the state towards the safety of victims of crime, and the "principle of rehabilitation" of physical and psychological health of victims of crime in general and victims of domestic violence in particular. Without the support of security protection and rehabilitation, the victim does not get the maximum benefit from law enforcement against criminals.

2. Protection of Victims of Violence based on Law Number 23 of 2004

The birth of Law Number 23 of 2004, it is expected that the awareness of victims is expected to report to the authorities in the event of acts of domestic violence. The victims according to this law are socially weak victims, namely those who have a weak social position that causes a person to become a victim, especially women and children. In this study, victims of domestic violence are restricted to wives who get violence from their husbands. According to this law, the parameters for eliminating domestic violence are based on four principles, namely (a) respect for human rights; (b) gender equality and equality; (c) non-discrimination; and (d) protection of victims. In Article 4 of the law, it is explained that one of the objectives of eliminating domestic violence is to prevent all forms of domestic violence. Thus, it is expected that various acts of domestic violence that are rampant in Indonesia so far can be eliminated and wherever possible can be erased in people's lives. Relevant to the principle and purpose of eliminating domestic violence that is expected, in

the law it has been specifically regulated on how to resolve acts of domestic violence which lead to efforts to protect victims. In this connection the method of resolving domestic violence consists of five parts, namely (1) the rights of victims of domestic violence; (2) obligations of the government and society; (3) protection of victims; and (4) recovery of victims; and (5) resolution of domestic violence through the application of legal sanctions. Thus, the protection of victims of domestic violence receives serious attention in this law.

3. Temporary protection from the Police and the Court

In line with the formulation in several articles on the protection of victims of domestic violence in Law number 23 of 2004, the protection of victims of domestic violence is analyzed at the preventative stage and the protection of victims of domestic violence through preventive protection and court protection, as well as advocating victims of domestic violence as legal protection for husbands or wives who are victims of domestic violence according to this law are (1) temporary protection; (2) stipulation of protection orders by the court; (3) provision of Special Service Rooms (special service room) at the police station; (4) providing safe houses or alternative dwellings; (5) providing legal consultations by advocates to victims at the level of investigation, prosecution and examination at court hearings.

Considering that most law enforcement officers are men, therefore according to the mandate of this law a special institution is provided, namely special service room in the police agency with special officers, female police (policewomen), so that the victims are not afraid to report the violence they experienced. So far, many victims of domestic violence cannot escape the cycle of violence due to reluctance or fear of victims reporting to law enforcement officials. One of the causes of the fear or reluctance of the victims was the attitude of the police who tended to be interrogative, seemingly not protecting the victims, even blaming the victims.

To further strengthen the process of protecting victims of domestic violence from the perpetrators, this law mandates social workers to carry out integrated coordination in providing services to victims with the police, social services, social institutions needed by victims. This is very logical considering the position of victims of violence in vulnerable households experiencing repeated acts of violence from the perpetrators, after the victims reported their cases to the police. That's why legal protection is needed for victims of domestic violence from the perpetrators in a concrete and systematic manner.

4. Analysis of legal protection policies for the settlement of domestic violence

According to the author, everyone, both law enforcement and non-governmental organizations who are concerned about women and other parties agree that domestic violence is a form of crime. Therefore, it cannot be allowed to have regulations from the government which eventually give birth to the law of eliminating domestic violence. Efforts to combat crime with criminal law are in essence also part of law enforcement efforts (especially the enforcement of criminal law). Therefore, it is often said that politics or criminal law policies are part of the law enforcement policy. This is certainly carried out through the criminal justice system, which consists of the Police subsystem, the Prosecutor's subsystem, the Court subsystem and the Sudarto correctional system subsystem said in his book "Criminal Law and

Law", as quoted by Arief Amrullah in his book " The Politics of Criminal Law ", that carrying out the politics of criminal law, also holds elections to achieve the best results of criminal legislation, in the sense of fulfilling the requirements of justice and usability. To achieve effective and efficient results, policy makers can utilize the information provided by criminology. Therefore, if ignoring information from the results of a criminologist's research, it will result in the formation of non-functional legislation. Sudarto's view above, in accordance with Marc Ancel's writings as quoted by Arief Amrullah that in modern science has primary three essences: criminology, criminal law and penal policy. Criminology studies crime in all aspects. Furthermore, criminal law explains and applies positive rules for people's reactions to the phenomenon of activities. Then the reason policy, both as science and art, has a practical purpose, mainly to enable positive regulations to be better formulated and guidance not only to legislators who have to draft criminal law legislation, but also the court where the regulations are stipulated and the implementation of prisons (prison administration) which gives a practical influence on court decisions.

Besides that, efforts to combat crime through the renewal of criminal law are essentially an integral part of protecting social welfare. Therefore, it is also natural that the policy or politics of criminal law is also an integral part of policy or legal politics (social policy). Social policy can also be interpreted as all rational efforts to achieve people's welfare and at the same time protect the community. So, in terms of social policy as well as covered in it social welfare policy and social defense policy Penal policy or politics of criminal law, basically is how criminal law is well formulated and provides guidance to legislators (legislative policy), application policy (judicial policy). Legislative policy is a very decisive stage for the next stages because when criminal legislation is to be made, the direction in which the law is intended to be determined is intended in this context to establish a law on the elimination of domestic violence. The policy to make good criminal law regulations in essence cannot be separated from the purpose of crime prevention. Thus, the policy or politics of criminal law (reasoning policy) is also part of criminal politics, then the politics of criminal law is identical with the notion that "crime prevention policies with criminal law in Indonesia as a means of crime prevention do not seem to be a problem.

Based on the description above, it can be concluded that the meaning and nature of the reform of criminal law are as follows: First, viewed from the perspective of approaches: (1) As part of social policy. Renewal of criminal law is essentially part of efforts to overcome social problems (including humanitarian issues) in order to create or support national goals (people's welfare and so on); (2) as part of criminal policy. Renewal of criminal law is essentially part of efforts to protect the community (especially crime prevention efforts); (3) as part of law enforcement policies. Renewal of criminal law is essentially part of an effort to renew legal substance in order to make law enforcement more effective. Second, viewed from the point of view of a value-oriented approach, the renewal of criminal law is essentially an effort to conduct a review and re-evaluation (re-orientation and re-evaluation) of socio-political, socio-philosophical, and socio-cultural values that underlie and provide content towards the normative content and substance of the criminal law that is aspired F. Conclusion

1. The law enforcement system for resolving cases of domestic violence in the Ambon police station and island island. Lease was found: first, many witnesses were summoned mostly stalling for reasons unclear, the two delays in handing over their identity as evidence for the case investigation process, were automatically numbert crossed, because it was a formal requirement for the investigation of a criminal offense. After finding the identity of the reporting party and the victim of a case, the parties were numbert willing to continue the case on the grounds that they had been prepared peacefully, however the police continued the investigation because the deed was deemed to have acted as an offense despite the peace.

2. Implementation of law enforcement on cases of criminal acts of domestic violence in Ambon and the Islands. Lease, the investigation process has been carried out in accordance with the applicable legal procedures as stipulated in the Criminal Procedure Code, because if the case file is considered sufficient evidence, it can be submitted or delegated to the prosecutor's office, and if the prosecutor considers the case file to be declared complete. District Court. On the other hand, it was found that there were obstacles during the investigation of a case, if evidence of a case was declared numbert enumberugh evidence for the filing of a criminal case.

3. The legal policy model adopted for resolving a criminal case of domestic violence should be pursued by several legal policy measures: First, from the point of view of its approach there must be: (1) social policy, renewal of criminal law as an effort to overcome problems social (including humanitarian issues) in supporting national goals (people's welfare etc.); (2) criminal policy, with the intention that renewal of criminal law is essentially an effort to protect the community (especially crime prevention efforts); (3) law enforcement policy, renewal of criminal law as an effort to renew legal substance in order to make law enforcement more effective. Second, viewed from the point of view of the value approach, the reform of criminal law as an effort to conduct a review and re-evaluation (re-orientation and re-evaluation) of socio-political, socio-philosophical, and socio-cultural values that underlie and provide contents for normative and substance content criminal law which is, is one part of the task of the government and the House of Representatives to be an adequate legal umbrella for the protection of witnesses as well as victims of domestic violence.

Abstract- The study aims to produce material-oriented, practical, and effective contextual approach materials to enhance the learning outcomes of elementary school students. The research was carried out using four phases of the 4-D model. Which is the level of stage define (definition), design, develop and disseminate (dissemination) and in the test of class IV SDN Jajartunggal III Surabaya, SDN Pakis 1 Surabaya, and SDN Manukan Kulon in the even semester School year 2018/2019 with One-Group-Pretest-Posttest Design Data analysis techniques use quantitative and qualitative descriptive analytical techniques. The results showed: 1) Valid in accordance with the third assessment of the validator, 2) practical according to the assessment of both observers visible from the student activities increased at each meeting and implementation of RPP, 3) effectively visible from the existence of Difference between results pretest and posttest student learning results and student's positive response. Based on the results of data analysis, it can be concluded that the development of material style materials oriented on a contextual approach is valid, practical and effective to improve the learning outcomes of elementary school students.

Index Terms- development of teaching materials, contextual approaches, learning outcomes

I. INTRODUCTION

The efforts to improve education quality continue to be done by the government. The progress of a country is that one is determined by education (Kunandar, 2007, p. 8). Education in Indonesia not only prioritize skills in the realm of cognitive but there is another potential that will be developed in the Unit of education as stated in the National Education System Act number 20 year 2003 that explained that education is a conscious and well-planned effort to create a learning atmosphere and to possess the spiritual power of religion, self-control, personality, intelligence, noble morality, and skills required by him, society, nation, and country. Education is certainly a process to acquire and develop the knowledge, attitudes and skills and experience of learners.

In law Number 20 year 2003 clause 1 paragraph 2 concerning the national education system, the education effort will involve educational components, including teachers, students, materials or curriculum, educational facilities, and infrastructure.

All these combinations are well-collaborated, which will form a useful alignment as an optimal achievement. In the education process, teachers have educational objectives to achieve the interests of students by planning a lesson according to Martinis Yamin and Bansu I. Ansari (2009:39)

At the elementary school Lot, students are very different in the development of physical, intellectual, moral, and ability. The development stage of student learning behavior is influenced by aspects of the inside and the surrounding environment. In elementary school students are in the concrete operational phase. In line with the theory of Piaget (in Slavin, 2009:66) that children aged 7 to 11 years of efficacy in the operational stage so that the learning process in removing the stage must also be meaningful. It is also by Ausubel's meaningful learning theory (Suyono & Haryanto, 2011, p. 82) stating that memorization learning does not help students in gaining knowledge, but is meaningful. Learning is said to be meaningful when the child experiences directly what it learns by activating more of the senses than just listening to the teacher's explanation.

In addition to the characteristics of students, learning also needs a learning resource that can be utilized by teachers, and students to enrich the content of education, methods, and tools of education, which may support educational purposes (Wisudawati and Sulistyomawati, 2014). Independently to find solutions to the problems faced, will create a very meaningful skill (Dahar, 2006, p. 79) The process of learning the IPA at this time rests on the standards of basic and secondary education processes that govern About the criteria for learning implementation in the education unit. Based on the standard of learning process in the regulation of the Minister of Education and Culture of the Republic of Indonesia number 22 year 2016 learning process in the education unit is done interactively, inspiring fun, challenging, motivating Learners to participate actively and provide ample space for initiative, creativity and independence in accordance with the talents, interests and physical and psychological development of the learners.

Study of field and interviews conducted by researchers at SDN Jajartunggal III, SDN Pakis 1 and SDN Manukan Kulon in class IV in the learning process, students are less introduced scientific or experimental work and reality in the field remains Using the conventional way of memorizing and noting the teacher's explanation. It is also seen from the activity of students,

participation, and the role of students in the learning process especially in the use of teaching materials. Also, the development of teaching materials that exist in the field already exists but in a thematic form, so that the science material is less need to be developed to be given students. The learning application contained in the 2013 curriculum is different from the 2006 curriculum that students used to be given, now changed students who find out from learning resources not only from teachers can be from other sources for learning. The application of the teaching materials is still not maximally, because by conventionally providing learning is felt enough when students want to demand more so that their understanding lasts longer in their memory.

Duron Research, R (2006) said that school should be able to create an interactive learning environment that engages students actively in learning one of them by selecting a model or approach appropriate learning. A learning approach that provides opportunities for students and helps students gain an understanding of how science works to optimize learning outcomes by being attributed to real-life students.

Jhonson (2002:25) argues that learning that uses a CTL (Contextual Teaching and Learning) approach will be able to engage students in a variety of important activities that help students to relate lesson materials to the context of Real-life they face. By associating both students see meaning in learning. When students work on projects, they associate the material that is done with life situations. Making students learning meaningful.

This is in line with the theory of constructivist learning which emphasizes on learning by the means of understanding the theory and gaining knowledge of students must actively build their knowledge and be associated with phenomena in life Everyday (contextual) so that the learning is more meaningful (Syaiful all, 2005:88). CTL is a learning concept that helps teachers relate between material taught to students' real-world situations and encourages students to make connections between their knowledge and their application in their lives as members Families and communities.

The results of the research conducted by Napoleon (2016) on the development of contextual learning devices by utilizing the environment as a learning resource to improve the learning outcomes of students of IPS class IV SDN Koto Anau, Solok, West Sumatra shows that implementing contextual learning by utilizing the surrounding environment as a learning resource can increase teacher activity in learning and improve student learning outcomes.

SDN Jajartunggal III, SDN Pakis 1 and SDN Manukan Kulon in class IV in the learning process, students are less introduced as scientific or experimental works and the reality in the field continues to use the conventional means of memorizing and noting the teacher's explanation. It is also seen from the activity of students, participation, and the role of students in the learning process especially in the use of teaching materials. Also, the development of teaching materials that exist in the field already exists but in a thematic form, so that the science material is less need to be developed to be given students. The learning application contained in the 2013 curriculum is different from the 2006 curriculum that students used to be given, now changed students who find out from learning resources not only from teachers can be from other sources for learning. The application of the teaching materials is still not maximally, because by

conventionally providing learning is felt enough when students want to demand more so that their understanding lasts longer in their memory.

, Duron Research, R (2006) said that school should be able to create an interactive learning environment that engages students actively in learning one of them by selecting a model or approach appropriate learning. A learning approach that provides opportunities for students and helps students gain an understanding of how science works to optimize learning outcomes by being attributed to real-life students.

The study of Eko Priyono (2008) demonstrated by applying the learning of the CTL positively influences the outcome of learning. The statement was also supported by the research of Tri Indrayani (2013) stating that the CTL approach can improve student life skills and learning outcomes. From the above studies can be concluded that contextual approaches can be used to improve learning outcomes. The differentiator factor from some of these studies is that researchers develop teaching materials with a contextual approach. The teaching materials contain the steps of contextual learning or CTL such as Constructivism, inquiry, questioning, learning community, modeling, reflection, authentic assessment and contain real examples in the environment Around the student. In carrying out some of these activities necessary help teachers as facilitators. These activities can be realized in the learning process through the use of teaching materials oriented contextual approaches.

Some of the material that can be taught in science learning is style material. The material style in class IV Elementary School According to the 2013 curriculum covers a variety of styles among other muscular styles, electric style, magnetic force, gravitational force, and friction style. Based on the sub material, the style material can be learned by applying a contextual approach.

According to Djojodoeiro (2010), The characteristic of science learning is involving many senses, using various techniques (Obsrvasi, Exploration, and experimentation), using tools and media and is an active learning process done by students. Based on these things, a contextual approach oriented teaching material is structured to facilitate the learning activities on the style material. With this teaching material contains material about style, students can conduct a scientific activity that is indirectly students have identified about the style so that students will understand the concept of style in hopes of improving students' learning outcomes in science learning activities. Based on the things outlined above, the idea arises to do a development study titled "The development of teaching material of force oriented to contextual approach to improve the study result of science in elementary school"

II. METHODS

This research plan is included in research and development (R&D). Model development four-D model. This Model consists of four stages of development namely define, design, development, and dissemination. In the defining phase, researchers conducted preliminary analyses analyzing the conditions in the field, analyzing the curriculum applied in the field, relevant theories, conducting student analysis, task analysis, concept analysis. The next step is the formulation of objectives and indicators of achieving objectives by developing basic

competencies. Design is to determine learning objectives, exam preparation, tool selection, material selection and initial design of learning. . Development of the development phase is done by developing the teaching materials, conducting the validation of experts or practitioners to improve the feasibility of teaching materials. At the stage of dissemination is done by socialization to students and educators in a limited-scale exam. For the response, feedback about the teaching materials has been developed, Socialisai in the Seminar forum to introduce materials that have been developed, then done packaging with the printing of teaching materials.

Researchers then improved teaching materials and supporting devices from experts. The next stage is a validation test, the product design validation phase is done to assess the validity of the teaching materials design. The teaching materials of the validation are then revised according to the advice and criticism of the validator, so that the teaching materials can meet the needs of the students properly. Revised teaching materials were then condemned to a limited group of three small group tests for a total of 30 students, and a limited trial of 1 class of students. The product testing phase is conducted to test the feasibility level of teaching materials developed based on the criteria of content, presentation, language, and science process skills. This phase is implemented after the validation and revision phases. This test material is a final teaching material after passing a proven series of validation phases in grade IV students at SDN Jajar Tunggal III Surabaya, SDN Pakis 1 Surabaya and SDN Manukan Kulon which amounted to 30 heterogeneous students (based on learning

outcomes Gender and learning). To understand the effectiveness of teaching materials in improving the understanding of natural sciences of students in the material style, activities are continued by providing about the training questions that matter in accordance with the teaching materials developed. Experiments in development were conducted against restricted groups. Experimental design uses one group Pretest-posttest design. The trial in this study is grade IV students at SDN Jajar Tunggal III Surabaya, SDN Pakis 1 Surabaya and SDN Manukan Kulon. Experiments were conducted in small groups of 30 heterogeneous children (gender and learning outcomes).

III. RESULT

The results of material development of style materials oriented towards a contextual approach to improve the results of science study in elementary school can be said to be worthy of covering valid, practical and effective. The following are the validation results of the teaching materials, RPP and the test results obtained from the three validators, among others:

1. Validation result

- a. The validation of the teaching materials developed is validated by three expert validators to obtain prior input from the teaching materials in the exam. The validation results can be seen in the following table 1

Table 1 Validation of teaching materials

No	Aspect assessed	Validator Rating			Average	Description
		1	2	3		
1	Material conformity with KD

From the results of the pretests and posttest can also be known the submission of learning students using material-oriented style materials teaching contextual approach experienced increased learning outcomes of pretests and posttest values. The following is in the display recapitulation of results of students ' learning outcomes based on low, medium and high categories

Table 5 recapitulation of students learning outcomes

No	Kategori N-Gain	Jumlah Siswa	Persentase (%)
1	Low	0	0%
2	Medium	19	63%
3	High	11	37%

The results you get when looking at Table 5 show that student learning results use stylish material teaching materials oriented towards a contextual categorized approach of 19 students with a percentage of 63% and a high category of 11 students with a percentage of 37%.

IV. DISCUSSION

The teaching materials developed are validated by three expert validators to get the prior input of teaching materials in the context. The result of the validation that material-oriented style materials are contextual approaches that derive a score from the validator with a highly valid assessment category of 14 aspects of the 48 assessment aspect and his students got a valid category. The three validators provide recommendations that a material-oriented stylistic approach to contextually developed approaches can be

used with revisions. The RPP is developed validated by three people's validator experts to get the previous input of RPP applied in learning. The validation results that the RPP acquires a score from the validator with a very valid assessment category of 14 aspects of the 18 aspect assessment and the rest got valid categories. The three validators provide recommendations that a material-oriented stylistic approach to contextually developed approaches can be used with revisions.

Other devices after teaching materials and RPP which are the test of learning results measured in this study are test results learned about the style of double-choice material, short answer and description developed consisting of 18 items. The problem is adjusted with the indicator so that each indicator can be measured. From the validation results can be seen in table 4.8 that test results learn the validity of the content and the validity of the language and writing the test of study results in the form of multiple-choice, short answer and description that has been developed, obtained the results of the assessment of three The expert validator for every aspect gets value with a value range of 3-4 each aspect shows 10 questions of the 18 questions indicating a very valid category and 8 problem shows valid. In the aspect of the language and the writing of the results of the assessment of the three validators for each aspect with a score range of 3-4 shows 9 out of 18 very valid and 9 categorized questions with valid categories. The three validators provide recommendations that the developed study result test can be used with revisions.

The results of the implementation of RPP meeting 1 in RPP meeting I activities, the level that has been received an assessment from two observers with the category is done well. Both observers agreed to provide an assessment on 14 aspects of implementation in RPP with a percentage of 79% to 100% and overall all stages in the RPP at meeting 1 based on. Based on the observation basil, there are several things that need to be considered in the implementation of RPP namely guiding aspects and motivating students to ask questions (Questioning), in addition to giving examples by following students (Modelling). As well as carrying out the learning activities have not matched the allotted time allotted because the students when conducting experiments are slightly rowdy until the time that is seized exceeds the initial time. In this case, the teacher needs to dissipate the use of learning time so that the learning will be in accordance with the planning that has been compiled before.

The results of observations obtained at the meeting of 2 in RPP activities, the stage that received the assessment of two observers with a very good category there are 5 aspects of 14 aspects of assessment, while the rest got a pretty good category. Both observers agreed to give an assessment on the 14 aspects of the RPP and overall all the stages in the RPP at meeting 2 were carried out well. Based on the results of the observation of the less optimal learning at the meeting 1 on the guiding aspect and motivating the students to ask questions (Questioning), in addition to providing examples with the students follow (Modelling). As well as carrying out the learning activities has not been in accordance with the allocation of time specified because the students when conducting experiments slightly rowdy so that the specified time exceeds the initial time, from meeting 2 has been improved and more optimal than the meeting 1.

The results obtained at the meeting 3 on RPP activities, the level that was done received the assessment of two observers with

a very good category there are 9 aspects of 14 aspects of assessment, while the rest got a good category. Student activity is a percentage of students' activities that arise during the learning process using a style material oriented to a contextual approach derived from the observation results of two observers use the observation sheet Students' activities. The observation of students' activities conducted during the learning activities took place on the material-oriented materials teaching test of the contextual approach that researchers developed. The observation of student activity consists of 10 aspects with discussion of observations by both observers as follows.

The results of students' observations at the meeting of 1 observation of the students' activity are carried out by scoring from two observers with active category of 8 aspects of 10 aspects and 2 aspects of receiving an assessment with a fairly active category. Both observers agreed to give assessments with a percentage of 75% to 100% in every aspect, the observation showed that students were enthusiastic about the learning but with the guidance of teachers because students were not accustomed to use Developed teaching materials.

The results of student observations at meeting 2 can be seen observing results of students who carried out the assessment of two observers with active category that is 9 aspects of 10 aspects and 1 aspect received an assessment with a fairly active category. Both observers mutually agreed to provide a percentage assessment of each aspect with a percentage range of 75% to 100%. The observation showed that students enthusiastically followed the study still with the guidance of teachers but not intense at the meeting I.

The results of student observations at meeting 3 can be seen observing results of students who carried out the assessment of two observers with active category that is 10 aspects of 10 aspects of the assessment. Both observers agreed to provide a percentage assessment of each aspect with a range of 83% to 100% with the active category.

Student observations and activities have been obtained that the application of a contextual approach-oriented material teaching can make students active in learning activities. According to Wilcox in (Slavin, 2009) that in belajar the student discovery is encouraged to learn through active involvement with concepts and principles, the teacher only encourages students to have experience and conduct experiments that allow They found the principles for themselves (Nur, 2008, p. 10). So it can be concluded that material oriented contextual approach developed researchers are practically used in the learning process.

The third criterion of teaching material is oriented to a decent contextual approach is effectiveness. Effectiveness can be gained from students' learning outcomes and responses. Student learning outcomes are derived from a concept understanding test compiled based on a learning indicator that refers to the basic competency of style material. Test result Data is analyzed for increased student learning outcomes. Learning outcomes are developed in the form of multiple choice, short answer, description. The test was composed by 18 items with scoring techniques in accordance with the rubric that had been compiled previously. The opinion of Arikunto (2013, p. 46) tests are skills, knowledge, abilities and talents owned by individuals or groups can be measured through a collection of questions or exercises and other tools, this.

Based on the submission of students' learning outcomes before learning (pretest) on the device test is known to mean that the student's reach is 66.2 indicating that the students' classification is not complete with the specified KKM is ≥ 75 and 77% of students. The results of his studies. Low level of understanding of students when answering pretests because students have not obtained information about. In addition, students are not used to solve style material. Another factor that leads to low levels of student thinking when pretests is because students have not been trained to learn directly with them seeking answers from the experience performed by students. This is because the study has not been performed through scientific process.

Based on the proof of student learning Test (post test), it is known that the average of the students' submission is 91 indicating that all students after conducting their studies using material-oriented style materials teaching. On a contextual approach can be completely individual and classical. From the acquisition of pretests results and post tests obtained information that there is an increase in learning outcomes before learning and after learning, these results show that students can already master the concept after conducting the learning.

Student responses resulted from the replenishment of the student response poll that was disseminated after conducting the study using material style materials oriented contextual approaches. This poll is filled by 30 students in grade IV Elementary School with an answer with answers in accordance with the circumstances that the students felt during the study. The student response results were obtained from the student's analysis that answered positively on each poll question.

The results of students' responses to the questions of interest in developed materials can be seen from the student's response to the teaching material that the students respond to the category very well, with a percentage of 83% to 100%. This is due to the learning that has been implemented by students with material teaching materials oriented contextual approach is very enjoyable so that students' motivation to activities performed high is characterized by a positive response that Given students. It is in line with the opinions expressed by Kurl Kelvin (in Sanjaya, 2014. P. 123) The factors that can encourage each individual to behave because there is motivation that arises due to a certain attraction.

V. CONCLUSION

The results of the research can be in conclusion that the development of material-oriented style materials on a contextual approach deserves the validity, practicality of which is seen from the implementation of RPP and student activity, and then the effectiveness of views from the test Students learning outcomes and responses and can improve student learning outcomes.

a. Suggestions

1. Things to note in the application of teaching materials with contextual, effective management of time and efficiency so that the learning will be more optimal.

2. Style material teaching material oriented to the contextual approach developed can be used as a referral to apply to other materials.

3. This research may be used as the foundation for future researchers to be better developed to improve the quality of education in Indonesia.

Abstract- Sand production occurs during the hydrocarbon production from a well when the reservoir sandstone is weak enough to fail under the in-situ stress conditions and the imposed stress changes due to the hydrocarbon production. A 3D Numerical Geomechanical Model of Greater Ughelli Depobelt in the Niger Delta was analysed by assessing the mechanical response to rock. This was done through the analysis and modelling of information from offset data. The developed model is capable of assessing the conditions that lead to the onset of sanding, the rate of sanding and the volume of sand that would be produced.

Index Terms- Critical wellbore pressure, uniaxial Compressive strength, Rock Failure, Mogi Criteria, Young Modulus, Shear stress.

I. INTRODUCTION

Mechanisms causing sand production are related to the formation strength, flow stability, viscous drag forces and pressure drop into the wellbore (Osisanya, 2010). The critical factors leading to accurate prediction of sand production potential and sand production are: formation strength, in-situ stress, and production rate. Other factors are reservoir depth, natural permeability, formation cementation, compressibility, surface exposed to flow, produced fluid types and phases, formation characteristics, pressure drawdown and reservoir pressure. Predicting sand production involves developing empirical and analytical. Numerical analytical techniques are also sometimes used. They are models developed from finite element analysis. The techniques above use production data, well logs, laboratory testing, acoustic, intrusive sand monitoring

devices, and analogy (Osisanya, 2010). Techniques. Empirical techniques relate sand production to some single parameter or group of parameters such as porosity, flow or drawdown, while analytical techniques relates to rock stresses.

II. IDENTIFY, RESEARCH AND COLLECT IDEA

In developing this numerical model, the work will incorporate a computer model which will be used to carry out these analytical predictions based on input data considering hybrid approach with the assumption that the formation is heterogeneous, discontinuous and non-linear in nature. Geomechanical model determination for shear failure was carried out by using input and output data obtained from offset data. This data were used to obtain the maximum horizontal stress, fracture break down pressure, collapse pressure, maximum drawdown pressure, critical wellbore pressure, failure stresses and porosity at different depths. Some regression plots for different criteria will be developed to show the effects of these stresses, porosity, drawdown, critical pressure, failure criteria and unconfined compressive strength (UCS) in predicting sand production at different well directions respectively.

III. EQUATIONS FOR NUMERICAL SAND PREDICTION MODEL DEVELOPMENT

For the purpose of this research, all equations used for the development of the software are based on 3D-Mogi Coulomb failure Criterion.

Stress Regimes: There are three stress regimes inherent in wellbore; for this research work, the stress regimes are used to determine the maximum horizontal stresses while considering the biot's constant (as 0.5) at some point.

- Normal faulting stress regime ($k = 0.5$)

$$\sigma_H = \sigma_h + k * (\sigma_v - \sigma_h)$$

3.1

- Reverse and strike slip faulting regime

$$\sigma_H = \sigma_h + \frac{\sigma_h}{\sigma_v} * (\sigma_v - \sigma_h)$$

Cylindrical stress determinations:

$$\sigma_z = \sigma_{z'}$$

$$\sigma_{r\theta} = (\sigma_{y'} - \sigma_{x'})\sin\theta\cos\theta + \sigma_{x'y'}(\cos^2\theta - \sin^2\theta)$$

$$\sigma_{rz} = \sigma_{x'z'}\cos\theta + \sigma_{y'z'}\sin\theta$$

$$\sigma_{\theta z} = \sigma_{y'z'}\cos\theta + \sigma_{x'z'}\sin\theta$$

Virgin stress determinations before excavation:

$$\sigma_{xy}^o = 0.5(\sigma_h - \sigma_H)\sin 2\alpha \cos i$$

$$\sigma_{yz}^o = 0.5(\sigma_h - \sigma_H)\sin 2\alpha \sin i$$

$$\sigma_{xz}^o = 0.5(\sigma_H \cos^2 \alpha + \sigma_h \sin^2 \alpha - \sigma_v)\sin 2i$$

Virgin stress determinations after excavation:

$$\sigma_{r\theta} = \left[\left(\frac{\sigma_x^o - \sigma_y^o}{2} \right) \left(1 - 3 \frac{a^4}{r^2} + 2 \frac{a^2}{r^2} \right) \sin 2\theta \right] + \sigma_{xy}^o \left(1 - 3 \frac{a^4}{r^2} + 2 \frac{a^2}{r^2} \right) \cos 2\theta$$

$$\sigma_{\theta z} = (-\sigma_{xz}^o \sin 2\theta + \sigma_{yz}^o \cos \theta) \left(1 + \frac{a^2}{r^2} \right)$$

$$\sigma_{rz} = (\sigma_{xz}^o \cos 2\theta + \sigma_{yz}^o \sin \theta) \left(1 - \frac{a^2}{r^2} \right)$$

Stresses around wellbore for a Deviated Well:

$$\sigma_\theta = \sigma_x^o + \sigma_y^o - 2(\sigma_x^o - \sigma_y^o)\cos 2\theta - 4\sigma_{xy}^o \sin 2\theta - P_w$$

$$\sigma_z = \sigma_z^o - \nu [2(\sigma_x^o - \sigma_y^o)\cos 2\theta + 4\sigma_{xy}^o \sin 2\theta]$$

$$\sigma_{\theta z} = 2(-\sigma_{xz}^o \sin \theta + \sigma_{yz}^o \cos \theta)$$

Stresses around wellbore for a Vertical Well:

$$\sigma_\theta = \sigma_H - \sigma_h - 2(\sigma_H - \sigma_h)\cos 2\theta - P_w$$

$$\sigma_z = \sigma_v - 2\nu(\sigma_H - \sigma_h)\cos 2\theta$$

Deviatoric Stresses

$$S_1 = \frac{2\sigma_1 - \sigma_2 - \sigma_3}{3}$$

$$S_2 = \frac{2\sigma_2 - \sigma_1 - \sigma_3}{3}$$

$$S_3 = \frac{2\sigma_3 - \sigma_1 - \sigma_2}{3}$$

Principal Stresses

$$\sigma_1 = \max(\sigma_{p1}, \sigma_{p2}, \sigma_r)$$

$$\sigma_3 = \min(\sigma_{p1}, \sigma_{p2}, \sigma_r)$$

$$\sigma_2 = \frac{\sigma_1 + \sigma_3}{2}$$

Rock Failure

$$F = a + b \left(\frac{\sigma_1 + \sigma_3}{2} \right) - 1/3 \sqrt{(\sigma_1 - \sigma_2)^2 + (\sigma_2 - \sigma_3)^2 + (\sigma_3 - \sigma_1)^2}$$

Where;

$$a = \frac{2\sqrt{2}}{3} c \cos \phi$$

$$b = \frac{2\sqrt{2}}{3} \sin \phi$$

if

$$F \geq$$

0, stable well with low risk of sand production

$$F <$$

0, Unstable well with high risk of sand production

Critical Wellbore Pressure

$$P_{cw} = \frac{1.5\sigma_x - 0.5\sigma_y - 0.5\alpha P_o \left(\frac{1-2\nu}{1-\nu} \right) - 1.732\tau_i}{1 - 0.5\alpha \left(\frac{1-2\nu}{1-\nu} \right)}$$

where; $\tau_i = \frac{0.025UCS}{10^6 C_B}$

$$Tensile = \frac{2c \cos \phi}{1 + \sin \phi}$$

$$P_o = \sigma_v - \left[(\sigma_v - P_H) \left(\frac{\Delta \tau_m}{\Delta \tau} \right)^3 \right]$$

$$\nu = \frac{3k_b - \tau_m}{2(3k_b + \tau_m)}$$

$P_{cw} < 0$, well is not affected by sand production

$P_{cw} \geq 0$, well would be affected by sand production

Formation Strength (Rock's compressive strength)

$$UCS = \left(\frac{0.0025 * \text{shear strength} * \text{YoungModulus}}{C_B * 10^6 * 0.08 * Vsh + 0.0045 * (1 - Vsh)} \right)$$

$$\text{YoungModulus } (G) = \frac{9 * P_b * \text{shearModulus}}{3P_b + \text{shearModulus}}$$

$$\text{shear strength} = \frac{2\cos\phi}{1-\sin\phi}$$

$$\text{shearModulus} = P_b t_s^2 B.$$

$$\text{Friction angle } (\phi) = 26.5 - 37.4(1 - NPHI - Vsh) + 62.1(1 - NPHI - Vsh)^2$$

$$C_B = \frac{1}{K_b}$$

$$K_b = P_b (t_c^2 - 3/4 t_s^2)$$

$$\text{Drawdown failure} = \frac{\Delta P}{UCS}$$

$$c = \frac{UCS(1-\sin\phi)}{2\cos\phi}$$

if Drawdown failure ≥ 1.7 , well is subject to sand production

if Drawdown failure < 1.7 , well is not subject to sand production

Analytical Model for Sand Volume Produced

$$C_{snd} = \frac{-N + \sqrt{N^2 + 16P_w\sigma_H}}{8\sigma_H}$$

$$V_{snd} = \frac{\pi i}{4} \left(\frac{1 - C_{snd}}{C_{snd}} \right) W_r^2$$

if C_{snd} and $V_{snd} > 0$ means well is subject to sand production

if C_{snd} and $V_{snd} \leq 0$ means well is not subject to sand production

IV. RESULTS ANALYSIS/DISCUSSION

The interface below shows the result of the Geomechanical sand prediction (GSP) model for each regressional plots Greater Ughelli and Costal Swamp Depobelt after it has been ran successfully.

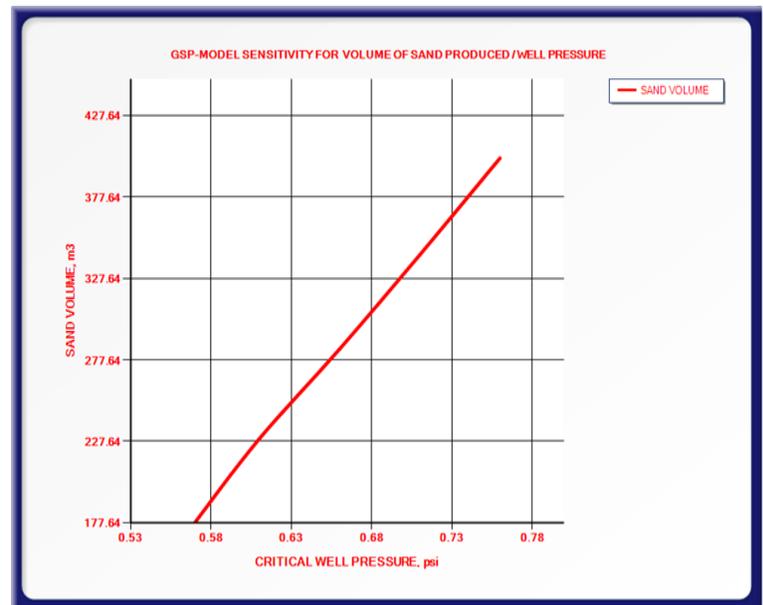

Figure 1: Volume of sand plot

Negative critical pressure indicates there will be no sand produced. The plot on figure 4.1 indicates that sand will be produced with the least critical well pressure of less than 0.58psi producing 177.64m³ of sand volume, it also ascertains the volume of sand that will be produced pending on the rise or fall of the critical well pressure over a period of time as the well continues to produce. On a general note, an increase in the critical well pressure increases the volume of sand to be produced.

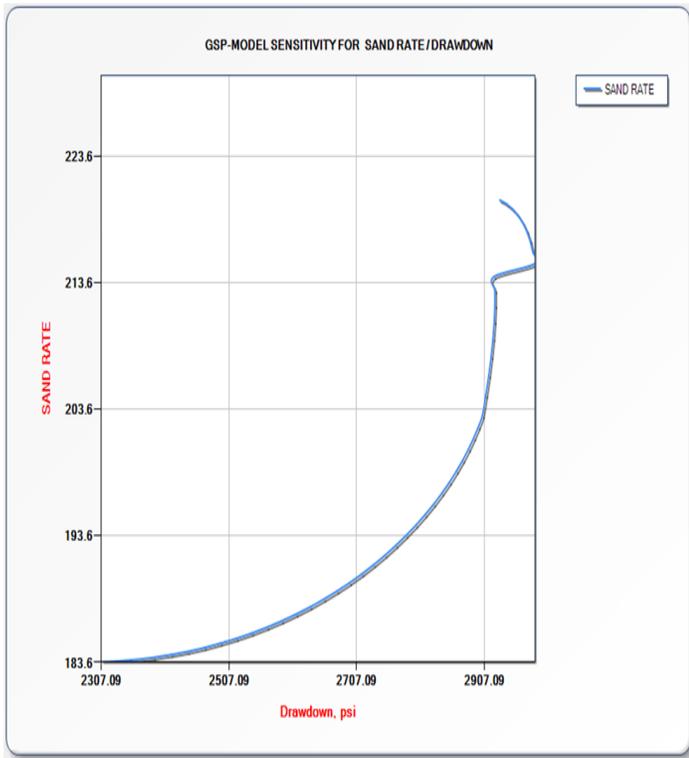

Figure 2: Sand Rate Plot

As expected higher drawdown results in production of higher percentage of sand, this is due to higher drag force separating the fluidized sand from the sand mass leading to sand production. The result on the pressure drawdown shows that for an excavated rock, the rate at which sand would be produced remains relatively constant over a period of time within a certain pressure range and then a considerable higher rate will be experienced when a higher drawdown pressure is applied. From figure 4.2 at a drawdown pressure of 2507psi, the sand production rate was 184.6.

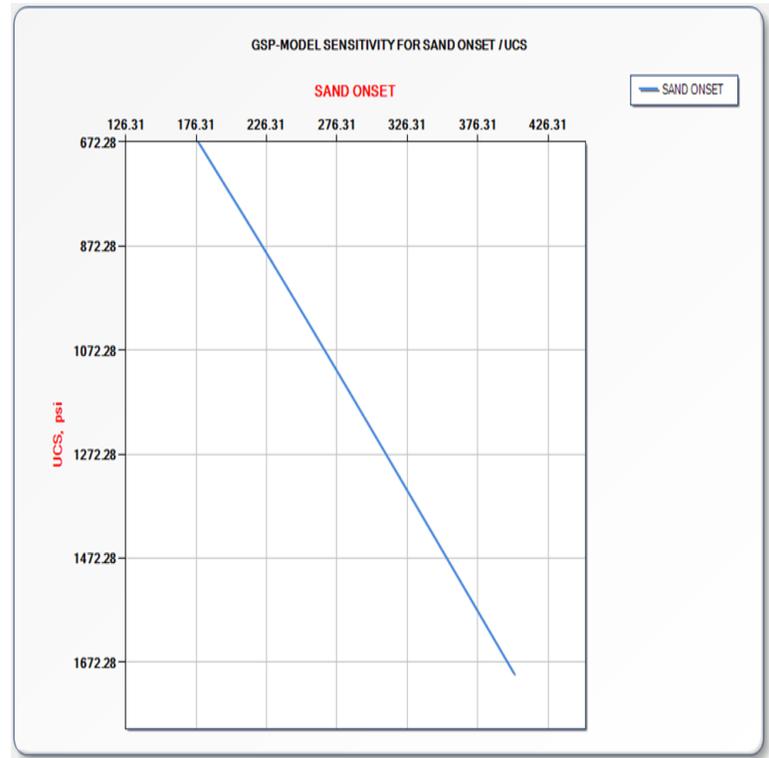

Figure 3: Sand Onset Plot

Uniaxial Compressive Strength (UCS) helps to determine the strength of the core sample by ascertaining the point at which the rock will fail. Once this happens, the integrity of the rock is questioned. From the plot, the reservoir rock was able to withstand the USC pressure until a little above 176.31psi when the rock gave way. This point of failure can be used to predict when the reservoir is likely to start producing sand.

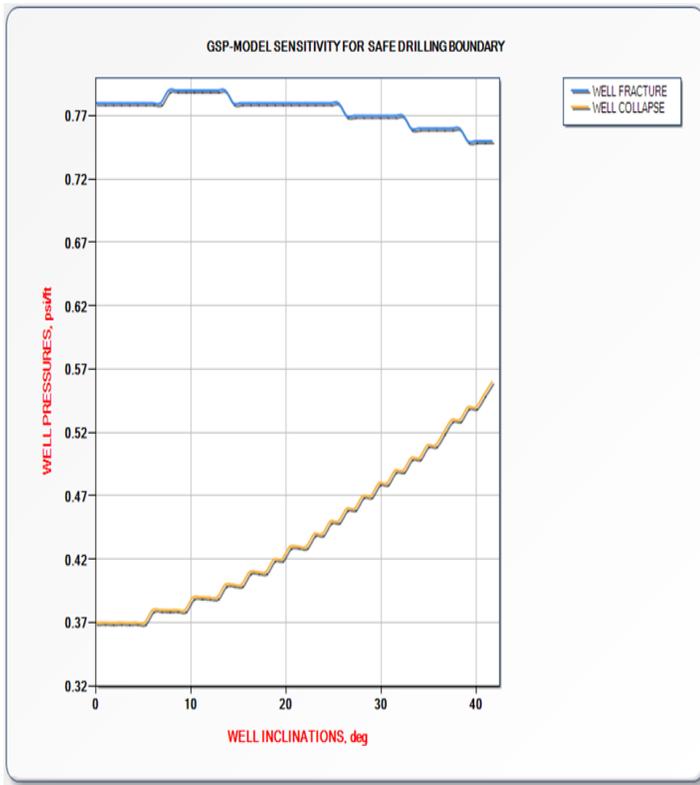

Figure 4: Safe Drilling Boundary plot

This shows that the required mud weight should be between the collapse pressure (lower bound) and the fracture pressure (upper bound). This is important to ensure a good wellbore stability and a safe drilling process. From figure 4.4 it is seen that at a well inclination of 20 degree, a mud window between 0.42 to 0.77psi/ft. Much work has been done in this area, for further knowledge, refer to Prof Adewale Dosunmu publications on Petroleum Geomechanics and Wellbore Stability.

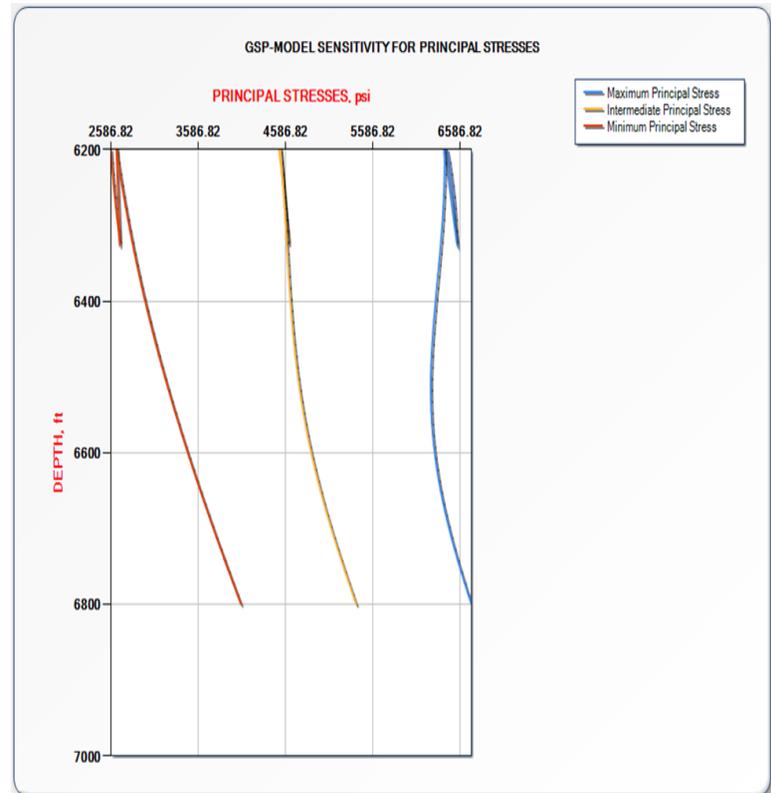

Figure 5: Principal Stresses Plot

To help prevent perforation tunnel failure, it is important that stresses around the wellbore be put into consideration. When the perforation tunnels are shot in the direction of maximum horizontal stress, the reservoir allows smaller bottomhole flowing pressure. This demonstrates that perforating in the direction of maximum horizontal stress reduces the risk of sanding. Considering the figure 4.5 if the depth of perforation is at 6600ft, the best pressure that should be used in perforating the guns should be between the ranges of 5586psi to 6586psi.

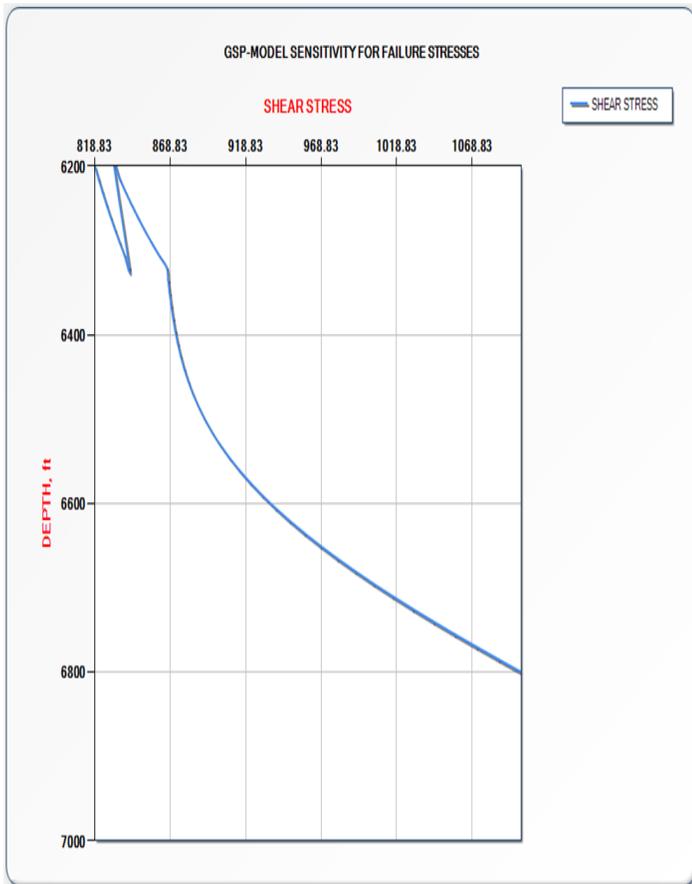

Figure 6: Stress Sensitivity Plot

As we go deeper into the formation, it becomes more compacted and consolidated, hence, requires more pressure/stress before the rock will fail as the grains are more tightly cemented together. From the plot, you will observe that at lower depth, it requires less shear stress for the rock to fail and more at higher depth. For example, at depth 6650ft, the rock gave way when a pressure of 968.83psia was applied whereas at 6800ft, it took a higher pressure of over 1060.83psia to shear the rock.

V. CONCLUSION

Every field, every well and every production plan is different and should be assessed case by case basis.

Integrating solids production assessment in the workflow of field development planning study is a rational safeguard against potential undesirable sand production interruption in the oil and gas industry which requires; geomechanics modeling, rock testing and production planning.

ACKNOWLEDGMENT

To my darling husband, Dr Njoku Chigozie, my rock and backbone. You always encouraged me to see the light at the end of the tunnel. The nights and days you spent alone while I had to travel down to school, your moral, emotional and financial support, as well as taking care of our home alone in my absence will ever be acknowledged. I love you so dearly.

ABSTRACT

The purpose of this research is to analyze the effects of perceived quality, perceived price and need for uniqueness on consumer's purchase intention through online store of children import bag. This research used Multiple Linier Regression using SPSS Version 25 to calculate data. Data was obtained from filling the online questionnaires to a hundred respondents. The results of this research indicate that perceived quality, perceived price and need for uniqueness have a positive and significant effect on consumer's purchase intention. As a suggestion, online seller especially in import product should searchs the products that give unique value, different from common product but still have a good quality.

Keyword : perceived quality, perceived price, need for uniqueness, consumer's purchase intention, children import bag.

INTRODUCTION

Export and import are an inevitable activities of international trading. They bring postive and negative impacts. The positive impacts such as job opportunities and foreign exchanged could be increased. However, it also brings the negative impact such as loss of sense of loving for domestic product due to a new lifestyle in Indonesia. In Indonesia itself, The Central Bureau

of Statistics reported that there was a surge of import growth at 20,15% throughout 2018 (Rahadian, 2019). It was possible because the tendency of Indonesian consumers to purchase and consume import products. According to Utami (2017), Indonesian consumers choose import products because they have a high quality, attractive packaging, and always have innovation to engage the consumer.

Import product was dominated digital market in Indonesia. The data from Ministry of Industry shows that 90% products in Indonesia's e-commerce are import products. Survey from Markplus Insight shows that top three most purchased products through online store in Indonesia are apparel (61,7%), shoes (20,2%), and bag (20%). One of phenomenon in Indonesia every entrance a new school year is to purchase a new school stuffs. Released from kompas.com, sales for school stuffs increased significantly than previous months every a new school year. Also, sales of children bag in website Tokopedia was increased more than 17 times (Cahya, 2018). From the explanation above, it can be seen that online sales for children import bag can be potential and prospective business option.

The sellers have to able to recognize the market and the factor that could be influences consumer's purchase intention on their products. According to Kotler & Keller (2012), purchase intention means the likelihood that a consumer will purchase a particular product. The higher the

purchase intention, the greater the purchase probability. Therefore, it becomes crucial for seller to understand what is the exact factor that could be affecting consumer's purchase intention. In this research, author examines three possibility factors that could be affecting purchase intention. They are perceived quality, perceived price and need for uniqueness.

LITERATURE REVIEW

Purchase Intention

Purchase intention is about plan of consumer to purchases particular product and how many product required in certain period (Howard, 1994). It could be said that purchase intention is mental statement from consumer that reflected purchasing plan of some products on particular brand. According to Ferdinand (2002), purchase intention was divided into four dimension as transactional intention, referential intention, preferential intention and exploratif intention.

Perceived Quality

Perceived quality is consumer perception to whole quality or excellence of the product or sevice as well as consumer expected (Aaker, 2013). There are some previous studies that analyze the effect of perceived quality to purchase intention. Asshidin, Abidin & Borhan (2016) were compared America and local product in Malaysia's consumer. The result indicates that perceived quality significantly affected purchase intention to both products. The result was similar to Demir & Tansuhaj (2011) and Kumar, Lee & Kim (2009) study. Rehman, Latif & Rana (2018) conduct study to compare perceived quality between British consumer and Pakistani consumer towards America product. The result shows that perceived quality has positive effect to British consumer on America product, but negative effect to Pakistani consumer. Otherwise, the result of

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9222>

Arifin & Fachrodji (2015) and Edison & Restuti (2014) shows that perceived quality has no significant effect to purchase intention.

Consumer has tendency to choose import product than its local. Import product associated into good quality. Product which has good quality will create high perceived quality that affected consumer's purchase intention. From explanation above, the proposed hypothesis is:

H₁ : perceived quality has effect to consumer's purchase intention.

Perceived Price

Peter and Olson (2008) state that "price perception concern how price information is comprehended by consumers and made meaningful to them". Evaluation and analysis consumer through the price was strongly influenced by consumer behaviour. The consumer judgement into cheap or expensive would be different from every consumer, depends on individual perception. Delafrooz, Paim & Khatibi (2011); Wijayasari & Mahfudz (2018); Suarjana & Suprpti (2018) say that perceived price, in competitive price, has significant effect to online purchase intention. The study result of Edison & Restuti (2014) shows that perceived price has a positive effect but not significant to consumer's purchase intention. Otherwise, Kim, Li & Gupta (2005) and Setiawan & Achyar (2012) find that perceived price has negative effect to purchase intention of online book store for potential consumer.

In online selling, consumers can't directly see and feel the product. Therefore, how the way consumer think about the product price is important matter. If consumers think the prices are suit to their expectation, it will becomes driven factor into consumer's purchase intention to the products. From explanation above, the proposed hypothesis is:

H₂ : perceived price has effect to consumer's purchase intention.

Need For Uniqueness

Need for uniqueness explains individual perception and response about similarity to others. The higher similarity could decrease individual self esteem. Moreover, every people has tendency to search the uniqueness in particular level (Synder & Fromkin, 1980). Need for uniqueness is personal nature to pursue the difference from others by acquires and utilizes the product with the purpose to elevates social image and identity (Schiffman & Wisenblit, 2015). Kumar, Lee & Kim (2009) define need for uniqueness as the willing to be different from others in a community. Their study show there is positive relationship between need for uniqueness and purchase intention of America apparel in India' consumer. The above result is similar to Rehman, Latif & Rana (2018) and Tariq & Iqbal (2015). Latter, Phau & Marchegiani (2010) do study in import apparel and Chihab & Abderrezzak (2016) do study in luxury parfume. Their study show opposite result, need for uniqueness has no significant effect to consumer's purchase intention.

One of factor that driving consumers to purchase product is their personality. Consumers who have high need for uniqueness, have tendency to search the unique product in the market that really special and different from others. Children import bag offers various design, full colour, and unique. From explanation above, the proposed hypothesis is:

H₃ : need for uniqueness has effect to consumer's purchase intention.

CONCEPTUAL FRAMEWORK

From explanation above, the conceptual framework is as follows:

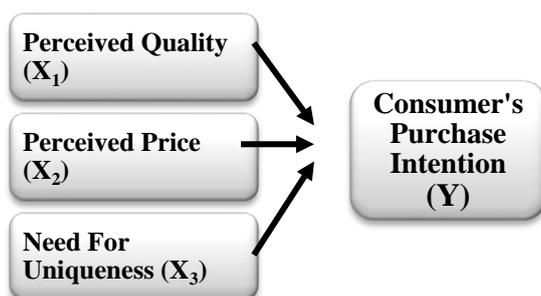

Fig-1 Conceptual Framework

RESEARCH METHODOLOGY

A total of 100 online questionnaires were collected from 100 respondents who domicile in Palembang and have 0-6 years children. Online questionnaires were divided into three parts. The first part was to filtering the respondents according to requirement above. The second part was to gather identity of respondent. The third part was to collect the respondent's response about independent variables (perceived quality, perceived price, and need for uniqueness) and dependent variable (consumer's purchase intention). All statements were rated on a 5-point Likert scale. The data was analyzed using multiple linier regression by SPSS (*statiscal product and service solution*) version 25.

RESULT

Validity Test

Items are declared valid if r_{test} is greater than r_{table} . The value of r_{table} by 100 respondents in significance 0,05 is 0,3610.

Table-1 Validity Test Result

Variable	Point	r_{table}	r_{test}	Result
Perceived Quality (X ₁)	1	0,361	0,867	Valid
	2	0,361	0,909	Valid
	3	0,361	0,914	Valid
	4	0,361	0,83	Valid
	5	0,361	0,828	Valid
Perceived Price (X ₂)	1	0,361	0,869	Valid
	2	0,361	0,862	Valid
	3	0,361	0,924	Valid
Need For Uniqueness (X ₃)	1	0,361	0,862	Valid
	2	0,361	0,771	Valid
	3	0,361	0,823	Valid
	4	0,361	0,752	Valid
Consumer's Purchase Intention (Y)	1	0,361	0,915	Valid
	2	0,361	0,931	Valid
	3	0,361	0,933	Valid
	4	0,361	0,854	Valid

Table.1 shows that all r_{tests} are greater than r_{table} . It means all items are valid as research instrument.

Rp. 6.000.000 - Rp. 10.000.000	27	27
> Rp. 10.000.000	17	17

Reliability Test

The instruments declare reliable if the value of Cronbach’s Alpha is greater than 0,7.

Table-2 Reliability Test Result

Variable	Cronbach’s Alpha	Criteria	Result
Perceived Quality (X_1)	0,919	0,7	Reliable
Perceived Price (X_2)	0,862	0,7	Reliable
Need For Uniqueness (X_3)	0,816	0,7	Reliable
Consumer’s Purchase Intention (Y)	0,929	0,7	Reliable

Table.2 shows that all values of Cronbach’s Alpha are greater than 0,7. It means all indicator variables are reliable.

Respondent’s Overview

Informations that gained from respondents are age, gender, education, and income.

Table-3 Identity Distribution of Respondent

Age	Frequency	%
< 30 years	26	26
31 - 40 years	64	64
> 40 years	10	10

Gender	Frequency	%
Male	17	17
Female	83	83

Education	Frequency	%
Senior High School	5	5
Diploma	20	20
Bachelor	50	50
Graduate	25	25

Income	Frequency	%
< Rp. 3.000.000	13	13
Rp. 3.000.000 - Rp. 6.000.000	43	43

Multiple Linier Regression Analysis

Multiple linier regression is used to explains the relationship among variables that were tested. The regression equation could be seen below:

$$Y = 4,009 + 0,215X_1 + 0,273X_2 + 0,237X_3$$

Where the equation can be explained by below:

- The constant (α) is 4,009, shows that if perceived quality, perceived price, and need for uniqueness variables are 0, then consumer’s purchase intention is 4,009.
- Regression coefficient (β) perceived quality is 0,215, shows that by adding one unit of perceived quality, then it would be increase consumer’s purchase intention of 0,215.
- Regression coefficient (β) perceived price is 0,273, shows that by adding one unit of perceived price, then it would be increase consumer’s purchase intention of 0,273.
- Regression coefficient (β) need for uniqueness is 0,237, shows that by adding one unit of need for uniqueness, then it would be increase consumer’s purchase intention of 0,237.
- The result gives positive values on all independent variables, it means there are relationships to consumer’s purchase intention through online store of children import bag in Palembang, Indonesia besides other variables which not included in this research.

F-Test (Simultaneous)

Table-4 Output ANNOVA

ANOVA ^a					
Model	Sum of Squares	df	Mean Square	F	Sig.
1 Regression	344,220	3	114,740	27,264	,000 ^b

Residual	404,020	96	4,209	
Total	748,240	99		

a. Dependent Variable: CONSUMER'S PURCHASE INTENTION
b. Predictors: (Constant), NEED FOR UNIQUENESS, PERCEIVED PRICE, PERCEIVED QUALITY

Based on Table-4, it can be seen that sig < 0,05 (0,000 < 0,05). It means Ha is accepted. Then, it can be concluded that perceived quality, perceived price and need for uniqueness together have a significant effect on consumer's purchase intention.

t-Test (Partial)

Table-5 Output Coefficients

Coefficients ^a						
Model		Unstandardized Coefficients		Standardized Coefficients Beta	t	Sig.
		B	Std. Error			
1	(Constant)	4,009	1,208		3,319	,001
	PERCEIVED QUALITY	,215	,072	,295	3,001	,003
	PERCEIVED PRICE	,273	,124	,210	2,193	,031
	NEED FOR UNIQUENESS	,237	,081	,295	2,924	,004

a. Dependent Variable: CONSUMER'S PURCHASE INTENTION

Based on Table-5, it described as seen below:

- Sig of X₁ 0,003 < 0,05. It means Ha is accepted and H₀ is rejected. Then, it can be concluded that perceived quality partially has a significant effect on consumer's purchase intention.
- Sig of X₂ 0,031 < 0,05. It means Ha is accepted and H₀ is rejected. Then, it can be

concluded that perceived price partially has a significant effect on consumer's purchase intention.

- Sig of X₃ 0,004 < 0,05. It means Ha is accepted and H₀ is rejected. Then, it can be concluded that need for uniqueness partially has a significant effect on consumer's purchase intention.

Coefficient Determination

Table-6 Output Model Summary

Model Summary ^b				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,678 ^a	,460	,443	2,05147

a. Predictors: (Constant), NEED FOR UNIQUENESS, PERCEIVED PRICE, PERCEIVED QUALITY

b. Dependent Variable: CONSUMER'S PURCHASE INTENTION

Based on Table-6, it can be seen that R² is 0,460 equals to 46,0%. It means that perceived quality, perceived price and need for uniqueness together have a significant effect on consumer's purchase intention is 46,0%. And the rest, 54,0%, was affected by other variables which not included in this research.

DISCUSSION

Perceived quality has significance 0,003 < 0,05 and regression coefficient is 0,215. Thus, perceived quality has a positive and significant effect on consumer's purchase intention. This finding is in accordance to research of Asshidin, Abidin & Borhan (2016) which compared America and local product in Malaysia's consumer. The result indicates that perceived quality significantly affected purchase intention to both products. This finding also similar to Demir & Tansuhaj (2011) and Kumar, Lee & Kim (2009). In this research, consumers consider children import bags in online store have a good quality. Product which has good quality will create high perceived quality that affected consumer's purchase intention.

Perceived price has significance $0,031 < 0,05$ and regression coefficient is $0,273$. Thus, perceived price has a positive and significant effect on consumer's purchase intention. This finding is in accordance to research of Delafrooz, Paim & Khatibi (2011) which shows that perceived price, in this case as competitive price, significantly affected online purchase intention. . This finding also similar to Wijayasari & Mahfudz (2018) and Suarjana & Suprapti (2018). In online purchasing, consumers can't see and feel directly into the products. Thus, the way consumers give perception in price is important. If consumers think the price is affordable with the benefit that they will get, it can be a driven factor to build purchase intention into that products.

Need for uniqueness has significance $0,004 < 0,05$ and regression coefficient is $0,237$. Thus, need for uniqueness has a positive and significant effect on consumer's purchase intention. This finding is in accordance to research of Kumar, Lee & Kim (2009), Rehman, Latif & Rana (2018), and Tariq & Iqbal (2015). Their research show that there are positive relationship between need for uniqueness and consumer's purchase intention in import apparel. The higher need for uniqueness, the higher consumer's purchase intention for the product.

CONCLUSION

Based on result and discussion above, it can be concluded as seen below:

1. Perceived quality has a positive and significant effect on consumer's purchase intention through online store of children import bag in Palembang, Indonesia.
2. Perceived price has a positive and significant effect on consumer's purchase intention through online store of children import bag in Palembang, Indonesia.
3. Need for uniqueness has a positive and significant effect on consumer's purchase intention through online store of children import bag in Palembang, Indonesia.
4. Perceived quality, perceived price and need for uniqueness together have a significant

effect on consumer's purchase intention through online store of children import bag in Palembang, Indonesia.

RECOMMENDATION

Based on result and discussion above, the recommendation is given as seen below:

1. For online seller

Online seller especially in import product should searchs the products that give unique value, different from common product but still have a good quality. Those things have to be conducted for increase consumer's purchase intention that could be affect sales of import product.

2. For further researcher

In this research, perceived price gives a not significant value which has to be examined. Further researcher may analyze what factors could be gives a not significant value. Besides, further researcher could develops amount of sample or other variabel. Thus, variables that could be affect consumer's purchase intention will be well explained. Also, further researcher could divides the sample into several categories and conducts analysis for relationship between those categories and the variables.

Cancer Pain Management at Garissa County Referral Hospital, Kenya

Fatuma. A. Affey¹ and Catherine Mwenda²

¹ Umma University, School Nursing & Midwifery, Department of medical- surgical Nursing

² Mount Kenya University, School of Nursing, Department of Medical-Surgical Nursing

DOI: 10.29322/IJSRP.9.08.2019.p9223

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9223>

Abstract- High prevalence and suboptimal cancer pain management has been reported from resource-limited countries such as Kenya. Precisely, trends of cancer cases are on the increase at Garissa County in Kenya, yet no data exist on management of cancer pain. This study was to examine the prevalence, and cancer pain management of adult patients at Garissa County Referral Hospital. A descriptive cross sectional survey was employed and 94 cancer patients from both outpatient on follow up care and inpatient were recruited to participate. MBPI (Modified Brief Pain Inventory), ECOG (Eastern Cooperative Oncology Group) and focus group discussion (FGD) were used for data collection. Pain Management Index was calculated and significant levels were set at $P < 0.05$ for all tests. Mean age of participants was 50 years, composed of 42 (44.7%) male and 52 (55.3%) female. Prevalence of cancer pain was 78% with majority reporting moderate to severe pain and undertreatment with PIM of (p-value < 0.05). Participants accounting 76.9% male and 66.7% female reported cancer pain interference with ability to walk and 91% male and 70% female reported that pain interfered with their mood. Content analysis was done from focus group discussions conducted and cultural ways of pain management was also captured. A total of 81.9% (77) participants incorrectly utilized WHO analgesic ladders, 65% (61) and 77.6% (73) considered alternative therapy of Quran and Somali herbs respectively for pain management. This study found a high prevalence of cancer pain and suboptimal cancer pain management. Sociocultural perspective of cancer pain management seems acceptable.

Index Terms- prevalence, cancer pain management.

I. INTRODUCTION

Pain is the main symptom that cancer patients experience^{1, 2}. Cancer pain is a subjective and a complex symptom that results from a mixed mechanism, that involves inflammatory, ischemic, and neuropathic and compression mechanisms at multiple sites¹. It is a diverse experience for a cancer patient, modified by genetics, history, mood, expectation, and culture. Cancer pain involves not only physical pain but also psychological, social and spiritual dimensions of an individual^{5, 9}. Thus cancer pain is multi-dimensional occurrence having sensory-discriminative, cognitive evaluative and emotional-motivational aspects. Literature publications of 4117 titles and 122 studies found that pain prevalence rates were 39.3% after curative treatment, 55.0% during anticancer treatment and 66.4% in

advanced disease globally¹⁵. Moderate to severe pain (numerical rating scale score ≥ 5) was reported by 38.0% of all patients¹⁴. Despite the increased attention on assessment and management of cancer pain, moderate to severe pain continues to be a prevalent symptom in cancer patients^{9, 15}. Cancer pain management in African countries is suboptimal and moderate to severe pain is very common among cancer patients⁹. Prevalence of cancer pain reported ranged from 35.7% to 87.5% in many African countries and most patients reported to health facilities in the late stage cancer diagnosis due to the inadequate screening of the disease^{8, 9}. Prevalence of pain and management of 400 cancer patients at Moi Referral Hospital in Kenya reported 66% of patients with undertreated pain and negative scores on the pain management index⁵. The presence of cancer pain in 520 ambulatory patients at oncology unit of national referral of Kenyatta National Hospital in Kenya was 38.5%⁸. Severe pain experience was associated with a late-stage diagnosis of cancer when most patients were also seeking medical help⁸. Studies in Kenya reveal high prevalence and poorly managed cancer pain due to limited treatment options, patients presenting in an advanced stage and limited availability and accessibility of analgesics^{5, 8}. While these studies were conducted at a major national referral hospital in the urban area of Kenya, many cancer patients in rural Kenya live in remote areas and make a long journey to get access to health services¹¹.

Cancer pain has negative impacts that include emotional distress, clinical depression, mood disorders³. The most commonly occurring symptoms in cancer are the pain, emotional distress and fatigue^{3, 12}. An approximately one-sixth of all cancer patients have depression and about one quarter have other mood disorders during treatment². Cancer pain leads to the development of clinical depression, decrease adherence to treatment or therapy, increased suicide rates, more extended hospitalization, poor quality of life and heightened desire to die¹³. Cancer pain also interferes with the different components of patient's life and negatively affects their daily activities, mental health, family and social relationships with others and interactions at workplace. Interference of pain on functional performance had statistical significant associated with the stage of the tumour, presence of metastasis, history of treatment modality, history of pain, and pain management adequacy¹⁰. Cancer patients with tumour stage I and stage II with adequate treatment had less pain interference on functional performance than those with stage III and Stage IV cancers¹⁰. This will result to poor quality of life in cancer patients⁷. Moreover, the challenges of cancer pain management in developing countries has been well documented in several studies

^{5, 8, 9} yet no studies have done in rural and marginalized area of Kenya. The purpose of this study was to establish cancer pain management from cancer patients' perceptive at Garissa County, Kenya.

II. MATERIALS AND METHODS

A descriptive cross sectional survey using MBPI (Modified Brief Pain Inventory), ECOG (Eastern Cooperative Oncology Group) for functional performance and focus group discussion was conducted at Garissa county referral Hospital. . Participants were 94 cancer patients with mean average age of 50years

Study design: A descriptive cross sectional survey of hospital based population of 94 cancer patients from both outpatient and inpatient departments of Garissa County Referral Hospital were recruited.

Study Location: the study area was Garissa County Referral Hospital with 230 beds inpatients capacity and various outpatient clinics. This hospital is situated at Garissa Township that is categorized as a marginalized area of Kenya ¹⁶, with a high number of nomadic pastoralist's population of Somali origin.

Study Duration: 18th May to 17th November 2017

Sample size: 100 cancer patients.

Sample size calculation: The study sample size was estimated from a single proportion design. The target study population was selected using purposive, simple random and snow ball sampling to achieve the desired sample of 154 cancer patients. Our confidence level was 95% and our regression coefficients revealed that effect of pain has the highest standardized Beta coefficient β (0.952) with p value < 0.05 meaning on the regression model, effect of pain was statistically significantly. The sample size actually obtained for our study was 100 patients from both inpatient and outpatient and 6 % drop out rate.

A total of 15 (5participants in each group) participants attended face to face focus group discussion of this study, comprising of 6 men and 9 females. Drafted notes and audio recordings transcription were used to capture the data for analysis. The topic of discussion was cancer pain management and we divided the subtopics in to a) patient awareness of their condition b) participants experience of pain and its intensity, c) intervention they carry out to manage their pain and d) what can be done to improve their pain control.

Subjects & selection method: The study Participants were cancer patients drawn from medical and surgical wards of the hospital, palliative clinic and those on follow up care at hospital neighborhood. Participants were patients with a pathological diagnosis of cancer, aware of their condition, mentally stable and above 18 years to provide consent for the study. Simple random sampling, purposive and snowball sampling were used to recruit participants during the study period of 18/5/2017 to 17/11/2017.

Inclusion criteria:

- 1) All adult cancer patients were considered included
- 2) Irrespective of their period of hospital stay
- 3) Irrespective of type of cancer, stage of cancer disease and other comorbidities present.
- 4) Adult cancer patients who consented

- 5) Adult cancer patients within hospital environment or at home on follow up plan.

Exclusion criteria:

- 1) All Cancer Patients under the age of 18years with mental illness were excluded
- 2) Critically ill cancer patients were excluded from the study.

Procedure of data collection: Each cancer patient was questioned and administered with MBPI questionnaire after signing consent to determine the presence of cancer pain, pain severity, effect and management. They were also questioned on information regarding the cancer type diagnosed, type of pain treatment or analgesics prescribed an alternative therapy to pain. Those patients who could not understand English, the researcher and the research assistant translated the questions to either Swahili or Somali language. ECOG performance status was also scored by the researcher and the research assistant as the patients verbalized his functional performance. Pain intensity was assessed from the adequacy of pain management received by individual patients. Adequacy of treatment was assessed by calculating pain management index (PMI). PMI compares the patient's pain rating against prescribed analgesics to decide if a patient's pain is adequately treated or not.

Content analysis from focus group discussions about cultural ways of managing cancer pain and their challenges in pain management was sorted out. Themes were gathered and clustered for similarities.

Statistical analysis: Questionnaires was sorted, coded and entered in SPSS version 17. Prevalence of cancer pain was calculated using each subject response on the exponential scale rate. Linear regression was used to analyse the relationship between cancer pain management and its independent and intervening variables. To analyse whether the WHO cancer pain management tool was used chi-square was utilised.

Regression analysis was conducted between variables to examine the level of relationship between pain management, pain prevalence, and effects of cancer pain. The desired level of accuracy was set to a confidence level of 95% and significant levels were set at $P < 0.05$ for all tests.

III. RESULT

This study focused on respondent of cancer patients of either gender hospitalized at the GCHR with cancer-related health complications or attending the palliative clinic or on follow up at home. Demographic information of the participants was analyzed to establish the age of cancer patients and current treatment for pain to ascertain how cancer pain was managed. Table I demonstrates participants' composed of 44.7% (42) males and 55.3% (52) females. Majority 40.4% (38) of the participants were 51-65 years in age, followed by 35-50 years with 33% (31) then above 65 years were 23.4% (22) and least below 35 years with 3.2% (4). Majority of participants were female gender 55.3 % (52), with majority no formal education 44.7% (42), from ethnic Somali community 68.1 % (64) and with low income 93.6 % (88) earning less than Ksh. 23, 670 (200\$) per month.

Prevalence of Cancer Pain

The majority of participants (78%) noted that their pain was due to cancer disease while (22%) reported that their pain was not due to medical procedures as shown in Figure 1 below .

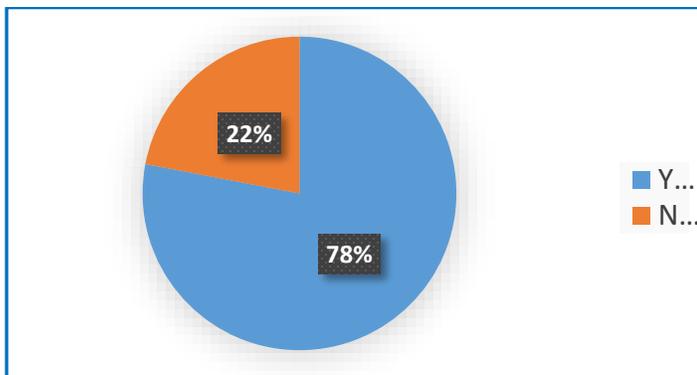

Figure 1: prevalence of cancer pain

Cancer pain management

Pain Management Index (PMI) was calculated to analyze the intensity of pain experienced by cancer patients. This is explained as a way to quantify how pain is adequately managed with pharmacological intervention, as demonstrated in Figure 2 above. The analysis of the adequacy of pharmacological pain management (PMI > 0); and inadequacy (PMI ≤ 0) was calculated using the pain management index. Pain management index is a comparison of the most potent analgesic used by patients on the

worst pain. For this study, the level of pain was scored as follows: level 1 for mild pain (1-3 NRS), level 2 for moderate pain (4-6 NRS) and 3 for severe pain (7-10 NRS). The comparative level of analgesic used was graded as follows: 0 for no analgesic; 1 for non-opioids analgesic used, two was used for mild opioids, for moderate pain, while 3 for strong opioids for severe pain.

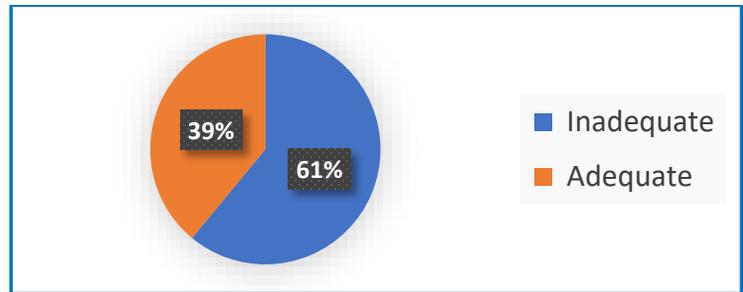

Figure 3: Adequacy of pain management.

Table 2: Pain Management Index

Pain Management Step	Index Score by Reported Pain Level			
	None (0)	Mild Pain (1)	Moderate (2)	Severe (3)
No Analgesic Prescribed (0)	0%	0%	0%	0%
Nonopioids (I)	0%	6.9%	72.4%	20.7%
Mild Opioid (II)	0%	3.3%	66.7%	30.0%
Strong Opioid	0%	35.3%	55.9%	8.8%

Participants were questioned to rate the pain at its least and worst, and the medication they used for each level of WHO analgesic ladder. The purpose of this question was to examine if patients were using the right pain medication for each pain level as prescribed by WHO analgesic ladder. The result of this study revealed that this was not the case. For instance, at the worst pain, patients are supposed to be on the strongest Opioids, that is, Morphine/hydromorphone /Methadone / Levorphanol / Fentanyl / Oxycodone &+Adjuvants. However, when the participants were asked to indicate their pain management at their worst, the majority were using wrong drug level to manage pain. The findings show that (57.1%) of male participants and (73.3%)female who was experiencing severe pain, we're still using level 1 drug (Aspirin/Paracetamol/ Acetaminophen, NSAD's & Adjuvants) contrary to WHO analgesic ladder level 3 for severe pain management guidelines. Similarly, (91%) of male participants and (70%) of female participants were still using Codeine / Hydrocodone / Oxycodone / Dihydrocodeine/tramadol & Adjuvants, which are level 2 pain management drugs and not recommended for severe pain management. Only (29%) of men and (12%) of women were using the right medication for the right level of pain.

Participants were asked whether they were using an alternative treatment for pain management during the study and the following was revealed as in table 3. The study further analyzed the data collected during focus group discussion and came up with emerging themes as analyzed in table 4. Participants' own words were also considered important.

Table 3: Most Prominent alternative cancer pain management therapy

[1] Cultural therapy	[2] F	[3] %
[4] Quran	[5] 62	[6] 65%
[7] Somali Herbs	[8] 73	[9] 77.6%

Table 4: Focus Group analysis (Emerging Themes from Qualitative Analysis)

[1] Question posed	[2] Emerging Themes	[3] Categories
[4] Patient own cancer pain assessment	<ul style="list-style-type: none"> Moderate to severe pain 	<ul style="list-style-type: none"> High level of pain
[5] Patient perception of their pain	<ul style="list-style-type: none"> Cancer Pain has robbed of the simplest of tasks of walking and pleasure Feeling desperation Fatigue/sleep disturbances The feeling of anger and mood disturbance Pain is in control of their life Feel they have inadequate information regarding their condition 	<ul style="list-style-type: none"> Pain has control over patients' life physically, socially and psychologically.
[6] Patients' perception of nursing and institutional pain control	<ul style="list-style-type: none"> Found difficult to express their expectations of nursing and institutional pain management Found difficulty to express nursing in cancer pain management competencies Feel it is not good to always complain and report of pain, healthcare workers will see as a 'bad patient.' Feel they have less support from the nurses and other medical personnel Feel their pain is not well controlled in the institution Expressed inaccessibility of pain medication Expressed the shortage of palliative care nurses at the palliative clinic (one nurse) one patient A said "when the one nurse is on leave from palliative clinic no hope of getting medicine or other support." 	<ul style="list-style-type: none"> Poor interaction between patients and nurse The negative attitude towards health care workers especially the nurses Poor palliative care services and inaccessible analgesic.
[9] Patients pain control methods	<ul style="list-style-type: none"> Reading/ recitation of Quran (Most effective and frequently used) Pain medication from the hospital Use of herbal medicine such as Malmal' (comiphoramyrra) 'huruud' Turmeric, 'qorfe' (Cinnamon) 'hulbad' (Fenugreek), 'sinjibiil' (Ginger), 'filfil' (Black pepper), 'Likke/ Diinsi Burning at the site of pain with hot metal Heat and cold therapy massage 	<ul style="list-style-type: none"> Social cultural practices such various traditional herbs for cancer pain management Spiritual therapy using Quran is believed as a method of cancer pain management.
[12] Challenges in pain management (patients' perspectives)	<ul style="list-style-type: none"> inaccessible pain medications since the most patients were travelling from far in order to get to analgesics Not to disturb the nurses or health workers / to be a 'good patient.' Doctors might find it annoying to be told about the pain that persistent Reports of pain could distract a doctor from curing the cancer If I talk about pain, people will think I am a complainer Limited staff in the palliative clinic Negative attitudes among health workers 	<ul style="list-style-type: none"> Negative attitudes by nurses and other health workers Poor communication between nurses and cancer patients

[13] How to overcome challenges in pain management of cancer	<ul style="list-style-type: none"> • They feel the healthcare workers/nurses and institution know better • The need for more trained staff in the palliative clinic • inaccessibility of pain medication in many centres of Garissa County 	<ul style="list-style-type: none"> • Belief health worker can solve their challenges • pain control medication is inaccessible at GCRH
--	---	--

Cancer patients' who participated in FDGs were questioned on what alternative approaches they consider for cancer pain control. Some of the alternative medicine listed by the FDGs included Somali herbs such as 'Malmal' known comiphoramyrra, 'huruud' Turmeric, 'qorfe' Cinnamon, 'hulbad' Fenugreek, 'sinjibiil' Ginger, 'filfil' Black pepper, 'Likke' (root of the tree crashed to form powder Diinsi). In responding to why they use the Quran, one of the FDG members noted as follows:

"I believe that in reading the Quran I will not only be able to manage my pain... I feel better... I believe I will be healed...I believe Quran is a miracle that was sent by Allah to be a blessing to us both spiritually and physically, and to cure us from any ailments...the words of the Quran are "Shifa" meaning they are able to heal us" (Participant 1, FGD 1)

According to the Islamic beliefs, the Quran can be used to treat all manner of ailment, including my cancer. The "Ruqyah" provides me with the opportunity to use the Quran as the word of Allah, for healing and also "duas" as the words taught by the prophet on healing" (Participant 5, FDG, 1)

In other instances, the study found that apart from relying on traditional herbal medicines, patients relied on heat and cold therapy, and in worse scenarios, some patients used hot metals:

"I have used hot metal and objects to places I was feeling severe pain...when the "Malmal" (comiphoramyrra) wasn't giving me enough relief, I would use a hot metal on my back and arms to relieve my pain...but I also know other patients who use cold therapies, where they put ice-cubes in a bag and place it on places they are feeling pain" (Participant 3, FDG 4)

When asked whether heat therapy or cold worked in the long term, they indicated this measure were short term for pain relief. In moments when pain became unbearable, they would seek medical help from the hospital

Some of the alternative medicine listed by the FDGs included Somali herbs such as 'Malmal' known comiphoramyrra, 'huruud' Turmeric, 'qorfe' Cinnamon, 'hulbad' Fenugreek, 'sinjibiil' Ginger, 'filfil' Black pepper, 'Likke' (root of the tree crashed to form powder Diinsi). In responding to why they use the Quran, one of the FDG members noted as follows:

"I believe that in reading the Quran I will not only be able to manage my pain... I feel better... I believe I will be healed...I believe Quran is a miracle that was sent by Allah to be a blessing to us both spiritually and physically, and to cure us from any ailments...the words of the Quran are "Shifa" meaning they are able to heal us" (Participant 1, FGD 1)

In other instances, the study found that apart from relying on traditional herbal medicines, patients relied on heat and cold therapy, and in worse scenarios, some patients used hot metals:

"I have used hot metal and objects to places I was feeling severe pain...when the "Malmal" (comiphoramyrra) wasn't giving me enough relief, I would use a hot metal on my back and arms to relieve my pain...but I also know other patients who use cold

therapies, where they put ice-cubes in a bag and place it on places they are feeling pain" (Participant 3, FDG 4)

Cancer Pain interferes with functional abilities

Patients scored their functional abilities using scale in MBPI and this was then analysed. The findings indicated the existence of an association between cancer types and its effects on walking ability, $X^2 = 6.072$, $df (3)$; however, the association was not statistically significant (p -value > 0.05), the study also revealed the existence of a relationship between cancer and interfering with patients' mood, $X^2 = 2.167$, $df (3)$; however, the association was not statistically significant (p -value > 0.05), and findings also indicated the existence of an association between cancer and the pain's effect on patients relationships, $X^2 = 3.869$, $df (3)$; however, the association was not statistically significant (p -value > 0.05).

Table 4: Pain Interferes with Walking Ability

I feel my pain is due to cancer		Pain Interference with Walking Ability			
		Does not Affect	Slightly Affects	Moderately Affects	Completely affects
Male	Yes	7(33.3%)	3(60.0%)	18(85.7%)	10(76.9%)
	No	2 (66.7%)	2 (40.0%)	3 (14.3%)	3 (23.1%)
Female	Yes	1 (100.0%)	12 (80.0%)	17 (94.4%)	12 (66.7%)
	No	0 (0.0%)	3 (20.0%)	1 (5.6%)	6 (33.3%)
Chi Square Value		$X^2 = 6.072$, $df (3)$; p value = 0.108			
I feel my pain is due to cancer		Pain Interference with mood			
		Does not Affect	Slightly Affects	Moderately Affects	Completely affects
Male	Yes	0 (0.0%)	12 (92.3%)	12 (66.7%)	8 (80.0%)
	No	1 (100.0%)	1 (7.7%)	6 (33.3%)	2 (20.0%)
Female	Yes	1 (100.0%)	11 (78.6%)	17 (81.0%)	13 (81.3%)
	No	0 (0.0%)	3 (21.4%)	4 (19.0%)	3 (18.8%)
Chi Square Value		$X^2 = 2.167$, $df (3)$; p value = 0.539			

I feel my pain is due to cancer		Pain Affects Relationship with Others			
		Does not Affect	Slightly Affects	Moderately Affects	Completely affects
Male	Yes	7 (77.8%)	9 (90.0%)	8 (88.9%)	8 (57.1%)
	No	2 (22.2%)	1 (10.0%)	1 (11.1%)	6 (23.8%)
Female	Yes	6(75.0%)	9 (90.0%)	6 (85.7%)	21 (77.8%)
	No	2 (25.0%)	1 (10.0%)	1 (14.3%)	6 (22.2%)
Chi Square Value		X ² = 6.072, df (3); p value = 0.108			

ECOG performance status

ECOG is a scale used by oncologist and researchers to assess how a patient’s disease is progressing, and how it has interfered with patients’ daily activities. For this study, (99%) indicated they take daily pain drugs and study sorted to assess their ECOG performance status. For instance, ECOG score of 0(a patient is fully active, and carries his/her duties without hindrance); a score of 1 means (restriction in patience physical strenuous activities, but can carry light house work); score of 2 means (patient is ambulatory and not able to carry any work activities); a score of 3 means (patient has limited self-care and refined to bed) and a score of 4 means patient is (completely disabled, and cannot carry on any self-care). This study revealed that 78 % (32) had experienced ECOG status 3. The findings also show that in all cancer categories, female were less likely to experience cancer pain as compared to the male participants (OR=0.67). However the experience is not statistically significant (p-value > 0.05). Those whose ECOG status slightly affecting were more likely to experience cancer pain compared to those whose ECOG status are affected (OR=1.125). The patients experiencing ECOG pain level 3 had a statistically significant pain threshold level (P value <0.05).

ECOG status of participants

Variable	Cancer Pain		OR (95% CI)	P-value	
	Yes	No			
Sex	Male	31 (73.81%)	11 (26.19%)	1.00 (Ref)	0.422
	Female	42 (80.77%)	10 (19.23%)		
Daily Pain	93 (98.9%)	1 (1.1%)	-	-	
Medication in 7 Days	93 (98.9%)	1 (1.1%)	-	-	

ECOG Status					
0	0 (0%)	0 (0%)			
1	29 (78.38%)	8 (21.62%)	1.00 (Ref)		0.000
2	12 (75%)	4 (25%)	2.483 (1.82 – 3.66)		0.002
3	32 (78.04%)	9(21.96%)	3.421 (1.25-3.78)		

Regression of Variables

To establish the level of relationship between pain management, and effects of cancer pain a regression analysis between variables was done. The result shows an adjusted R-value of (0.898), which means, (89.8%) of the variability of pain management, interference of pain and cancer pain prevalence. The Analysis of Variance (ANOVA) was also carried out to examine if there is significant variance in the means between pain management, interference of cancer pain, and pain prevalence, F (2, 91) = 4.622; (p-value < 0.05) which means the mean difference between the variables was statistically significant. Regression coefficients revealed that the effect of pain has the highest standardized Beta coefficient β (0.952); p-value < 0.05 which means on the regression model, the effect of pain was statistically significant. The Beta coefficient β (-0.009) for pain prevalence was not statistically significant.

IV. DISCUSSION

This study revealed that there was a relationship between cancer pain prevalence and cancer pain management. There cancer pain also interferes with normal functioning. Pain management is a dependent variable while the prevalence of pain and the effect of pain are independent variables. We found a high prevalence of cancer pain at (78%) with the majority of patients experiencing moderate to severe pain. This is similar to ^{5, 8} studies of Kenya, though the prevalence of pain tends to be higher in this study. This is because our study was carried in a rural, marginalized area of Kenya with the high number of population practicing nomadic lifestyle.

This study revealed poor and incorrect utilization of WHO analgesic ladder for pain management by many participants. Inadequate cancer pain management was also reported by 61% (57) participants with (PMI ≤ 0). It was also found that wrong level of WHO analgesic ladder was used to manage the wrong level of pain intensity. That is (57.1%) of male participants and (73.3%) female who were experiencing severe pain and still utilized level 1 drug (Aspirin/Paracetamol/ Acetaminophen, NSAD's & Adjuvants) instead of level 3 with strong opioids (Morphine/hydromorphone /Methadone / Levorphanol / Fentanyl / Oxycodone &+Adjavants). This result is similar to ⁵ with 66% of patients undertreated for pain and had negative scores. Our study also found that many participants were using alternative cultural approach for pain management. A total of 65% and 77.6% used the Quran and Somali herbs respectively. This is similar to ¹² that revealed Islamic healing practices continued to be accepted by

many cancer patients despite the advances in the modern treatment of cancer pain.

The findings in this study indicated that there is an association between cancer pain and interference with walking ability at (p -value > 0.05) and majority (76.9%) of male participants and (66.7%) female participants have been affected. We also found that there is a relationship between cancer pain and mood interference with patients at (p -value > 0.05) and so as pain's effect on patient's relationships with others at (p -value > 0.05). Therefore cancer pain has a negative impact because it affects the patient's physical activity, mood and relationship with others^{6,7}.

The finding in this study is similar¹⁴ who found that cancer patients do sometimes rely on more than forty-seven medicinal plants and traditional healers, particularly in Somali and Ethiopia for the treatment. Garissa being predominantly occupied by Somali community, this explains why patients under this study resorted to various types of herbs. On the use of herbal medicine as had been established by the findings of this study, World Health Organization (2008) study had earlier documented that there is a 70%-80% use of complementary and alternative medicine (CAM) among the public of many developed countries. Somalis believed that Allah gives someone the burden of pain so one should not express or verbalize the pain¹⁷ and most of our patients could easily express their pain.

V. CONCLUSION

Management of cancer pain is suboptimal in Kenya. Our study found a high prevalence and an adverse effect of cancer pain leading to poor quality of life of cancer patients at Garissa County Referral Hospital. The study also found that most patients rely more on alternative therapy and sociocultural perspective pain management. Therefore, there is a need for acceptable strategy and understanding alternative therapy for cancer pain management at GCRH. We recommend more studies in cultural perspective for pain management and knowledge and skills of healthcare workers in cancer pain management

ACKNOWLEDGEMENT

We appreciate the support accorded by a senior nurse in charge of the Garissa County Referral hospital Mr Hassan Abdullah and the Palliative Care Nurse the hospital Ms Mumina Mohamed during the data collection period. We also acknowledge the cancer patients who participated and sacrificed their time to provide information for the study.

Abstract -- This study aims to improve literacy skills of students in grade 3 through a tiered book. The study location was located in Muhammadiyah Elementary School 2 GKB, with the subjects of the study were 30 students in class 3-A. This study used Quasi Experiment with the design of *one group pretest posttest design*. This research was conducted in 2 meetings, by doing several stages, namely, developing a Learning Implementation Plan (RPP), Student Worksheet (LKS), and Literacy Read-write Skill Test. Data collection techniques use the method of observation of teacher activities and student activities, tests, and student response questionnaires. The results showed an increase from the first meeting to the second meeting. For teacher activities at the first meeting the percentage was 84.06%, and at the second meeting the percentage increased to 93.84%. The activities of students in the first meeting had a percentage of 75.38% and at the second meeting the percentage increased to 92.30%. improvement of students' literacy literacy skills can be seen from the results of evaluations at the *pretest* and *posttest* which respectively have the results of an average *pretest* score of 52 and the test *posttest* value with an average of 89. While the response of students to learning activities using tiered books shows the percentage by 86%

Keywords: Literacy literacy skills, Tiered Books.

I. INTRODUCTION

According to Didik Suhardi et al. (2013), in order to be able to excel in participation and engagement amid globalization and regionalization in the 21st century, national education needs to focus or pivot on three main things, namely basic literacy, competence, and character quality. The basic literacy that needs to be used as our education axis is (1) literacy literacy, (2) numeracy literacy, (3) scientific literacy, (4) digital literacy, (5) financial literacy, and (6) cultural and civic literacy. one of literacy. Of the six basic literacy available, literacy that is very important to master is literacy. Both literacy has a big influence on daily life, so that someone will be able to live his life with more quality.

According to Saryono, et al (2012) reading and writing is the literacy known as the earliest in the history of human civilization. Reading skills as one of the written language skills that are important for students to have to be able to communicate verbally or in writing. Reading skills must be instilled in every student, either by themselves or other people with the aim of increasing achievement in the future (Bakar, 2014). In addition, there are other basic skills that are in line with reading skills are writing skills. Writing skills are a skill in expressing ideas through language media. Writing is an activity in using or applying vocabulary, writing, and language structure in a productive and effective manner in the form of writing (Nurgiantoro, 2001).

Reading is someone's basic capital in understanding and knowing various kinds of information. While writing is a follow-up of understanding the information received. To support and achieve these objectives, adequate reading material is needed in terms of themes, and the level of reading difficulties so that the development of reading skills which will be continued with writing skills can be carried out well and achieve the expected results.

The existence of quality books has an important role in fostering a culture of literacy. To ensure the availability of quality books, required bookkeeping governance that can be accounted for through the arrangement of bookkeeping systems in a systematic, comprehensive, and integrated manner. One book that is considered capable of meeting the needs of students is a tiered book, a tiered book is a reading book in which there are texts and images that are adapted to students' reading skills. Reading with tiered books will be a solution to improve students' reading skills from the beginning (Kompasiana, 2018).

According to YLAI (2017), tiered books consist of big books and tiered reading books. Tiered books play an important role for students in the introduction of letters to advanced reading, because tiered reading books are made not only for reading, but also include strategies to attract students' attention to the reading they read.

Chall (1983) explained that the stages of reading development (stages of reading development) that are in accordance with the development of literacy and easier to understand the phases of phasing are with six stages (stages 0 to stage 5). In stage 3, the Chall divides again into phases A and B, so as a whole the classification amounts to 7. Based on the Chall gap, then the level setting for the book gap is 7 (seven) levels, namely: A, B, C, D, E, F, and G.

In literacy education, matching readers with text, aims to develop readers' skills in handling difficult texts gradually. Therefore, the teacher needs to choose a book whose level of difficulty increases gradually. In addition, the reader needs to be accompanied in understanding the text. This reader assistance is in line with the concept of Vigotsky scaffolding. Vygotsky (1978) calls this process scaffolding, which refers to teaching with *zone of proximal development*. This scaffolding process defines "space between," the space that exists between activities that students can do independently and activities that students cannot do, even with help. By teaching this "space between" zones, the teacher helps students to reach a higher level.

There is a lot of research on tiered books. Research conducted by Kusmiyati (2017) Comparative Study of Interest and Reading Ability of B3 Program Recipient School Students and B3 Non-Recipient Schools in Karangrejo District, Purbalingga Regency. The study compared the results of interest and reading ability in students who received tiered books and those who did not. The results of his research prove that students who were schooled facilitated with a Tiered Reading Book (B3) had a higher reading interest and reading ability than students who were not educated with a Tiered Reading Book (B3). That is because the Tiered Reading Book (B3) is able to provide solutions to problems for students by providing interesting offerings and contents of the book according to their level.

Another study by Supartinah, et al. (2016) Development of Guidelines for the Characteristics of Javanese Language Books in the Middle School. This study uses R & D research with a 4-D development model. The component of the gap in it is the same, that is, the content of the text that is adjusted to the initial to the advanced gap with supporting illustrations. While the differences in the variables, namely in this study measuring student character education. In addition, tiered books in this study use Javanese. Other studies have also been conducted by Karen (2017) *Using Alphabet Books Across Grade Levels: More Than 26 Opportunities*. This journal aims to find out the use of the alphabet book as a medium to increase students' interest in learning letters starting from the most basic vocabulary to forming a complete sentence. In addition, in the alphabet book there are various themes and in the delivery there are visual aids or images that match the intended word. The alphabet book is a book in which there are words or writings which at the beginning of the word begin with the alphabetical order A-Z supported by images that match the intended content. The difference, this study measures student learning outcomes in recognizing simple letters and words in accordance with the alphabet.

Quoted from the results of interviews conducted by researchers at one of the 3-A grade teachers at GKB 2 Muhammadiyah Elementary School on May 24, 2019, Evi Eryana Hapsari stated that grade 3 literacy literacy skills at Muhammadiyah 2 Elementary School GKB were still lacking. There are some students who still cannot read and write fluently. Currently, they are in the low class and will go up to high class, which is class 4. So, before going to class 4, they are required to have qualified literacy skills. This can be seen from the value of Indonesian language subjects in the aspects of reading and writing, there are some students who have grades under the KKM. In addition, the interest in reading and writing students is also still relatively low because there are not many students who are interested in reading to the library due to the lack of interesting books for them.

Reading and writing are the basic capital to know and understand the information that has been received. So, it must be implanted from small to adult in the context of family, community, and education. To achieve this goal, a person needs adequate reading books and is adjusted to the level of difficulty of his book so that their literacy literacy can be well developed and facilitated. However, books that are in accordance with the level of ability of children are very difficult to find on the market. In fact, books are one of the supporting ingredients in improving children's ability to read and write. In Muhammadiyah 2 Elementary School GKB there is already a library. In addition, there is a reading corner in each class. However, children do not use it well, because existing books tend to be boring and not according to their needs. Therefore, it is expected that there are books that can provide interesting reading for students and according to their needs. One of these books is a tiered book.

If observed, the statement of one of the teachers interviewed was that the facilities and infrastructure contained in the school were adequate, namely the existence of a library. However, the lack of interesting reading books and books that do not fit the needs of students makes students' reading interest less, therefore, in this study, researchers will try to use

II. METHOD

This study uses a type of quantitative research. The location of the study was at Muhammadiyah Elementary School 2 GKB. The subjects of the study were 3-A grade teachers and grade 3-A students at Muhammadiyah Elementary School 2 GKB with 30 students. This research was carried out in a collaborative form between researchers and classroom teachers. The research design used was *one group pretest posttest design*. The design of this study will use one group which will be observed at the *pretest* (O1) stage which is then followed by giving certain treatments (X) and *posttest* (O2). The one-group *pretest-posttest* design can be written in the form:

O1 X O2

Information:

- O1** = initial test (*pretest*) to find out students' critical thinking skills
- O2** = final test (*posttest*) to find out students' critical thinking skills
- X** = treatment of learning by using edmodo-based e-learning in problem-based learning

Data collection techniques use the method of observation of teacher activities and student activities, tests, and student response questionnaires. Data collection techniques in the form of tests are prepared to analyze the improvement of students' literacy literacy skills and are given at the beginning and end of learning. Data collection tools use evaluation sheets. The questions on the evaluation sheet are adjusted to the learning indicators provided by the teacher.

III. RESULT AND DISCUSSION

Result

The following will be explained about the results and discussion of quantitative research conducted by researchers with the title "Improving Literacy Skills in Reading and Writing Students Through Tiered Books for Grade 3 Students of Elementary School". This study uses Quasi Experiment with the design of *one group pretest posttest design* to obtain data on teacher activities, student activities, increase the test of literacy literacy skills, and student responses.

1. Implementation of RPP in Teacher Activities

The following is a table of implementation of lesson plans by the teacher:

Table 1 Teacher Activities

Meeting	Teacher Activity Average Score	Percentage of Teacher Activity	Category
1	4.23	84.6 %	Good
2	4.69	93.84 %	Very Good
Average	4.46	89.22 %	Very Good

Based on Table 1 it was shown that learning with tiered books to improve students' literacy literacy skills was carried out in a very good category. The data shows the percentage of learning feasibility in each meeting containing preliminary activities, core activities, and closing activities which were assessed by two observers. At the 1st meeting the final average score was 4.23 with the percentage of suitability of the two observers' evaluations of 84.6%. While at the second meeting the final average score was 4.69 with the percentage of suitability assessment of the two observers at 89.22%.

2. Student Activities

Table 2 Student Activities

Meeting	Average Student Activity Score	Percentage of Student Activities	Category
1	3.76	75.38 %	Good
2	4.61	92.30 %	Very Good
Average	4.19	83.84 %	Good

Based on Table 2, it is shown that in general the student activities observed in each meeting recorded by two observers during the learning process are considered Good. At the 1st meeting, the final average score of activity was 3.76 with a percentage of two observers matching 75.38%. While at the 2nd meeting the final average score was 4.19 with the percentage of appraisal of two observers 83.84%.

3. Literacy Literacy Skills Test

Table 3. Literacy Literacy Skills Tests

Student	Pretest		Posttest		Enhancement	
	Score	Category	Score	Category	G	Category
1.	50	Not Complete	90	Complete	0.8	High
2.	60	Not Complete	80	Complete	0.5	Medium
3.	50	Not Complete	95	Complete	0.9	High
4.	60	Not Complete	80	Complete	0.5	Medium
5.	45	Not Complete	75	Complete	0.3	Medium
6.	75	Complete	100	Complete	0.7	High
7.	50	Not Complete	90	Complete	0.8	High
8.	80	Complete	95	Complete	0.7	High
9.	60	Not Complete	90	Complete	0.8	High
10.	75	Complete	85	Complete	0.7	High
11.	50	Not Complete	100	Complete	0.9	High

12.	30	Not Complete	85	Complete	0.7	High
13.	35	Not Complete	85	Complete	0.7	High
14.	60	Not Complete	90	Complete	0.7	High
15.	65	Not Complete	100	Complete	0.7	High
16.	60	Not Complete	90	Complete	0.5	Medium
17.	75	Complete	90	Complete	0.7	High
18.	50	Not Complete	95	Complete	0.9	High
19.	30	Not Complete	80	Complete	0.6	Medium
20.	70	Not Complete	100	Complete	1.0	High
21.	75	Complete	85	Complete	0.6	Medium
22.	65	Not Complete	100	Complete	1.0	High
23.	65	Not Complete	90	Complete	1.0	High
24.	55	Not Complete	90	Complete	0.7	High
25.	60	Not Complete	95	Complete	0.8	High
26.	40	Not Complete	80	Complete	0.6	Medium
27.	30	Not Complete	85	Complete	0.7	High
28.	50	Not Complete	90	Complete	1.0	High
29.	75	Complete	100	Complete	1.0	High
30.	50	Not Complete	85	Complete	0.5	Medium
Total	1570		2660		22,5	
Average	52	Not Complete	89	Complete	0.75	High

Based on Table 3, it is shown that the average score of students' literacy literacy skills at *pretest* is 52 with the Not Completed category, while at *posttest* it is 89 with the Completed category. Based on the two data, there is an increase in the average value of students' literacy literacy skills before and after the implementation of tiered books in classroom learning. Improvement of students' high literacy literacy skills with an average score of *n-gain* of 0.75

4. Student Response

Table 4. Student Response

Student	Questionnaire Indicator										Σ TSEV	Σ s_max
	1	2	3	4	5	6	7	8	9	10		
1.	5	4	4	3	3	3	4	5	3	5	39	50

11.	5	4	4	5	5	5	4	5	5	5	47	50
12.	4	5	4	5	4	4	4	4	5	5	44	50
13.	5	3	4	5	5	5	5	5	4	3	44	50
14.	5	4	5	4	5	5	5	5	5	4	47	50
15.	3	4	3	4	4	4	4	3	5	4	39	50
16.	4	5	3	3	5	4	4	4	5	5	43	50
17.	4	3	5	5	4	3	4	5	4	5	42	50
18.	5	3	3	5	5	5	5	5	4	5	45	50
19.	5	4	3	4	4	4	3	5	5	3	40	50
20.	4	5	4	3	4	5	5	4	3	4	42	50
21.	4	5	3	3	4	5	3	5	5	5	42	50

22.	3	5	5	4	3	4	3	5	5	5	42	50
23.	5	4	3	5	3	5	5	5	4	4	43	50
24.	5	4	4	5	5	4	4	5	4	4	44	50
25.	5	4	3	5	4	4	4	4	4	3	41	50
26.	4	4	5	5	5	5	5	5	4	4	46	50
27.	5	3	3	5	5	5	5	5	4	5	45	50
28.	3	4	5	3	4	5	5	5	5	5	44	50
29.	4	3	5	4	5	3	4	5	4	4	41	50
30.	4	5	5	5	4	5	5	4	4	4	45	50
	Jumlah										1300	1500

Table 4 shows the percentage of student responses to learning activities using tiered books through 10 statement items. Of the 10 items of statements that have been given, obtained answers with very good categories. Based on the table, it can be interpreted that the students' response to learning that has been done is Very Good with a final percentage of 86%.

Discussion

1. Teacher Activities

Data on the results of teacher activities on tiered books developed are used during the learning process in order to facilitate students' understanding of the material to be delivered. The use of tiered books will help teachers make students' literacy literacy skills more than before. Data obtained from tiered book trial activities was carried out in the 3rd grade of Muhammadiyah 2 GKB Gresik Elementary School. The results of the observation of teacher activities towards the use of supplementary books developed are as follows;

Teacher activities in learning activities achieve success if the majority (76% to 99%) of learning material can be mastered by students. From the observation results, the teacher's activity showed 89.22%. The conclusion from observation of teacher activity is a tiered book can be mastered by students optimally / very well. so that it is interpreted in a very good category.

2. Student Activities

Student activities are observed during the learning process by implementing tiered books to improve students' literacy literacy skills. Student activities were assessed using student activity observation sheets developed through observations made by two observers during the learning activities. The observation results of student activities using tiered books to improve students' literacy literacy skills can be seen in Table 2.

There were 13 aspects observed as assessment material by two observers during the learning process. The thirteen aspects are contained in the student activity observation sheet developed. The assessment starts from the beginning of the learning activity until the end of the study for two meetings. Based on the results of the analysis of the assessment of observations of activities at each meeting listed in Table 2 shows the average score of student activity. At the first meeting, the final score of the activity was 3.76 in the good category. Whereas, in the second meeting the final average score was 4.72 with a very good category.

This increase shows that student activities that are expected to emerge during learning can be raised and implemented very well. The statement is supported by the percentage of appraisal suitability conducted by the two observers for 2 consecutive meetings namely 75.38% and 92.30%. on the student activity sheet, the aspect that is expected to emerge during learning is a tiered book reading activity that is completed up to level 6 and students successfully answer questions at each level accompanied by the truth in vocabulary writing.

The fifth, sixth, seventh, and eighth student activities in table 4.7 are interrelated activities. The four activities of the students are follow-up activities carried out by students in reading tiered activities starting from level 1 to level 6 conducted. After reading up to the mastered level, it will be continued by answering questions on each level and writing vocabulary at each level.

In the activity table presented, the four activities experienced an increase in the average score in two meetings. The first meeting showed the acquisition of a score in a good category and at the second meeting in a very good category. This shows that students have begun to be able to read, answer questions and write well. Based on the exposure of the results in Table 4.7 it can be concluded that the percentage of activities carried out by students is classified as Good, which means that each activity is carried out properly by students so that learning activities can be carried out well and in accordance with the lesson plan.

3. Literacy Literacy Skills Test

Students' literacy literacy skills are measured by giving *pretest* questions at the beginning of the activity before learning by using tiered books based on book gaps, and *posttest* questions when the entire series of learning activities are held during 2 meetings using tiered books based on book gaps. The assessment instrument used is a test of literacy literacy skills that refers to four indicators of literacy literacy skills, namely reading the contents of the story text smoothly, explaining the text content of the story properly and correctly, answering questions according to the text content correctly, and writing vocabulary words in each paragraph correctly.

The results of the student literacy literacy skills test are used as a basis for determining the category of literacy literacy skills possessed by students. The results of tests of student literacy literacy skills are presented in Table 3. Based on Table 3, it is

indicated that the average test scores of students' literacy skills at the *pretest* category are not completed, while the *posttest* results are categorized as completed. From the two data, there is an increase in the average value of students' literacy skills before and after the application of tiered books based on the book gap. Improved tiered book skills High category with an average *n-gain* score of 0.75.

Based on the data from the results of the test scores of students' literacy skills, the completeness data for each test indicator also showed that the students' literacy skills generally showed that all the indicators of the students' literacy skills at the *posttest* were categorized as Completed. The completeness category refers to student KKM which is ≥ 75 . This is indicated by the analysis of *n-gain* score where the gain value for each indicator has increased. Student literacy skills can be developed through a student-centered learning approach (Snyder & Wiles, 2015).

Based on the discussion and elaboration of the results of the analysis of the completeness of the indicators of students' literacy skills above, it can be concluded that tiered books can improve students' literacy skills. As well as the research conducted by Kusmiyati (2017) Comparative Study of Interest and Reading Ability of B3 Program Recipient Students and B3 Non-Recipient Schools in Karangrejo District, Purbalingga Regency. The results of his research prove that students who were schooled facilitated with a Tiered Reading Book (B3) had a higher reading interest and reading ability than students who were not educated with a Tiered Reading Book (B3). That is because the Tiered Reading Book (B3) is able to provide solutions to problems for students by providing interesting offerings and contents of the book according to their level.

So, based on some of the literature studies above it can be concluded that the use of tiered books is an effective solution to improve elementary school students' literacy skills.

4. Student Response

In this study, student responses were assessed using the response questionnaire distributed by the teacher to students to assess students' responses to learning that had been conducted during two meetings using tiered books to improve the literacy skills developed. The questionnaire that was disseminated contained 10 items of positive statements that students had to fill in by giving a checklist. Fill out the questionnaire sheet using a Likert scale with 5 rating categories (Very Less, Less, Enough, Good, Very Good).

Student responses to learning that lasts for two meetings can be used as a reference for learning effectiveness. If students respond positively, then the learning given during the two meetings can positively improve students' literacy skills and can help students understand the contents of the story. The results of the student analysis shown in Table 4 show that students gave very good responses to the tiered books that were developed as well as the learning activities they attended during the two meetings.

Table 4 shows that the response is very well seen in item statement number 1 which shows the appearance of tiered books making students interested in reading it. Item number 6 explains that through tiered books, students' interest in reading is increasing, and item number 7, through tiered books, increases student interest in writing. Meanwhile, the response with a balanced percentage can be seen in item statement number 4, namely tiered books adding insight and new knowledge to students.

Based on the results of the response analysis, the final conclusion is that overall the percentage of 86% of students respond very well to tiered books and instruments for assessing students' literacy skills developed and implemented in learning activities for two meetings can help students understand the contents of the stories and can improve literacy skills during learning activities.

IV. CONCLUSION

Based on the data presented, it was concluded that the use of tiered books can improve literacy skills in grade 3 students of elementary school.

Reading books given to students must be books that have criteria that are in accordance with their needs and provide positive values for students, as well as the criteria contained in a tiered book. Therefore, when students choose or read a book must be accompanied by assistance from parents and teachers. In addition, the teacher needs to provide guidance to students regarding literacy skills. Therefore, the teacher must provide reinforcement and assistance in terms of reading and writing because both are basic things that must be mastered by students before learning other skills.

Abstract

The aims of this study is to describe students' reasoning in solving higher order thinking skills (HOTS) problems in fraction material reviewed based on adversity quotient. The subjects are three students namely one student with quitter type, camper and climber. The instruments used included the Adversity Response profile (ARP), HOTS tests and interview guidelines. The process of data collection is done by giving tests and interviews to get more in-depth information. The results showed students' reasoning ability with the type of quitter had not achieved basic level thinking skills, reasoning students with the camper type were in critical thinking and the reasoning of students with the climber type was on the ability to think creatively.

Keywords: *Reasoning, HOTS Problem, Fractions, Adversity Quotient.*

I. Introduction

One of the subjects that has an important role in developing student reasoning is mathematics. In accordance with Permendikbud Number 59 of 2014, the goal of mathematics lessons given to students since elementary school is to equip students with the ability to think logically, analytically, systematically, critically, innovatively and creatively, as well as the ability to work together. (Permendikbud, 2014). All of these thinking skills are very useful for students in processing the information obtained, evaluating the information so that they are able to determine new solutions in solving a problem.

Based on the learning objectives above, it can be said that mathematics and reasoning are like two sides of a coin that cannot be separated. Both show a very strong relationship where reasoning becomes important in mathematics. Corner (2014) explains that "*It has long been accepted by a reasoning important in mathematics both in learning mathematics and in doing.*

The same opinion was also expressed by Russell (1999) that "*reasoning is fundamental to understanding mathematics and mathematical reasoning should be promoted by engaging*

students in investigating, representing, conjecturing, explaining and justifying mathematics. Shadiq (2007) states that through reasoning abilities students can show and analyze every problem that appears clearly, can assess something critically and objectively, can fuse opinions and ideas in a coherent and logical way, be able to draw conclusions and decisions correctly and be able to solve problems appropriately. The *National Council of Teachers of Mathematics* (NCTM) explains that there are 5 standard mathematical learning processes that students must have namely problem solving, reasoning and proof (*reasoning and proof*), communication (*communication*), connection (*connection*) and representation (*representation*) (NCTM, 2000, p.164). Reasoning in mathematics can help students use reasoned skills in making predictions on the basis of their experience so that they gain an understanding of mathematical concepts and are able to apply them so that learning becomes meaningful (*meaningful learning*). English (2004) states that "*The traditional view of computational and analytical mathematical reasoning as superior has been revised to accommodate processes that are important in today's knowledge based. These include gathering evidence, analyzing data, making conjectures, constructing documents, drawing and validating logical conclusions and proving assertions* "

According to Klurik & Rudnick (1995) reasoning includes basic thinking, critical thinking and creative thinking. Basic thinking is the ability of students to understand the concepts in mathematics correctly. Students are said to understand mathematical concepts when they are able to express or explain concepts using their own words and not just memorize. In addition, he can also find and explain the relationship between one concept and other concepts in solving a problem. Critical thinking is thinking that involves testing, connecting and evaluating all aspects of a problem or situation. Critical thinking is characterized by students' ability to collect, organize, remember, and analyze information to determine conclusions. Creative thinking is original and reflective thinking and produces a complex product. According to Krulik and Rudnick

in creative thinking students can synthesize ideas, build ideas, plan ideas and apply these ideas so that they discover and produce new products.

There are several problems related to students' reasoning in mathematics. Gunham (2014) in his study concluded that students' reasoning abilities were still low in providing explanations and evidence of a problem solving conclusion obtained. Lenola, et al. (2016) further revealed that students' reasoning abilities in solving problems were in the low category of 4%, students with medium category reasoning abilities as much as 32%, and students with high category reasoning abilities as much as 64%.

Another problem regarding the students' low reasoning abilities was expressed by Aboselem (2016), in his research he concluded that test questions designed by the teacher only measured low order thinking skills in Bloom's taxonomy, namely at the remembering level of 28.57% , understand 14.29% and apply 57.14%. while for high-ability questions, at the level of analysis, evaluation and creation are 0%.

One of the basic material in mathematics that must be mastered by elementary school students is fraction material. Good ability in fractions will help students understand other mathematical materials. As Kim (2015) said that *fraction was specifically selected as the focus of the problem because it is embedded in the content of elementary and intermediate algebra*. The reason for studying fractions is fractions are considered as the basic material for lecturing other mathematical concepts such as algebraic material and also for higher concepts.

In overcoming the problem of low student reasoning in Indonesia, the government introduced the issue of HOTS (*Higher Order Thinking Skills*). In the 2013 Curriculum HOTS type questions began to be developed with the aim of students not only being able to solve routine questions using standard formulas / algorithms, but also must be able to reason and use mathematics to solve non-routine problems encountered in daily life - day.

Minister of Education and Culture (2017) revealed that HOTS is a question that requires high-level thinking skills and involves a reasoning process, so that it can hone critical thinking skills, logical, reflective, metacognitive, and creative. The HOTS problem develops students' ability to think at the level of analysis, evaluation, and creation. (Anderson & Bloom, 2001).

HOTS questions have a big role for students, among others 1). Equip students to have skills in saving the 21st century, 2). increase student learning motivation, 3). improve the quality of questions 4). increasing love for the progress of the region. In working on the *HOTS* Question, students are expected to be able to apply the knowledge and methods that have been learned in solving a problem in a creative, innovative way to the stage of discovering an innovation / new discovery. (Minister of Education and Culture, 2018). Furthermore, Arifin (2018) explains that through *HOTS* questions students can criticize and evaluate information, make conclusions and make generalizations. Students can also create various solutions to solve problems related to everyday life.

Students' ability to solve Higher Order Thinking Skills problems is influenced by students' resilience in facing

challenges or problems. Students' responses in facing a challenge vary. Someone can solve the problem well if supported by the ability to solve good problems too. The ability that is in someone in facing a challenge or problem and looking for a solution to the problem is known as *Adversity Quotient* (AQ). According to Stoltz (2000), *Adversity Quotient* is the ability of students to survive and overcome problems. This ability includes perseverance, patience, steadfastness and is not easily discouraged in facing problems.

Stoltz (2000) revealed that *Adversity Quotient* (AQ) has four dimensions namely *Control, Original, Ownership, Reach and Endurance*. These dimensions include how a person responds to a problem. By using these four dimensions, we can see the response categories of each person in the face of difficulties. Stoltz classifies people based on their level of intelligence *Adversity Quotient* (AQ) into three groups namely *Quitter, Champer and Climber*.

Based on the background described above, the researcher wants to conduct research with the aims "**Reasoning of Elementary School Higher Order Thinking Skill (HOTS) on fraction on based on Adversity Quotient (AQ)**".

II. Methods

This research is a type of qualitative research with descriptive research methods. Student reasoning will be identified and described based on the HOTS Test results and the results of the interview based on reasoning tests. This research was conducted at SD GMTI Soe II. The subjects in this study were 5th grade students of SD GMTI Soe II. The technique in selecting subjects starts with selecting the class of prospective research subjects, followed by giving the Adversity response profile (ARP) test for grouping students in 3 types namely quitter type students, campers and climber. From the results of grouping based on ARP, the research subjects were selected consisting of one type of quitter student, camper and climber. The instruments in this study consist of two types, namely the main instrument and supporting instruments. The researcher will also observe and monitor directly the implementation of the *Higher Order Thinking Skills Test* and Questionnaire on the *Adversity Response Profile* (ARP) and interview activities with the research subjects. Supporting instruments include the *Higher Order Thinking Skills* (HOTS) Test, *Adversity Response Profile* (ARP), interview guidelines and recording devices. All supporting instruments make and the second validation process is carried out.

The interview used in this study was a semi-structured interview. This is done to get more in-depth information about students' reasoning in working on the *HOTS* Test. The data analysis technique consists of the stages of reducing data, presenting data and conclusions. The following is the Student Reasoning Indicator in solving HOTS problem :

Reasoning	Student activity	Code
-----------	------------------	------

Basic thinking	➤ Explain the information available on the question	➤ BC1
	➤ Explain the mathematical concepts that will be used in solving problems	➤ BC2
Critical Thinking	➤ Check and determine information that does not yet exist and use all information in solving a problem	➤ CL1
	➤ Determine the conclusion of a problem	➤ CL2
	➤ Arguing against problem solving	➤ CL3
Creative Thinking	➤ Plan new ideas or solutions in solving problems	➤ CV1
	➤ Applying new ideas or solutions that are different from solving previous problems	➤ CV2

III. Research Finding

a. Based on the results of the HOTS test and reasoning based interviews, it was shown that the three subjects had different reasoning abilities. *Question number one:* In commemorating the "National Awakening Day" on May 20, 2019 all delegates IV to V SD GMIT SOE II were sent to attend the ceremony at the SOE Puspenmas Field. The total number of students participating in the program is 80 people. During the ceremony there were differences in costumes used by students. There are $\frac{3}{4}$ students wearing red and white clothes, $\frac{1}{5}$ students wearing pramuka clothes, and the rest students wearing sports clothes. Determine the number of students who wear red and white clothes and sports clothes!

Then the written test results and interviews with camper type students (SCP) in completing question number 1.

P: From the matter of what you read related to what material?

SCP: fraction (BC1)

P: Why do you say it's fraction material?

SCP: Because there are characteristics of fractions (BC1)

P: what are the characteristics of fractions?

SCP: there is a numerator and denominator (BC1)

P: Look at the question, what is known from the problem?

SCP: total number of students 80, $\frac{3}{4}$ using red and white clothing $\frac{1}{5}$ uses pramuka clothes (BC2)

P: what was asked about the question?

SCP : the number of all students using red and white cloth and sports (BC2)

P: mention it information that is not yet available in the question?

SCP: many students use sports clothing (BC2)

P: how to find out many students who wear sports clothes?

SCP:

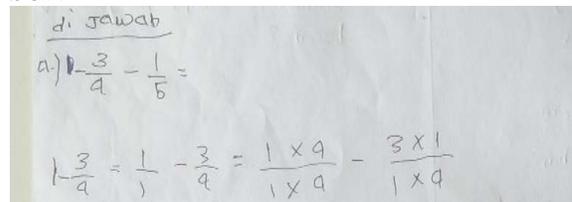

Figure 1a

P : How do you determine results $1 - \frac{3}{4} - \frac{1}{5}$?

SCP: The first step is to determine $1 - \frac{3}{4}$ then subtract with $\frac{1}{5}$

(BC2)

P: How do you change 1 into a fraction?

SCP: The fraction of 1 is $\frac{1}{1}$ so it is written $\frac{1}{1} - \frac{3}{4}$ (CL1)

P: how to equate the denominator of two fractions?

SCP : By cross-multiplying the numerator in the first fraction is multiplied by the denominator of the second fraction and the numerator in the second fraction is multiplied by the denominator of the first fraction. As well as for the denominator, the denominator of the two fractions is multiplied as in figure 1a (BC2)

P: What is the result of the reduction?

SCP: then proceed with the reduction of the third fraction to get the results $\frac{1}{20}$ (see figure 1b)

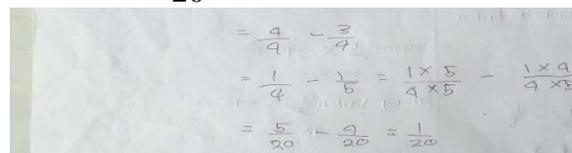

Figure 1b

P: How to determine the number of students using red and white clothes?

SCP: the way is to multiply many parts of students using red and white clothes with the total number of students (see figure 4) (BC2)

P: How to determine the number of students using sports clothing?

SCP: the way is to multiply many parts of students using sportswear with the total number of students (see figure 2) (CL1)

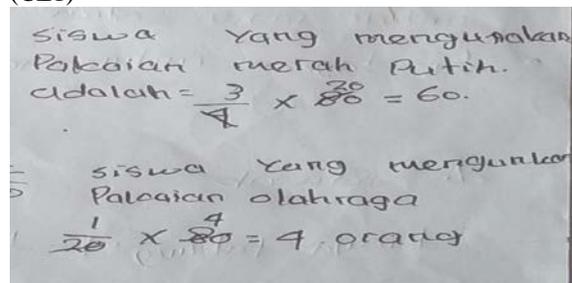

Figure 2

P: What is your conclusion?

SCP: In conclusion, there are 64 students who use red and white clothes and sports. (see figure 3)(CL2)

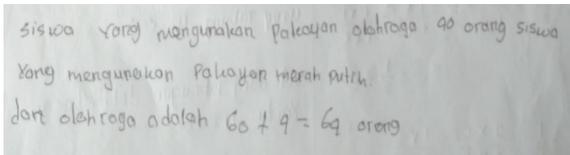

Figure 3

Based on the results of the tests written in figure 3-5 and interviews with camper type students, it was shown that students with the camper type were able to determine information that had not been provided for the existing problems, were able to do the calculation results using a reduction operation, division and multiplication of fractions with steps- step correct solution. He is able to determine the correct conclusion of the problem given and provide a logical argument. So students with camper types are able to reason well and are in the category of critical thinking. He has been able to examine the information that exists and use it in determining how to solve a problem, is able to determine the conclusions of a problem and provide an argument against solving the problem.

Camper and climber type students already have good understanding of the fractions and operations. The difference is that climber students have two different ways of determining the resolution of problem number 1. The following are the results of written tests and interviews with climber type students.

P: From the matter of what you read related to what material?

SCP: fraction (BC1)

P: Why do you say it's fraction material?

SCP: Because there are characteristics of fractions (BC1)

P: what are the characteristics of fractions?

SCB: there is a numerator and denominator (BC1)

P: Look at the question, what is known from the problem?

SCP: total number of students $90, \frac{3}{4}$ using red and white clothing $\frac{1}{5}$ uses pramuka clothes (BC2)

P: what was asked about the question?

SCP: the number of all students using red and white cloth and sports

SCP: the number of all students using red and white cloth and sports (BC2)

P: mention it information that is not yet available in the question?

SCP: many students use sports clothing (BC2)

P: how to find out many students who wear sports clothes?

SCP: Can be seen in figure 4

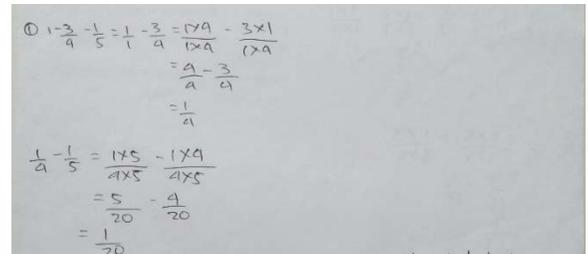

Figure 4

➤ While the difference with camper type student lies in the process of finding the number of students using red and white clothes and sports. Camper students only use one method while climber students use two ways

P: how do you determine the number of students using red and white clothes and sports?

SCB: the first way: students who wear red and white

clothes $\frac{3}{4}$ part are added to students who wear sports

clothes $\frac{1}{20}$ part (see figure 5a & 5b)

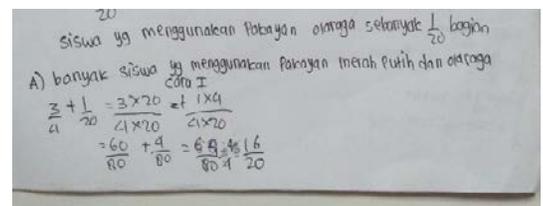

Figure 5a

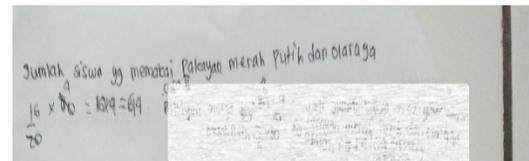

Figure 5b

So the number of students who use red and white clothes and sports is that $\frac{16}{20} \times 80 = 16 \times 4 = 64$ students

P: Do you have other ways to solve problem number 1?

SCB: Yes. Second method: students count each number of students using red and white clothing and sportswear. The

number of students who use red and white clothing is that $\frac{3}{4} \times$

total of students = $\frac{3}{4} \times 80 = 3 \times 20 = 60$ and students who wear sports clothing = $\frac{1}{20} \times 80 = 1 \times 4 = 4$ (CV1)

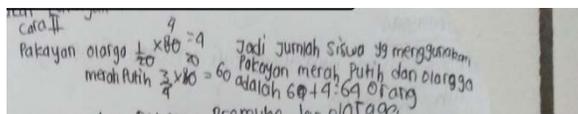

Figure 6

So the number of students using red and white clothing and sports is 64 people. (see figure 6)

P: whether the results obtained in the first way are the same in the second way

SCB: the results obtained in the first and second work methods are the same, namely the number of students using red and white clothes and sports are 64 people.

According to the results of written tests and interview transcript for climber type students, this type is able to recognize and understand the fraction concepts used to solve HOTS problems. In connection with the fraction material the climber type students are able to perform subtraction, multiplication, fraction addition operations with different denominators and operations with integers. He uses information that is on all problems, all mathematical concepts that arise and are able to connect with one another. In addition, the climber type is also able to plan new ideas or solutions in solving problems, able to apply new ideas or solutions that are different from the previous problem solving.

Following is the transcript of the interview conducted by quitter type students (SQT) in question number 1.

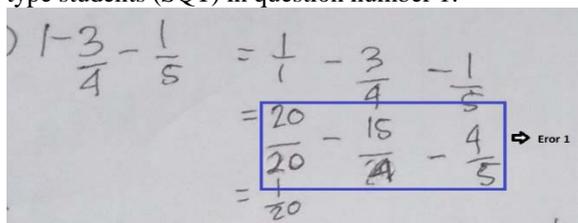

Figure 7

P: Pay attention to the shape $1 - \frac{3}{4} - \frac{1}{5}$, how to determine the result of the reduction in rupture?

SQT: By equating the denominator

P: How do you equate the denominator?

SQT: By multiplying 4 and 5, namely 20

P: What is the next step?

S: numerator First fraction: 20 divided by 20 times 1 result 20

Second fraction numerator: 20 for 4 times 5 results 15

3: 20 fraction numerator divided by 5 times 1 result 4

P: Okay, but why the value of the second and third fractions is still 4 and 5

SQT: Because the one who changes the denominator is only the first denominator (Error 1)

P: After writing the denominator in the first fraction, what should be done?

SQT: Subtract the numerator so that it gets 1/20

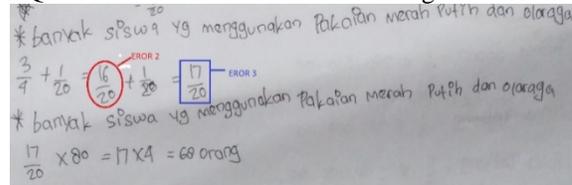

Figure 8

P: Look at the shape again $\frac{3}{4} + \frac{1}{20}$, how to add fractions with different denominators?

SQT: By equating denominators of 4 and 20, namely 20

P: How do you get 20?

SQT: Because there is a denominator of 20 in the second fraction

P: how do you get value $\frac{16}{20}$?

SQT: 20 divided by 4 multiplied by 3 = 5 x 3 = 16, so the results are fractions $\frac{16}{20}$ (error 2)

P: Is 5 x 3 = 16? (error 2)

SQL: Yes Ma'am

P: how do you get value $\frac{1}{20}$?

SQT: 20 divided by 20 times 1, so the fraction results $\frac{1}{20}$

P: Next what do you do to get the addition?

SQT: add up the numerator so that you get the results $\frac{17}{20}$ (error 3)

In Figure 7 shows that students experience difficulty in operating a form of subtraction from different denominators. This is because students think that the denominator is only in numbers that have no denominator (error 1). Then in figure 8 students experience errors in connecting the concepts of fraction division and multiplication so that the results are wrong (error 2) and also students make mistakes in doing fraction addition because the results of the multiplication obtained previously are worth the error (error 3).

In solving HOTS questions, quitter type students have not been able to understand the basic concepts in fraction material. Quitter students tend to have errors in associating fraction concepts used in solving a problem. Both errors are found to consist of errors in the process of equating the denominator of fractions with different denominators, doing land in fraction multiplication and addition operations. So the results of student

work and interviews show that the type of quitter cannot provide a good reasoning process in solving HOTS problems. This type has not achieved basic thinking skills because it has not been able to understand the basic concepts in mathematics and connects every concepts and ideas to solve HOTS problems.

Thus it can be said that the reasoning abilities of climber type students are better than quitter and camper types. Climber type reasoning abilities can be classified into the ability to think creatively because he is able to plan new ideas and is able to apply these ideas to find solutions that are different from previous solutions. While the reasoning of students with the camper type is on critical thinking skills and students with quitter types have not achieved basic thinking skills.

IV. Conclusion

Based on the results of research and discussion that has been described that students' reasoning abilities in solving HOTS problems have differences. The reasoning ability of students with the quitter type has not achieved basic thinking skills, reasoning students with the camper type are in critical thinking skills and students with the climber type are in creative abilities.

Investigation of Aloe vera extract for antimutagenicity and Antioxidant Activities

Nagma Shaheen, Dr. R.C. Agrawal

Research department, Priyamvada Birla Cancer Research Institute, Satna, India

DOI: 10.29322/IJSRP.9.08.2019.p9226
<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9226>

Abstract- In the present investigation, Antimutagenicity, antioxidant and phytochemicals investigations have been carried out. The 50% methanolic extract of Aloe vera showed the presence of Alkaloids, Carbohydrate, Resin, Saponins, Glycoside and Tanins whereas Protein, Starch, Flavonoids and Steroids were absent. The different concentration of Resin (2.5%), Tannin (1.95%), Carbohydrate (1.34%) and Alkaloids (0.67%) were quantified. In Micronucleus assay, single application of Aloe Vera ext. at the dose of 125, 250 and 375 mg/kg b.wt., 24 hours prior to the i.p. administration of Cyclophosphamide significantly prevented the micronucleus formations in bone marrow cells of mice. It was also observed that single application of Aloe vera extract at the dose of 250 mg/kg has not significantly induced micronuclei formation as compared to solvent control. The dose dependent inhibition of TBARS formation at the different concentration of Aloe vera extract ranging from 100 µg/ml to 1,000 µg/ml was studied using TBARS method. The Ascorbic acid was used as positive control. The IC₅₀ values of Ascorbic acid and of Aloe vera extract were found to be 40 µg/ml and 60 µg/ml, respectively.

Index Terms- Aloe vera; Micronucleus; Antioxidant; Phytochemicals

I. INTRODUCTION

Aloe belonging to family Liliaceae that originated in South Africa, but has been indigenous to dry subtropical and tropical climates, including the southern USA, (Reynolds et al., 1999). Aloe vera has been used for medicinal purposes in several cultures for millennia (Foster et al., 2011). There is a broad list of the therapeutic claims of different parts of Aloe vera due to its pharmacological activities which are employed in traditional management of diverse veterinary and human diseases, (Blumenthal et al., 1998). The herb is used internally to combat most digestive problems, including constipation, poor appetite, colitis, irritable bowel syndrome as well as, asthma, diabetes, immune system enhancement, peptic ulcers, (Brusick et al., 1997; Mansour et al., 2013; Ezuruike et al., 2014; Kavyashree et al., 2015; Pandey et al., 2016). Aloe vera has many biological and pharmacological activities. These effects are due to the variety of the chemical compounds including anthraquinones, glycoproteins, polysaccharides, vitamins and enzymes contained (Choi and Chung 2003; Du Plessis and Hamman 2014; Akev et al. 2015; Shrestha et al. 2015). Many of the medicinal effects have also been attributed to the immunomodulatory properties of the inner gel (Im et al. 2010), but it is also believed that synergistic action of the

compounds contained in the whole leaf extracts is responsible for the multiple and diverse beneficial properties of the plant (Eshun and He 2004). The mucilaginous gel part of A. vera is used commercially as a softener in various cosmetic preparations, soaps and shampoos due to its glycoprotein content. The first known effects of A. vera after its cathartic activity, is the wound and burn healing effect of the leaves gel portion, widely supported in scientific literature (Capasso et al. 1998; Chithra et al. 1998; Hegggers et al. 1995). Because of this effect, the gel is also added to many preparations used for skin treatment.

Material and Method

Chemicals

The leaves of Aloe vera were collected from local areas of Satna M.P. (India). Authenticated by the botanist Dr. Manoj Tripathi of Deen Dayal Research Centre, Chitrakoot, Madhya Pradesh (India), where the herbarium was deposited.

Animals:

Random bred male Swiss Albino mice of (6-8 weeks old) of 15-20 grams body weight were obtained from the animal Colony of our research centre. They were kept on synthetic pellet diet and water ad libitum. The experiment was approved by the institutional animal ethics committee before conduction of experiments.

Preparation of Aloe vera extract-

Pulp was taken out from leaves and mixed with distilled water and methanol (1:1) and kept in separating funnel for 6 hours. The supernatant was collected and this process was repeated until cleared solution of supernatant was obtained. All supernatant was pulled together and dried to the power of 40°C water bath. The powder was dissolved in double distilled water before the each treatment at required concentrations.

Preliminary Phytochemical Screening

Standard screening test for various phytochemicals of methanolic extracts of Aloe vera were carried out. The crude extracts were screened for the presence or absence for primary and secondary metabolites such as flavonoids, steroids, alkaloids, phenolic compound, saponin, tannins etc.

Investigation of Phytochemical Analysis of Aloe Vera extract Test for Phytochemical Analysis

The extracts were analyzed for the presence of various phytochemicals by applying the standard methods in 50% and 100% methanolic extract.

Test for carbohydrate

A small quantity of the extract was dissolved in 4 ml of distilled water and filtered. The Molisch's test was performed with filtrate to detect the presence of carbohydrates and further addition of Fehling's reagent if showed the brick red colour confirming the presence of reducing sugar.

Tests for glycosides

Extract was hydrolyzed with hydrochloric acid for few hours on a water bath and the hydrolysate was subjected to Legal's and Borntrager's test to detect the presence of different glycosides. Ammonia layer acquires pink colour confirming the presence of glycoside.

Test for alkaloids

A 100 mg of an extract was dissolved in dilute hydrochloric acid solution was subjected to filtration filtrate was tested with Dragendorff's and Mayer's reagents the treated solution was observed for precipitation.

Confirmatory test

Five grams of the extract was treated with 40% calcium hydroxide solution until the extract was distinctly appears alkaline to Litmus Paper, and then extracted twice with 10 ml portion of chloroform then chloroform extracts were combined and concentrated to about 5 ml. Chloroform extract then spotted on thin layer plates solvent system(n-hexane-ethyl acetate, 4:1) was used to develop chromatogram and protected by spraying the chromatograms with freshly prepared Dragendorff's spray reagent. An orange or dark colour spots against a pale yellow background was confirmatory evidence for the presence of alkaloids.

Test for proteins

2 ml of filtrate was treated with 2 ml of 10 % sodium hydroxide solution in a test tube and heat it for 10 minutes. A drop of 7% to copper sulphate solution was added in the above mixture formation of purple violet colour indicates the presence of proteins

Test for flavonoids

0.5 g of the extract dissolved in water and added with 5 ml of Ethyl acetate then shaken well and allowed to settle down. After sometime inspected for the production of yellow colour in the organic layer, which is confirmatory for free flavonoids

Lead acetate test

0.5g extract dissolved in water and mixed about 1 ml of 10% lead acetate solution. Production of yellow precipitate is considered as positive for flavonoids.

Reaction with sodium hydroxide

Salkowski's Test

0.5 g e extracts were dissolved into 2 ml of chloroform in a test tube concentrated sulphuric acid was bored on the wall of test tube to form a lower layer further examined for the appearance of

a reddish brown colour ring at the interface which indicate the presence of Steroids (i.e., the aglycone portion of the glycoside).

Lieberman's Test 0.5g extract was dissolved in 2 ml of acetic anhydride and allowed to cool in an ice-bath. Concentrated sulphuric acid was then carefully added. Purple colour turned in to blue-green which indicated the presence of a steroid nucleus, i.e., aglycone portion of the cardiac glycosides

Test for saponin

Froth test

0.5 g extracts were dissolved in 10 ml of double distilled water for about 30 seconds and shaken vigorously for about 30 seconds. The test tube was put in a vertical position and observed over 30 minutes period of time. If a "honey comb" fraud above the surface of liquid persist after 30 minutes. Frothing confirmed presence of saponin.

Test for tannins

Ferric chloride test

Some amount of the extracts were dissolved in water and solution was filtered. 10% ferric chloride solution was added to the clear filtrate and observed for change in colour to bluish black confirming the presence of chloride.

Formaldehyde test

0.5 g extract in 5 ml water, three drops of formaldehyde, and 6 drop of dilute hydrochloric acid were added and heated to boil for 1 minute, then allowed to cool. The precipitate formed(if any) was washed with hot water, warm alcohol, and warm 5% potassium hydroxide successively. A balki precipitate, which leaves a coloured Residue after washing, indicated the presence of phlobatannins.

Test for anthraquinone

0.5 gm of crude powder was taken with 10 ml of benzene and was filtered 0.5 ml of 10% Ammonia solution was added to the filtrate and the mixture was shaken well and the presence of the violet colour in the layer face indicated the presence of the anthraquinones.

Test for fixed oils

Spot test

Small quantities of plant extracts were separately present between two filter papers. Appearance of oil stain on the paper indicates the presence of fixed oil. Few drops of 0.5 N alcoholic potassium hydroxide were added to a small quantity of various extract along with a drop of phenolphthalein. The mixture was heated on a water bath for 1 to 2 hours. Formation of soap or partial neutralization of alkali indicate the presence of fixed oil and fats.

Test for phytosterol 0.5 gm of extract was treated with 10 ml chloroform and filtered. The filtered was used to test the presence of phytosterols and triterpenoids. The extract was refluxed with alcoholic potassium hydroxide solution until complete saponification. The mixture was diluted allowed by extracted with ether. Ether layer was evaporated and the residue was tested for the presence of phytosterol. The residue was dissolved in few drops of dilute acetic acid, 3 ml of acetic anhydride followed by few drops of concentrated sulphuric acid.

Appearance of bluish green colour confirms the presence of phytosterol.

II. RESULTS

The results of phytochemical screening of Hydromethanolic leaf extract of Aloe vera are depicted in table no. 4.1. The extracts

were screened for preliminary phytochemical testing to detect for the presence of different chemical group of phytochemicals. The 50 % methanolic extract of Aloe vera showed the presence of Alkaloids, Carbohydrate, Resin, Saponins, Glycoside and Tanins whereas Protein, Starch, Flavonoids and Steroids were absent (Table 1) The different concentration of Resin (2.5 %), Tannin (1.95%), Carbohydrate (1.34%) and Alkaloids (0.67%) were quantified (Table 2)

Table-1: Preliminary phyto-chemical screening of (*Aloe vera* (Linn.) (Leaf))

S. No.	Name of Experiments	Observation	Result
1.	Alkaloids		
	a) Mayer's test	Yellow colour appear	Present
	b) Wagner's test	Brown colour appear	Present
	c) Dragendorff's test	Orange colour appear	Present
2.	Carbohydrate		
	a) Anthrone's test	Dark colour appear	Present
	b) Fehling's test	Green colour appear	Present
	c) Molisch's test	No red - violet ring disapper	Present
3.	Proteins		
	a) Bieuret's test	Green colour appear	Absent
	b) Millon's test	White ppt are not appear	Absent
5.	Resins	Turbidity are seen	Present
6.	Saponins	Honey comb - like structure are form	Present
7.	Starch	Red colour is formed	Absent
8.	Flavonoid		Absent
	a) Ferric chloride test	Reddis pink colour is appear	Absent
	b) Alkaline reagent test	On addition of dilute acid yellow colour disappear	Absent
9.	Steroid		
	a) Salkowski's reaction	A red colour is disappear in the chloroform layer	Absent
10.	Glycoside		
	a) Borntrager's Test	Colour is change	Present
11.	Tannin	Greenish colour appear	Present
	a) Lead acetate Test	Reddish brown bulky ppt. are formed	Present

2. Antioxidant activity of *Aloe vera* extract using DPPH methods

The free radical scavenging capacity of the extracts of *Aloe vera* was determined using TBARS method and the data was furnished in Table 5. The stock solution of *Aloe vera* extract was prepared at the concentration of 10 mg/ml. Extent of hydroxyl radical scavenging activity was determined by decreased intensity of pink colored chromospheres in the form of IC 50 values which was determined at 532 nm. Lower IC 50 value represents higher antioxidant activity. The dose dependent inhibition of TBARS formation at the different concentration of *Aloe vera* extract ranging from 100 mg/ml to 1,000 mg/ml was studied. The Ascorbic acid was used as positive control. The IC 50 values of Ascorbic acid and of *Aloe vera* extract was found to be 40 µg/ml and 60µg/ml, respectively.

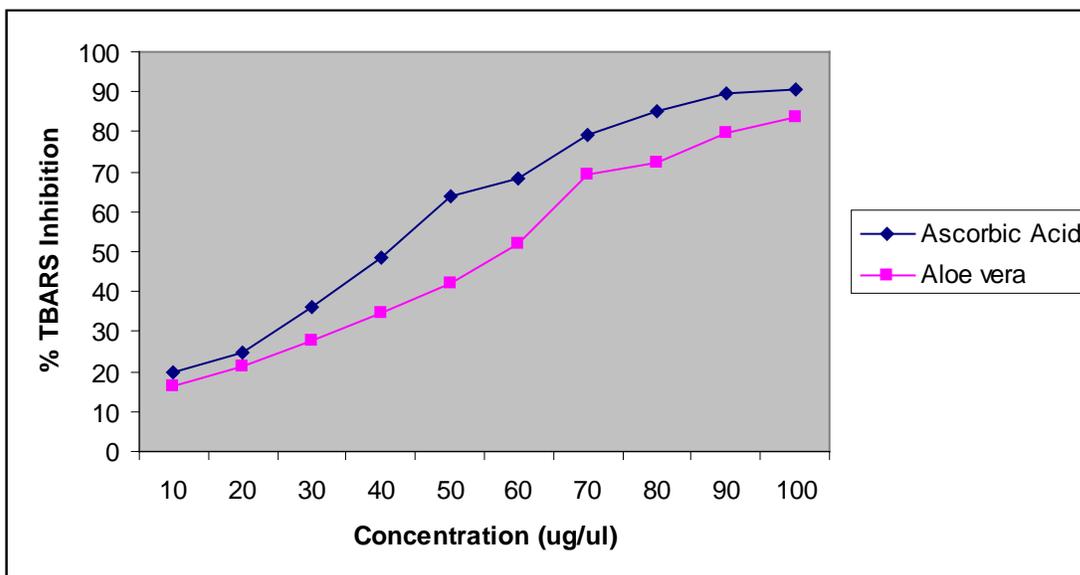

Table 4:- Antioxidant Activity of *Aloe vera*

S.No.	Concentration (ug/ ul)	Ascorbic Acid	<i>Aloe vera</i> Extract
1.	10	19.66	16.34
2.	20	24.85	21.09
3.	30	36.14	27.92
4.	40	48.41	34.75
5.	50	63.86	42.18
6.	60	68.21	51.88
7.	70	79.00	69.40
8.	80	85.35	72.17
9.	90	89.70	79.60
10.	100	90.69	83.66

3. Micronucleus assay

Single application of *Aloe Vera* ext. at the dose of 125 , 250 and 375 mg/kg b.wt.,24hours prior the i.p. administration of Cyclophosphamide (at the dose of 50 mg/kg) have significantly prevented the micronucleus formations in bone marrow cells of mice as compared to Cyclophosphamide group. It was also observed that single application of *aloe vera* extract at the dose of 250 mg/kg have not significantly induced micronuclei formation as compared to solvent control

Table no: Effect of Aloe Vera Ext. on micronucleus formation in mouse bone marrow cells:

<u>Group</u>	<u>MNPCE + SE RATIO</u>	<u>PCE/NCE RATIO</u>
Cyclophosphamide (50kg/ml)	3.5±1.1	0.99±0.08
Aloe Vera Ext. (125mg/kg body wt) + CP (50 mg/kg)	0.4±0.3	0.25±0.03
Aloe Vera Ext. (250mg/kg body wt)+ CP (50 mg/kg)	0.33±0.18*	0.30±0.01*
Aloe Vera Ext. (375mg/kg body wt)+ CP (50 mg/kg)	0.8±0.9*	0.3±0.1*
Aloe Vera Ext. Alone (250mg/kg body wt)	0.33±0.21	0.948±0.02
Solvent (Water)	0.45±0.03	0.549±0.08

III. DISCUSSION

There is a worldwide belief that herbal remedies are safer and less damaging to the human body than synthetic drugs. Our phytochemical screening of *Aloe vera* gave ideas regarding various secondary metabolites present in leaves. Phytochemical screening of the 50 % methanolic extract of *Aloe vera* showed the presence of Alkaloids, Carbohydrate, Resin, Saponins, Glycoside and Tanins whereas Protein, Starch, Flavonoids and Steroids were absent. Qualitative densitometric HPTLC fingerprint profile of methanolic extract can provide standard fingerprints and can be used as a reference for the identification and quality control of the leaves. The present study will provide the information with respect to identification and authentication of leaves.

Antioxidants are known to exhibit their biochemical effects through numerous mechanisms, including the prevention of chain initiation, reductive capacity and radical scavenging mechanisms. Several methods have been reported to measure the antioxidant activity of biological materials. In the present study, DPPH free radical scavenging activity, superoxide anion radical scavenging activity, ABTS radical scavenging activity, hydroxyl radical scavenging activity, ferric reducing antioxidant power and reducing capacity assessment were done (Deshpande et al. 2007).

Antioxidants help organisms deal with oxidative stress, caused by free radical damage. Free radicals are chemical species which contain one or more unpaired electrons due to which they are highly unstable and cause damage to other molecules by extracting electrons from them in order to attain stability. Medicinal plants often represent the only therapeutic resource for antioxidants. Lipids, proteins and DNA are all susceptible to attack by free radicals (Mondal, 2006). Antioxidants may offer resistance against oxidative stress by scavenging the free radicals, inhibiting lipid peroxidation etc. Our present study shows the antioxidant activity of *Lagenaria siceraria* extracts using DPPH method and it showed promising free radical scavenging property. Ascorbic acid was used as reference standard.

ABSTRACT

Globalization has brought fresh air into education in Indonesia because it has inspired stakeholders in education in new breakthroughs and convenience in learning process. However, it also gives impacts that should be immediately stopped in order that the danger does not widely spread. In order to overcome such negative impacts, it is necessary to have a firm attitude, which is by making *Pancasila* as a filter to every external influence and to equip students with morality so that they are not only smart in a particular science. Globalization has positive and negative impacts on education in Indonesia. In order to overcome its negative impacts on education, the quality of education in this country should be enhanced. One of the methods to enhance the quality of education is by managing education using global perspective. Education with global perspective can be divided into two, namely Curricular Perspective and Reformation Perspective. The development of education in Indonesia cannot be separated from globalization in which science and technology has developed rapidly. Free market era is also a challenge to education in Indonesia since it opens opportunities for foreign teachers and institutions to penetrate. Accordingly, policy on national education should be able to improve management of education to be more productive and efficient both in academic and non-academic matters and provide everyone with access for education as widely as possible. Thus, there are three impacts of globalization that may occur in education. First, education would become a commodity and commercial object as the neoliberalism spreads across the world. Second, the control of education from the country will be loose. Third, globalization will lead to delocation, changes in technology and educational orientation.

Keywords: ASEAN Economic Community, Education

CHAPTER I INTRODUCTION

A. Background

Globalization can be understood as changes in social and economy, combined with an establishment of unique regional and global interconnection which is more extensive and intensive than the previous period, which challenges and reforms public community and, specifically, modern countries. (Held 2000, 397). These changes involve a number of developments which can be considered as something profound that occurs in present and involves structural transformation. Such changes include human rights regime which ensures that national sovereignty is unable to guarantee a country's legitimacy in international law; environmental shift in the form of global warming due to ozone layer leakage; revolution in communication and information technology which expands its coverage and intensity of all socio-political networking tools both inside and across a nation-state's territorial border; and deregulations of capital markets which strengthen capital authorities by providing them a number of choices to exit from their relation with labor and the state.

Eventually, all the changes have the implications to the capacity of the country in implementing regulations (Held 2000, 398). Nation-states are no longer autonomous in making decision without taking other parties into consideration in regional, national, and even global context. Accordingly, globalization can be regarded as a process which transfigures itself in a transformation of organizational space from 125 relations and social transactions are assessed based on the degree of extensity, intensity, velocity and its impacts which bring transcontinentalism or interregionalism and networking activities, interactions, and exercise of power (Held 1999, 16).

B. Objective

The article aims to analyze the impacts of globalization and ASEAN Economic Community on planning the Quality-based Education in Indonesia.

C. Benefits

The benefits of the article are as follows:

1. This article can be a reference in developing science related to globalization and improvement of education quality.
2. This article can enlarge author's knowledge of globalization and improvement of education quality.

CHAPTER II DISCUSSION

A. Definition of Globalization

The term 'globalization' was first used by Theodore Levitt in 1985, which referred to politics-economy, especially free market politics and financial transaction. Historically, globalization appeared as a result of electronics revolution and disintegration of communist countries. The term 'globalization' itself is taken from the word 'global', meaning universal. It means that the scope of globalization covers the whole world. According to John Huckle, globalization is a process in which an event, a decision, or an activity in a part of the world becomes a significant consequence to individuals and society in a distant location. Meanwhile, Priyono Tjiptoherjanto argues that the concept of globalization is basically referred to the concept of borderless world. Based on this argument, globalization can be defined as a process of human integration with all aspects into a bigger unity of society.

One of the myths of globalization is that it may make the world stand for uniformity. The process of globalization will remove the identity of a nation. It is supported by a statement that, "As a process, globalization occurs through two dimensions in an interaction between nations: dimensions of space and time. Space is narrowed and time is shortened in a world-scale." (Sujiyanto, 2007:97) Therefore, some parties use globalization to refer to the decreased role or border of country.

B. Globalization and Education

1. Traditional Teaching-Learning Process: Teacher as the Centre of Science.

Education at school in the past meant teacher. The teacher acts as the center or main source in education. Even Sayling Wen said that, "a teacher can influence one's student's thought, point of view and behavior throughout his life." (Sayling Wen, 2003:100). However, since globalization entered countries in the world, including Indonesia, the position of teacher has shifted. Teacher is no longer the center of education. The development of science and technology has made changes in almost all aspects of life in which various problems can be only solved by mastering and enhancing science and technology.

2. Students are required to be active in the teaching-learning process.

The different era would require different skill and specialization of individuals. Agricultural era is an era when people worked so hard to make a living through physical works. Industrial era required standardization and did not emphasize quality or talent of individuals. However, Internet era, like nowadays, is an era which liberates qualities of people which was oppressed in the industrial era. As a result, the education system needs changing. Otherwise, learning at school would be in vain without any clear purpose and goal. Therefore, new revolutions in education system has been applied in education system in Indonesia, including changing curriculum from the 1994 curriculum, teacher as the center of learning process to Competent-Based Curriculum and School-Based Curriculum through the implementation of Active Student Learning, in which students are involved in the teaching-learning process.

3. Material Delivery with the help of computer

Globalization has impact and effect on the education system in Indonesia. Such impacts can be both positive and negative. One of the positive impacts is Multimedia Interactive Learning. As a result of globalization, the development in technology changes the pattern of teaching in the education system. The classical teaching has changed into new technology-based teaching such as using the internet and computer.

In the past, teachers wrote on the blackboard using a chalk, once in a while they would make a simple drawing or made sounds and used other simple media to deliver knowledge and information to their students. Nowadays, the availability of computers makes writing, film, sounds, music and motion pictures possible to be combined as a process of communication.

4. Student-oriented learning system: Students are taught to find concepts by themselves.

In regard to the phenomenon of balloon or spring, we can see that power can change the shape of an object. In the past, when a teacher explained about how power could change the shape of an object without using any media to explain, the students might be hard to understand what the teacher had explained. The teacher obviously would teach with examples, but listening is not as effective as seeing directly. Levie and Levie (1975) in Arsyad (2005), who reviewed previous studies of learning through word, visual and verbal stimuli, conclude that visual stimulus produces better learning results such of memorizing, recognizing, recalling and connecting facts to concepts.

Changes in Pattern of Education: The government has started to lose power control over education. Demand for competition and pressure from global institutions such as IMF and World Bank make politicians and policymakers compromise to make a change. The amendment of the 1945 Constitution of the Republic of Indonesia, Law of the National Education System and Government Regulation Number 19 of 2005 concerning National Education Standards have made changes in education paradigm from centralized to decentralized one. Schools or other educational institutions have rights to create their own curricula if they find fit with the character of their schools. Convenience in Accessing Information. The convenience of accessing information in education is as a result of the rapid development of globalization such as the internet which help students access any kind of information and knowledge and share information to one student to another especially for those who live far to each other.

Student-oriented Learning.

In the past, the curriculum was based on the progress of the teacher, but now curriculum is based on the progress of the student. Initiated in 2004 Competence Based Curriculum was a start made by the government to actively involve students in the learning process. It was then followed by School-Based Curriculum. In the class, students are required to be active in the learning process. In the past, teachers were the ones who take the authority as if they were making a speech in front of the class while the students would only listen and take notes. Now, students are allowed to express their ideas through a presentation. In addition, students are not only able to memorize, but also able to find concepts and facts by themselves.

5. Negative Impacts of Globalization on Education in Indonesia

The commercialization of education

Globalization era threatens purity in education. Many schools are established for business purposes. On his book entitled "A Perfect Future ", John Micklethwait tells about a story of business competition that starts penetrating education in which education corporations come to use 'back to the future' approach. One of the characteristics is the spirit of testing students a la Victoria which made Mr. Gradgrind happy in one of the Dickens' works. Those companies have to prove that they bring good result not only for students, but also for stakeholders. (John Micklethwait, 2007:166). In 2008, there was a case in UTS campus which indicated the deterioration of noble values in education. College degree could be earned with such an easy way without having to go through a learning process in accordance with prevailing procedure. Competing in offering breakthroughs in education, exclusive private schools are established for business purposes only because they demand considerable amount of money.

a. Danger of Cyber world

In addition to a means of accessing information, cyber world also has negative impact on students. There are a lot of negative contents on the internet such as pornography, bullying, racism, violence, and so forth. News about pedophilia and sexual harassment could be easily accessed by anyone, including students. Things such as Viagra, alcohol and drug are offered through the internet. For example, on October 6, 2009, there was a news about a girl in East Java who left during class to meet a man she knew via "Facebook". This is really dangerous for the learning process. The dependence on machines that run globalization such as computer and internet could make students and teachers addicted. As a result, teachers and students do not look enthusiastic when they do not use those media in the learning process. As previously discussed, globalization is inevitable. It always carries two different sides, which are positive impact and negative impact. The positive impact could be taken to improve education in Indonesia, while the negative impacts should be eliminated and reduced because it would be hard to completely avoid and reject them. In order to deal with negative impacts of globalization on education in Indonesia, it is necessary to have a firm attitude from education community, one of which is making Pancasila as the reference. In addition to being an ideology, Pancasila also serves as a filter. The influences that come from foreign countries will be filtered. Such influences are classified into two categories. The first category is the category that is suitable to Indonesian character and personality. This category will be received and developed in order to make the category really fit for Indonesian character and personality. The second category is the category that is not suitable with Indonesian character and personality so that it is necessary to reduce their potential danger for Indonesia. Making moral subjects as compulsory subjects. Subjects that give moral debriefing and moral improvement (such as religious subject, Pancasila and civic education subject) should become compulsory subjects while making a curriculum so that students would not only be proficient on general knowledge or on other special knowledge, but also have good manner and moral that is reflected in what they do and what they say.

I. ASEAN Economic Community (AEC) and Good Quality Education

AEC is a form of economic integrity of ASEAN in which there is a free trade system among ASEAN countries. Indonesia and other 9 ASEAN countries agreed on AEC treaty on ASEAN Summit held in Kuala Lumpur in December 1997. ASEAN leaders decided to create stable, prosperous, and highly competitive ASEAN Economic Region with equitable economic development and reduce poverty and socio-economic disparities (ASEAN Vision 2020). In the 12th ASEAN Summit in January 2007, they emphasized their full commitment to accelerate the establishment of ASEAN community in 2015 as put forward in ASEAN Vision 2020 and ASEAN Concord II, and signed Cebu Declaration on the acceleration of the Establishment of ASEAN Community in 2015. Indonesia was currently preparing for the 2015 ASEAN Economic Community (AEC). The impact of AEC is free trade market in capital, goods and services, investment, and skilled workers. Therefore, the aims of the ASEAN Economic Community (AEC) are enhancing economic stability and expected to be able to deal with economic problems within ASEAN countries. ASEAN is the third biggest economic power after Japan and China, which consisting of 10 countries, namely Indonesia, Malaysia, Philippine, Singapore, Thailand, Brunei Darussalam, Vietnam, Laos, Myanmar, and Cambodia.

ASEAN Economic Community (AEC) was established based on the agreement of ASEAN leaders in ASEAN Summit in December 1997 held in Kuala Lumpur, Malaysia. The agreement was aimed to enhance ASEAN competitiveness and to compete China and India to attract foreign investments. Foreign capital is required to create more job opportunities and enhance prosperity for ASEAN people. In the next ASEAN Summit, held in Bali in October 2003, ASEAN leaders declared that AEC would be established in 2015.

There are some impacts as a consequence of AEC:

1. Free flow goods for ASEAN countries, free flow services, free flow investment, flow of skilled workforces, and free flow capital.
2. Not only the impacts, but there are also obstructions in facing AEC:
 - a) First, low-quality education of workforces. Until February 2014, the number of workforces with junior-high school education or below was about 76.4 million people or 64 percent out of 118 million workforces in Indonesia.
 - b) Second, inadequate infrastructure availability and quality which affects the flow of goods and services.
 - c) Third, vulnerable industrial sectors because of dependency upon imported raw materials and intermediate goods.
 - d) Fourth, limited energy supply.
 - e) Fifth, Indonesia has not been able to deal with import invasion. Currently, imported products from China have been flooding Indonesia.

Ahead of AEC, the Indonesian government is supposed to be able to prepare strategic actions for workforces, infrastructure, and industrial sectors. In the AEC concept, Indonesia is selected to be the host of free trade. Therefore, the government should be ready to prepare infrastructure up to skilled, qualified, and professional human resources. In order to create skilled, qualified, and professional human resources, it is necessary to have quality education. Without quality education, the expectation to create skilled, qualified, and professional human resources will remain an expectation. The competition of workforces in AEC will be very tight. In the free trade market of AEC, Indonesia will receive a flock of foreign workforces and businesspersons from other ASEAN countries. As a matter of fact, the quality of Indonesian human resources is on average below the quality of human resources among ASEAN countries.

Without skilled, qualified, and professional human resources, Indonesia will only create blue-collar workers such as laborers and maids. Similarly, Indonesian businesspersons will become spectators in AEC that will start soon in a few months. This context certainly raises a big question. Can Indonesia be the host at home in a euphoria of AEC free trade that will start at the end of 2015? Meanwhile, to date, Indonesian government gives an unfavorable response to AEC which first was planned to start in 2020. Tight competition between workforces in AEC is inevitable. This is such a new era for Indonesian workforces. Highly competent workforces will have a considerable opportunity in gaining economic advantages. Therefore, to create skilled, high competence, qualified, and professional workforces, education plays a fundamental role in improving the quality of human resources so that they can compete with other workforces among ASEAN countries. In other words, domestic workforces will be eliminated in the competition with those from other ASEAN countries if they are not quality human resources.

According to the data from the Central Bureau of Statistics in 2013, approximately 35,88 million workforces in Indonesia only have primary and non-formal educations. It shows that the Human Development Index (HDI) in Indonesia is still low. Indonesian HDI ranks 111th out of 182 countries in the world. Meanwhile, in ASEAN, Indonesian HDI ranks 6th out of 10 ten countries. The position of Indonesian HDI is still below Philippines, Thailand, Malaysia, Singapore, and Brunei Darussalam. This shows that the quality of human resources in Indonesia has not been competitive yet. Therefore, human resources in Indonesia should be improved at least equal to those from other ASEAN countries so that they are ready for AEC and not only have opportunity to be laborers. Due to such low quality of human resources, Indonesia is deemed not ready for AEC. They need to be improved and strengthened through various skills. Skilled manpower is more prioritized than educated manpower. Educated manpower without adequate competence will be eliminated by those who are skilled and well-trained.

The importance of the Socialization of ASEAN Economic Community

Government is required to socialize AEC to public. Education and training should be held based on their characters such as hard skill and soft skill education. For example, a training of use foreign language. People also need entrepreneurship training especially who manage small medium enterprise in order to play a significant role in AEC. The most important step is to improve higher education in Indonesia so that universities in Indonesia can produce qualified graduates with international quality and professional skills. They should also possess language and intercultural skills. Language skill is essential to facilitate communication between manpower in ASEAN. In addition, it is also important to realize that possessing foreign language skill for business must not eliminate their identity of Indonesian language. Government should establish limitations of the use of foreign languages in Indonesia. They are not always necessary to be used in public.

For example, Malaysia, the neighboring country, has been massively affected by English language. However, Malaysia government has established strict policy to when the language could be used. For daily life, the government orders the society to speak their mother tongue, Malay. As a result, they still maintain their national despite using foreign language. This should be of great concern to Indonesian government. Although the ability of using foreign language is relatively low, it does not mean that Indonesian people fall behind. Therefore, it is expected that education plays a considerable role in facing AEC through formal, non-formal, and informal education. Inevitably, AEC will create impact for Indonesian citizens to achieve competence so that they can compete with other countries in ASEAN.

Strengthening Indigenous Culture

Indonesian people will encounter international interaction. Certainly, many foreign cultures will enter Indonesia. Indonesian people should be able to filter those cultures if they are negative. Therefore, it is necessary to prepare a character of Indonesia through moral education. In informal education, the role of parents and family is

required to protect Indonesian youths from moral damage. To strengthen character of the youths, training about culture and moral should be held to prepare them to face AEC in the end of 2015. It also becomes a protection from foreign culture which could eliminate Indonesians identity. By reorganizing education system in Indonesia to be better, appropriate, and qualified, it is expected that Indonesian youth generation is able to face AEC which would be applied in 2015.

Moreover, AEC does not only open trade flow in goods and services, but also market for professional manpower, such as doctors, lawyers, accountants, and so forth. Consequently, Indonesia should increase qualified manpower at home and abroad in order to prevent the invasion of foreign skilled manpower. One of the big challenges for national education is raising collective awareness that Indonesians should endeavor to achieve and compete with other countries in many aspects, one of which is competent human resources. The quality of human resources is determinant of success of development and progress of a country. Manpower from AEC countries who possess more job competence would certainly have wider opportunity to acquire economic benefits in AEC. To welcome AEC in terms of education, there are several important things to prepare:

1. Skills

It is required for Indonesians to have skills so that they can compete with foreign human resources. Therefore, skills must be possessed. People should not only accept the current results, but also have to possess all skills. If they do not have skills, Indonesians will only become consumers in their own country. For those who are in productive age, qualified skills are required to compete in ASEAN countries.

2. Knowledge

Knowledge is the second important aspect to face ASEAN Economic Community. It is essential to reinforce competence in particular fields and to stay focus upon works. Therefore, each person needs to master at least one of the disciplines, for example general practitioners. It would be better for general practitioners, or doctors who do not specialize in one particular area of medicine, to proceed to medical specialists, or doctors who have undertaken specialized medical studies, so that they would be able to focus upon one specific area of medicine. Not only does this apply to doctors, but also applies to other people working on different fields.

3. Experience

Experience is the last aspect to face ASEAN Economic Community. It is said that experience is a ladder to success. Successful people should have numerous organizational and working experience. To put it in a nutshell, if 200 university graduates in Indonesian Language and Literature whose GPA is 3.5 on average apply for a job at educational institutions, those who will probably be shortlisted are those who have a lot of experience from their former universities. University graduates who were engaged in many organizations tend to have considerable experience, outstanding leadership, and increasing maturity. As Indonesian citizens, we need to develop these three qualities to be able to compete in the ASEAN Economic Community. Otherwise, we will only become spectators in our home country.

CHAPTER III CONCLUSION

A. Conclusion

Globalization is a gradual process which is indicated by indistinct state borders. The world looks like a housing complex in which information can spread very quickly. Not only does globalization appear in economic, technology, communication, transportation and political sector, but it is obvious to occur in education sector as well. Globalization inspires education community to achieve significant breakthrough and provide easy access to education. However, it has negative effects which should be prevented from spreading widely. One of the ways to prevent the negative effects of globalization is increasing the values of Pancasila to separate foreign influence out and to provide moral provisions to students because they need to be smart as well as having excellent moral character. Upon education, globalization has both positive and negative effects. To overcome the negative effects of globalization, it is necessary to improve the quality of education. It can be achieved by managing education considering global awareness and perspective. There are two types of global perspective in education: (1) curricular perspective; and (2) reformation perspective. The development of education in Indonesia cannot be separated from the influence of globalization in which science and technology grow rapidly. In addition to globalization, free market also emerges as a challenge to education in Indonesia since it provides opportunity for overseas educational institutions and teachers to come to Indonesia. Hence, policies should be made in order to face global market, some of which are (1) improving the quality of education, both academically and non-academically; (2) setting up more productive and more efficient management of education; and (3) providing considerable amount of opportunities for people to access education. There would be at least three effects of globalization in education sector. First, education would be a commodity and a commercial object as neoliberalism get stronger in the world. Second, the state would no longer have absolute control over education. Third, globalization would stimulate delocation, technology changes and educational orientation.

One of the most important things that our nation needs to prepare is experienced human resources because the quality of human resources determines success and development of a country. Manpower from ASEAN Economic Community countries who demonstrate great competence may get more opportunity for economic benefits from the community. In terms of education, there are several things that should be prepared. First, every citizen of the Republic of Indonesia should have considerable skills so that they will be able to compete with foreign citizens. Second, every citizen

should also acquire comprehensive knowledge relating to their chosen field. Comprehensive knowledge may support them in maintaining their focus. Third, Experience is the last important thing that needs to be prepared for it is said that experience is a ladder to success. Successful people should have numerous organizational and working experience. Indonesian citizens should develop these three qualities to be able to compete in ASEAN Economic Community. Otherwise, we will only become spectators in our home country.

B. Suggestions

The government of the Republic of Indonesia may take major steps in finding problems as well as offering solutions about education in Indonesia, one of which is providing excellent yet affordable education. Some regions in the Republic of Indonesia have provided free-tuition excellent education, but this regulation applies only to certain areas. Therefore, the Central Government of the Republic of Indonesia should also put the regulation into operation on a national scale. The Central Government, however, should eliminate unnecessary bureaucracy and corruption because they are two among other things that could put an end to our nation. Mohammad Nuh, the former Minister of Education of the Republic of Indonesia, said that education should outlaw discrimination emerging out of social gap between the rich and the poor because of distinctive factors between communities in cities and rural areas which prevented them from pursuing education (kompas.com, 3 November 2009). This should be implemented as soon as possible to fulfil the rights of every citizen of the Republic of Indonesia to get proper education and to encourage educational institutions to take low price methodologies and curricula into consideration.

Abstract This paper is on the proof of the Sendov's conjecture for polynomials of degree 10. Sendov's conjecture deals with the location of roots and critical points of polynomials of complex variables. To prove it for polynomials of degree 10 is the central part of the paper.

Subject classification code (MSC 2010):30C15

Index Terms- Extremal Polynomials, Critical points, Derivatives, Complex Polynomials

I. INTRODUCTION

P_n is monic Polynomial of degree $n \geq 2$ of the form $p(z) = \prod_{k=1}^n (z - z_k)$, $|z_k| \leq 1$ ($k = 1, 2, \dots, n$) With
 $p'(z) = n \prod_{j=1}^{n-1} (z - \zeta_j)$, $|\zeta_j| \leq 1$ ($j = 1, 2, \dots, n-1$)

Write $I(z_k) = \min_{1 \leq j \leq n-1} |z_k - \zeta_j|$, $I(p) = \max_{1 \leq k \leq n} I(z_k)$ and $I(P_n) = \sup_{p \in P_n} I(p)$

It was showed By Brown that there exists an extremal polynomial p_n^* , i.e., $I(p_n) = I(p_n^*)$ and that p_n^* has at least one zero on each sub arc of the unit circle of length π

It is enough to prove the Sendov conjecture assuming p is an extremal polynomial of following form

$$p(z) = (z-a) \prod_{k=1}^{n-1} (z - z_k), |z_k| \leq 1 \quad (k = 1, 2, \dots, n-1)$$

Sendov's conjecture

If $P(z) = \prod_{k=1}^n (z - z_k)$ is a polynomial with all its zero's inside the closed unit disk then each of the disks $|z - z_k| \leq 1$ ($k = 1, 2, \dots, n$) must contain zero of p' With

$$p'(z) = n \prod_{j=1}^{n-1} (z - \zeta_j), |\zeta_j| \leq 1 \quad (j = 1, 2, \dots, n-1) \quad a \in [0, 1]$$

Let $r_k = |a - z_k|$, $\rho_j = |a - \zeta_j|$ for all $k, j = 1, 2, 3, \dots, n-1$

We suppose $\rho_1 \leq \rho_2 \leq \dots \leq \rho_{n-1}$ and $r_1 \leq r_2 \leq \dots \leq r_{n-1}$

We have form [3]

$$2\rho_1 \sin\left(\frac{\pi}{n}\right) \leq r_k \leq 1 + a, \quad k = 1, 2, \dots, n-1.$$

Theorem for $n=10$

The polynomial $p(z)$ has a critical point in the disk $|z-a| \leq 1$

In this paper we assume that $z_k \neq a$ for $k=1, 2, 3, \dots, n-1$ and $p(z)$ is the extremal form

$$I(p_n) = I(p) = I(a) = \rho_1$$

In this paper we need to prove the theorem for $a > 0.845$

1. Lemmas from references

In this section I will present few lemmas but not the proof as the proofs are present in the reference given in the reference section

Lemma 1

If $1 - (1 - |p'(0)|)^{1/n} \leq \lambda \leq \sin\left(\frac{\pi}{n}\right)$ and $\lambda < a$, $\rho_1 \geq 1$ then there exist a critical point $\zeta = a + \rho_0 e^{i\theta}$ such that

$$\operatorname{Re} \zeta^0 \geq \frac{1}{2} \left(a - \frac{\lambda(\lambda+2)}{a} \right).$$

Proof: Theorem 1 of [2]

Lemma 2

For $\rho > 0$ we have

$$\prod_{r_k \geq \rho} r_k \rho^{-1} \leq \prod_{\rho_k \geq \rho} \rho_j \rho^{-1} \prod_{2 \sin \frac{\pi k}{n} \geq 1} 2 \sin \frac{\pi k}{n}$$

This is theorem 3 of [2] by taking m=1

Lemma 3

If $c_k [k=1,2,\dots,N]$ m,M,c are positive constants with $m \leq c \leq M$, $\prod_1^N r_k \geq$ and $m^N \leq c \leq M^N$ then

$$\sum_{k=1}^N \frac{1}{r_k^2} \leq \frac{N-v}{m^2} + \frac{v-1}{M^2} + \left\{ \frac{m^{N-v} M^{v-1}}{c} \right\}$$

Proof: Lemma B of [2]

Lemma 4

$$\prod_{k=1}^{n-1} r_k = n \prod_{j=1}^{n-1} \rho_j$$

Proof: see [3]

Throughout this paper we let

$$\gamma_j = \frac{\zeta_j - a}{a \zeta_j - 1} \quad w_k = \frac{z_k - a}{a z_k - 1}$$

Now we take the assumption, the general form of assumption can be written as

$$\prod_{j=1}^{n-1} |\gamma_j| \leq \frac{\prod_{k=1}^{n-1} |w_k|}{n - \frac{4a^2}{1+a^2} - a \sum_{k=1}^{n-3} R e w_k}$$

For n=10 the assumption becomes

$$\prod_{j=1}^{n-1} |\gamma_j| \leq \frac{\prod_{k=1}^{n-1} |w_k|}{n - \frac{4a^2}{1+a^2} - 7a}$$

This assumption holds which can be checked easily

Next lemma is the last lemma in the reference Lemma section I have skipped Lemma 5 which will be presented in next section

Lemma 6: If

$$|\gamma_j| < \frac{1}{1+a+a^2} \text{ then } \rho_j \leq 1$$

Proof: see Lemma 1 of [4]

We can write Lemma 6 as

$$\prod_{j=1}^M |\gamma_j| < \frac{1}{(1+a+a^2)^M}$$

2. Lemmas with proof

Lemma 5: $\rho_1 > 1$, $\zeta_0 = a + \rho_0 e^{i\theta_0}$ is the critical point in Lemma 1

$$\gamma_0 = \frac{\zeta_0 - a}{a \zeta_0 - 1} \text{ then}$$

$$|\gamma_0| > \frac{1}{\sqrt{1+\lambda(\lambda+2)-a^2\lambda(\lambda+2)}}$$

Proof:

$$|\gamma_0|^2 = \frac{\rho_0^2}{a^2|\zeta_0|^2 - 2a\operatorname{Re}\zeta_0 + 1}$$

$$\operatorname{Re}\zeta_0 \geq \frac{1}{2}\left(a - \frac{\lambda(\lambda+2)}{a}\right) \text{ hence}$$

$$\rho_0 \cos\theta_0 \geq \frac{-1}{2}\left(a + \frac{\lambda(\lambda+2)}{a}\right)$$

$$|\gamma_0|^2 = \frac{\rho_0^2}{a^4 - 2a^2 + 1 + a^2\rho_0^2 + 2a(a^2 - 1)\rho_0 \cos\theta_0}$$

$$|\gamma_0|^2 = \left|\frac{\zeta_0 - a}{a\zeta_0 - 1}\right|^2$$

$$|\gamma_0|^2 = \frac{\rho_0^2}{a^4 - 2a^2 + 1 + a^2\rho_0^2 + 2a(a^2 - 1)\rho_0 \cos\theta_0} \geq \frac{\rho_0^2}{a^4 - 2a^2 + 1 + a^2\rho_0^2 + (1 - a^2)(a^2 + \lambda(\lambda + 2))} \geq \frac{1}{1 + \lambda(\lambda + 2) - a^2\lambda(\lambda + 2)}$$

$$|\gamma_0|^2 > \frac{1}{1 + \lambda(\lambda + 2) - a^2\lambda(\lambda + 2)}$$

Which proves the above lemma

Lemma 7

If $a \in [0.846, 1]$ and there exist $|z_k| \leq 0.56$ then $I(a) = \rho_1 \leq 1$

Proof: If $I(a) > 1$ and there exist $|z_k| \leq R$ then by then by above equation and lemma 5 there exists some γ_{j_0}

$$\frac{|\gamma_{j_0}|^8}{\sqrt{1 + \lambda(\lambda + 2) - a^2\lambda(\lambda + 2)}} \leq \prod_{j=1}^9 |\gamma_j| \leq \frac{B}{10 - \frac{4a^2}{1+a^2} - 7a}$$

Hence

$$|\gamma_{j_0}|^8 \leq \frac{\sqrt{1 + \lambda(\lambda + 2) - a^2\lambda(\lambda + 2)}}{9 - \frac{4a^2}{1+a^2} - 7a} B$$

By lemma 6 it suffices to show

$$\left(10 - \frac{4a^2}{(1+a^2)} - 6a\right) \frac{aR+1}{R+a} - \sqrt{1 + (1 - a^2)\lambda(\lambda + 2)} (1+a-a^2)^8 \geq 0$$

Considering following condition for λ

$$p(0) = a \prod_{k=1}^9 |z_k| \leq aR$$

$$1 - (1 - |p(0)|)^{\frac{1}{10}} \leq \lambda \leq \sin\left(\frac{\pi}{10}\right)$$

$$\lambda = 1 - (1 - aR)^{\frac{1}{10}}$$

And R satisfies $R \leq a^{-1}(1 - (1 - \sin(\pi/10))^{10})$

=

We have

$$\frac{p'(0)}{p(0)} = -\left(\frac{1}{a} + \sum_{k=1}^9 \frac{1}{z_k}\right)$$

$$\text{And } 10 \prod_{j=1}^9 |\zeta_j| = \left(a \prod_{j=1}^9 |z_k|\right) \left|\frac{1}{a} + \sum_{k=1}^9 \frac{1}{z_k}\right|$$

$$\text{Let } \Delta = \operatorname{Re} \left(\frac{1}{a} + \sum_{k=1}^9 \frac{1}{z_k} \right) \sigma = \sum_{k=1}^9 \frac{1}{r_k^2}$$

$$\text{Then } 10 \prod_{j=1}^9 |\zeta_j| \geq -a \prod_{k=1}^9 |z_k|$$

Lemma 8

If $\rho_1 > 1$, $a \in [0.846, 1]$ and $|z_k| \in [0.56, 1]$ $k=1, \dots, 10$ then

$$\Delta \leq \frac{-9}{8} + 9a + \frac{10}{9} (1 - a^2) \sigma$$

Proof: $z_k = |z_k|e^{i\theta_k} = a + \rho_j e^{it_j}$ $1 \leq k$ by Lemma 3.2 of [3] we have

$$\Delta = \frac{1}{a} + \operatorname{Re} \sum_{k=1}^9 z_k + \sum_{k=1}^9 \frac{1 - |z_k|^2}{|z_k|} \cos \theta_k$$

$$\Delta = \frac{1 - a^2}{a} + \frac{10}{9} \operatorname{Re} \sum_{j=1}^9 \zeta_j + \sum_{k=1}^9 \frac{1 - |z_k|^2}{|z_k|} \cos \theta_k$$

$$\sum_{k=1}^9 \frac{|z_k|^2 - a^2}{r_k^2} = 9 + a \sum_{j=1}^9 \frac{\cos \theta_j}{\rho_j}$$

Since $\rho_j > 1$ we deduce $\cos \theta_j \leq 0$

$$\sum_{k=1}^9 \frac{|z_k|^2 - a^2}{r_k^2} \geq 9 + a \sum_{j=1}^9 \frac{\cos \theta_j}{\rho_j}$$

$$\text{But } \operatorname{Re} \sum_{j=1}^9 \zeta_j = 9a + \sum_{j=1}^9 \rho_j \cos \theta_j \leq 9a + \sum_{j=1}^9 \cos \theta_j$$

Hence

$$\operatorname{Re} \sum_{j=1}^9 \zeta_j = a - \frac{9}{a} + \frac{1}{a} \sum_{k=1}^9 \frac{|z_k|^2 - a^2}{r_k^2}$$

And by value of Δ we obtained in the previous equation of this lemma

$$\Delta \leq 9a - \frac{9}{a} + \sum_{k=1}^9 \left(\frac{10 |z_k|^2 - a^2}{9a r_k^2} + \frac{1 - |z_k|^2 \cos \theta_k}{|z_k|} \right)$$

To prove

$$\frac{10 |z_k|^2 - a^2}{9a r_k^2} + \frac{1 - |z_k|^2 \cos \theta_k}{|z_k|} \leq \frac{10}{9} \frac{1 - a^2}{r_k^2}$$

If $\cos \theta_k \leq 0$ above equation is valid

Assume $\cos \theta_k > 0$ and write $x = |z_k|$, $\theta = \theta_k$

Then

$$r_k^2 = a^2 + x^2 - 2ax \cos \theta$$

We want to show

$$x^2 + \frac{9a(1-x^2)(a^2+x^2-2ax\cos\theta)\cos\theta}{10x + \frac{(1-x^2)(a^2+x^2)}{10x^2}} \leq 1$$

It is enough to prove $x^2 + \frac{(1-x^2)(a^2+x^2)}{10x^2} \leq 1$
 For $a \in [0.846, 1]$ $x \in [0.56, 1]$ this is true by Lemma 3.8 of [3] the lemma follows

Lemma 9

Let $m=2/9$, $a \in [0.846, 1]$

$$f(x) = \frac{x^2-1}{(1-x^m)(x+a)^2} \text{ then } f'(x) > 0 \text{ for } x \in [0.56, 1]$$

Proof

$$\text{We have } f'(x) = \frac{Y}{(1-x^m)^2(x+a)^3}$$

$$Y = (m-2)x^{m-1} - mx^{m-1} + 2x)a + mx^{m+2} - (2+m)x^m + 2$$

If $Y=0$ we will obtain $a > 1$ for $x \in [0.56, 1]$ hence $Y \neq 0$ for $a \in [0.846, 1]$ $x \in [0.56, 1]$ when $a=x=0.9$

$Y > 0$ and the Lemma follows

Lemma 10

If $\rho_1 \geq 1$ we have the general form $\prod_{j=1}^{n-1} \zeta_j \leq (\prod_{j=1}^{n-1} \rho_j) [a^2 - 1 + (\frac{2}{n-1}) \{ \sum_{k=1}^{n-1} \frac{|z_k|^2 - a^2}{r_k^2} \}]^{\frac{n-1}{2}}$

For $n=10$ the general form becomes

$$\prod_{j=1}^9 \zeta_j \leq \left(\prod_{j=1}^9 \rho_j \right) [a^2 - 1 + \binom{2}{9} \left\{ \sum_{k=1}^9 \frac{|z_k|^2 - a^2}{r_k^2} \right\}]^{\frac{9}{2}}$$

Applying the following identities

$$\sum_{j=1}^{n-1} \frac{1}{a - \zeta_j} = \sum_{k=1}^{n-1} \frac{2}{a - z_k}$$

Let $r_k = |a - z_k|$ and $\rho_j = |a - \zeta_j|$ for $k = 1, 2, 3, \dots, n - 1$

$$\operatorname{Re} \left\{ \frac{1}{a - w} \right\} = \frac{1}{2a} - \frac{|w|^2 - a^2}{2a|a - w|^2}$$

It can be easily verified that this is true

$$\sum_{j=1}^9 \frac{a^2 - |\zeta_j|^2}{\rho_j^2} = 9 + 2 \sum_{k=1}^9 \frac{a^2 - |z_k|^2}{r_k^2}$$

And since $\rho_j \geq 1$ for $j=1, 2, 3, \dots, n-1$

$$\sum_{j=1}^9 \frac{|\zeta_j|^2}{\rho_j^2} \leq 2 \sum_{k=1}^9 \frac{|z_k|^2 - a^2}{r_k^2} - 9(1 - a^2)$$

Apply Arithmetic geometric inequality

$$\prod_{j=1}^9 \frac{|\zeta_j|}{\rho_j} = \left(\prod_{j=1}^9 \frac{|\zeta_j|^2}{\rho_j^2} \right)^{\frac{1}{2}} \leq \left[\left(\frac{1}{9} \sum_{j=1}^9 \frac{|\zeta_j|^2}{\rho_j^2} \right)^9 \right]^{\frac{1}{2}} \leq \left[\frac{2}{9} \sum_{k=1}^9 \frac{|z_k|^2 - a^2}{r_k^2} - (1 - a^2) \right]^{\frac{9}{2}}$$

$$\prod_{j=1}^9 \zeta_j \leq \left(\prod_{j=1}^9 \rho_j \right) [a^2 - 1 + \binom{2}{9} \left\{ \sum_{k=1}^9 \frac{|z_k|^2 - a^2}{r_k^2} \right\}]^{\frac{9}{2}}$$

Hence the Lemma is proven

We will use the condition given below

$$\frac{x^2 - 1}{(1 - x^m)(x + a)^2} + (1 - a^2) \left(\sigma - \frac{9}{2} \right) \leq 0$$

$x \in [0.56, 1]$ and $a \in [0.85, 1]$

Lemma 11

If $\sigma > 9/2$ $\rho_1 > 1$ above condition holds with $m=2/9$

And $z_k \in [0.56, 1]$ $k=1, 2, 3, \dots, 9$ then

$$\frac{9}{2} \left(9 - \frac{10}{9} \sigma \right) (1 - a^2)^{-3} \leq \left(\sigma - \frac{9}{2} \right)^{\frac{9}{2}} 10 \sum_{j=1}^9 \rho_j$$

Proof

By lemma 8 and 10

$$(9 - 9a^2 - \frac{10}{9}(1 - a^2)\sigma) \sum_{k=1}^9 |z_k| \leq 10(\prod_{j=1}^9 \rho_j) [a^2 - 1 + (\frac{2}{9})\{\sum_{k=1}^9 \frac{|z_k|^2 - a^2}{r_k^2}\}]^{\frac{9}{2}}$$

Write
 Write $x=|z_k|$, $z_k=xe^{i\theta}$

$$\Phi = a^2 - 1 + (\frac{2}{9})\{\sum_{k=1}^9 \frac{|z_k|^2 - a^2}{r_k^2}\}(\prod_{k=1}^9 z_k)^{\frac{-2}{9}}$$

$$(9 - 9a^2 - \frac{10}{9}(1 - a^2)\sigma) \leq 10(\prod_{j=1}^9 \rho_j) \Phi^{\frac{9}{2}}$$

$$\alpha = a^2 + x^2 - 2ax\cos\theta$$

$$\alpha = a^2 - 1 + \frac{2}{9} \sum_{l \neq k} \frac{|z_l|^2 - a^2}{r_l^2}$$

We will show $\alpha + \frac{2(x^2 - a^2)}{9} x^{\frac{-2}{9}} \leq \alpha + \frac{2(1 - a^2)}{9r_k^2}$ that is

$$\frac{x^2 - x^m}{1 - x^m} - a^2 + 4\alpha r_k^2 \leq 0$$

Since

$$\alpha \leq a^2 - 1 + \frac{1}{4} \sum_{l \neq k} \frac{1 - a^2}{r_l^2} \leq a^2 - 1 + \frac{2}{9}(1 - a^2)\sigma - \frac{2(1 - a^2)}{9r_k^2}$$

And $r_k < a+x$ it is sufficient to have $\frac{x^2 - 1}{(1 - x^m)(x+a)^2} + (1 - a^2)(\sigma - \frac{9}{2}) \leq 0$

For $\sigma > \frac{9}{2}$ we obtain $\alpha + \frac{2(x^2 - a^2)}{9} x^{\frac{-2}{9}} \leq \alpha + \frac{2(1 - a^2)}{9r_k^2}$

Applying above equation 9 times we have

$$\Phi \leq \frac{2(1 - a^2)(\sigma - \frac{9}{2})}{9}$$

Using inequality $(9 - 9a^2 - \frac{10}{9}(1 - a^2)\sigma) \leq 10(\prod_{j=1}^9 \rho_j) \Phi^{\frac{9}{2}}$

The lemma follows

$$\mu^*(a) \leq U^*(a)$$

$$\mu^*(a) \equiv \sum_{k=1}^{n-1} \frac{1}{r_k^2}$$

$$R_k = r_k \prod_{j=1}^{k-1} r_j^{-\frac{1}{9}} \text{ for } k = 1, 2, \dots, n - 1$$

$$U^*(a) = (9 - v^*) \left(\frac{2\sin \frac{\pi}{10}}{1+a}\right)^{-16} + (v^* - 1) \left(\frac{1+a}{10^9}\right)^{-2} + \left\{ \left(\frac{2\sin \frac{\pi}{10}}{1+a}\right)^{\frac{16}{9}} (9 - v^*) \left(\frac{1+a}{10^9}\right)^{v^*-1} \right\}^2$$

Where $v^* = \min\{j \in \mathbb{Z}; j \geq \lceil \{8 \log \left(\frac{1+a}{2\sin \frac{\pi}{10}}\right)\} (\log \left\{ \frac{(1+a)^{\frac{25}{9}}}{10^9 2\sin \frac{\pi}{9}} \right\})^{-1} \rceil \}$

Lemma 12

If $\rho_1 > 1$ then $\sum_{k=1}^9 \frac{1}{R_k^2} \leq U^*(a)$

proof

We have $\prod_{k=1}^9 R_k = 1$

$$\left(\frac{2\sin\frac{\pi}{10}}{1+a}\right)^{\frac{16}{9}} \leq R_k \leq \frac{1+a}{10^{\frac{1}{9}}}$$

Taking $N=9$ $C=1$ $m=\left(\frac{2\sin\frac{\pi}{10}}{1+a}\right)^{\frac{16}{9}}$ $M=\frac{1+a}{10^{\frac{1}{9}}}$ $C_k=R_k$ in $\sigma \leq U^a$

Where

$$U(a) = (9-v)(2\sin\frac{\pi}{10})^{-2} + (v-1)(1+a)^{-2} + \{(2\sin\frac{\pi}{10})^{9-v}(1+a)^{v-1}10^{-1}\}^2$$

$$v = \min\{j \in \mathbb{Z}: j \geq \log\{10(2\sin\frac{\pi}{10})^{-9}\}\{\log(1+a)(2\sin\frac{\pi}{10})^{-1}\}^{-1}\}$$

Lemma 13

if $\rho_1 > 1$ $\frac{9}{2} < \sigma \leq U(a) < \frac{(n-1)^2}{n}$

$$\frac{9}{2} < \sigma \leq U(a) < \frac{81}{10}$$

$$\frac{\frac{9}{2}U(a) - 9 - \frac{10}{9}U(a)}{U(a) - \frac{9}{2}} \left(\frac{1}{(1-a^2)^3}\right)^{\frac{1}{4}} \leq U^*(a)$$

Let $a \in [0.56, 0.96]$

$$\lim_{x \rightarrow 1-0} \frac{x^2 - 1}{(1-x^m)(x+a)^2} + (1-a^2)\left(\sigma - \frac{9}{2}\right) \leq 0$$

That is $\sigma \leq \frac{9}{2} + \frac{9}{(1+a)(1+a)^3}$ this is true for $\sigma < \frac{81}{10}$

Now by previous lemmas

$$9^{\frac{9}{2}}\left(9 - \frac{10\sigma}{9}\right)(1-a^2)^{-3} \leq \left(\sigma - \frac{9}{2}\right)^{\frac{9}{2}} 10 \prod_{j=1}^9 \rho_j$$

$$9^{\frac{9}{2}}\left(9 - \frac{10\sigma}{9}\right)(1-a^2)^{-3} \leq \left\{10 \prod_{j=1}^9 \rho_j\right\}^{\frac{2}{9}} \sigma - \frac{9}{2} \left\{10 \prod_{j=1}^9 \rho_j\right\}^{\frac{2}{9}}$$

$$\sum_{k=1}^9 \frac{1}{R_k^2} - \frac{9}{2} \left\{10 \prod_{j=1}^9 \rho_j\right\}^{\frac{2}{9}} \leq \left\{U^*(a) - \frac{9}{2}\right\} \left\{10 \prod_{j=1}^9 \rho_j\right\}^{\frac{2}{9}}$$

Using Lemma 11

$$\left[\left(9 - \frac{10\sigma}{9}\right)^{\frac{2}{9}}(1-a^2)^{-\frac{7}{9}} \leq \frac{2}{9}U^*(a) - \frac{9}{2}\left(9 - \frac{10\sigma}{9}\right)^{\frac{2}{9}}(1-a^2)^{-\frac{7}{9}}\left(\sigma - \frac{9}{2}\right)^{-1}\right]$$

Hence the Lemma follows

Proof of theorem

This is the main part of the paper here we prove the sendov conjecture for suppose $n=10$ We want a new upper bound to $U(a)$

$$n_1 = \#\{z_k: r_k < 1\}, n_2 = \#\{z_k: r_k \geq 1\}$$

$$n_1 + n_2 = 10$$

$$q = \prod_{r_k < 1} r_k, \sigma = \sum_{k=1}^9 \frac{1}{r_k^2} = \sum_{r_k < 1} \frac{1}{r_k^2} + \sum_{r_k \geq 1} \frac{1}{r_k^2} = \Sigma A + \Sigma B$$

Where $\Sigma A = \sum_{r_k < 1} \frac{1}{r_k^2}$, $\Sigma B = \sum_{r_k \geq 1} \frac{1}{r_k^2}$

Suppose $\rho_1 > 1$ by using Lemma 13 and the new upper bound of $U(a)$ we will get contradiction

If $\rho_1 > 1$ taking $\rho = 1$ in Lemma 2 we have

$$\prod_{r_k \geq 1} r_k \leq \prod_{j=1}^9 \rho_j \prod_{2\sin\frac{\pi k}{10} \geq 1} 2\sin\frac{\pi k}{10}$$

By Lemma 4

$$10 \leq \prod_{r_k < 1} r_k \prod_{2 \sin \frac{\pi k}{10} \geq 1} 2 \sin \frac{\pi k}{10}$$

Hence

$$q \geq 10 \left(\prod_{2 \sin \frac{\pi k}{10} \geq 1} 2 \sin \frac{\pi k}{10} \right)^{-1} = \left(2 \sin \frac{\pi}{10} \right)^2$$

By Lemma 4 in the sum $\sum B$ we have

$$\prod r_k \geq 9q^{-1}$$

$rk \geq 1$

In the sum $\sum A$, we have

$$\prod r_k = q < 1$$

$rk < 1$

By Lemma 4 and other equations we obtain

$$\prod_{k=1}^9 r_k = 9 \prod_{j=1}^9 \rho_j > 9$$

Then

$$2n^2 \geq (1+a)^2 > 9$$

Hence

$$n_2 \geq 4 \text{ and } n_1 < 4$$

We will consider four subcases for $n_1, a \in [0.846, 1)$.

(i) $n_1 = 0, n_2 = 9$

$$\sum A = 0 = U_A \text{ say}$$

In the sum $\sum B$ We have $1 \leq r_k \leq 1+a$ Hence by Lemma 3

$$\sum B \leq n_2 - v_1 + \frac{v_1 - 1}{(1+a)^2} + \left\{ \frac{(1+a)^{v_1-1}}{10} \right\}^2 = U_B \text{ say}$$

where $v_1 = \min\{j \in \mathbb{Z}: (1+a)^j \geq 10\}$

$$U(a) = U_A + U_B$$

Using the bound of $U(a)$, we get the contradiction to Lemma 13

(ii) $n_1 = 1, n_2 = 8$

$$\sum A = q^{-2} = U_A \text{ say}$$

In the sum $\sum B$ We have $1 \leq r_k \leq 1+a$ Hence by Lemma 3

$$\sum B \leq n_2 - v_1 + \frac{v_1 - 1}{(1+a)^2} + \left\{ \frac{(1+a)^{v_1-1}}{10 q^{-1}} \right\}^2 = U_B \text{ say}$$

where

$$v_1 = \min\{j \in \mathbb{Z}: (1+a)^j \geq 10q^{-1}\}$$

$$U(a) = U_A + U_B$$

Using the bound of $U(a)$, $q \geq 2 \sin \frac{\pi}{10}$ we get the desired contradiction to Lemma 2.13

(iii) $n_1 = 2, n_2 = 7$ or $n_1 = 3, n_2 = 6$

In the sum $\sum A$ We have $2 \sin \frac{\pi}{10} \leq r_k \leq 1+a$ Hence by Lemma 3

$$\sum A \leq \frac{n_1 - v_2}{2 \sin \frac{\pi}{10}} + v_2 - 1 + \left\{ \frac{(2 \sin \frac{\pi}{10})^{n_1 - v_2}}{q} \right\}^2 = U_A \text{ say}$$

Where $v_2 = \min\{j \in \mathbb{Z}: j \geq n_1 - \frac{\log q}{\log(2 \sin \frac{\pi}{10})}\}$

In the sum $\sum B$ We have $1 \leq r_k \leq 1 + a$ Hence by Lemma3

$$\sum B \leq n_2 - v_1 + \frac{v_1 - 1}{(1 + a)^2} + \left\{ \frac{(1 + a)^{v_1 - 1}}{10 q^{-1}} \right\}^2 = U_B \text{ say}$$

where

$$v_1 = \min\{j \in \mathbb{Z}: (1 + a)^j \geq 10q^{-1}\}$$

$$U(a) = U_A + U_B$$

Using the bound of $U(a) q \geq (2\sin \frac{\pi}{10})^2$ we get the desired contradiction

(iv) $n_1 = 4, n_2 = 5$ or $n_1 = 5, n_2 = 4$

In the sum $\sum A$ We have $2\sin \frac{\pi}{10} \leq r_k \leq 1 + a$ Hence by Lemma3

$$\sum A \leq \frac{n_1 - v_2}{2\sin \frac{\pi}{10}} + v_2 - 1 + \left\{ \frac{(2\sin \frac{\pi}{10})^{n_1 - v_2}}{q} \right\}^2 = U_A \text{ say}$$

Where $v_2 = \min\{j \in \mathbb{Z}: j \geq n_1 - \frac{\log q}{\log(2\sin \frac{\pi}{10})}\}$

In the sum $\sum B$ if $q(1 + a)^{n_2} \geq 9$ We have $1 \leq r_k \leq 1 + a$ Hence by Lemma3

$$\sum B \leq n_2 - v_1 + \frac{v_1 - 1}{(1 + a)^2} + \left\{ \frac{(1 + a)^{v_1 - 1}}{10 q^{-1}} \right\}^2 = U_B \text{ say}$$

where

$$v_1 = \min\{j \in \mathbb{Z}: (1 + a)^j \geq 10q^{-1}\}$$

if $(1 + a)^2 < 9$ then $\sum B = 0 = U_B$

$$U(a) = U_A + U_B$$

Using the bound of $U(a) q \geq (2\sin \frac{\pi}{10})^2$ we get the desired contradiction to Lemma 13 and by Lemma 7 we obtain the theorem.

Abstract- In this paper, application of the graph theory to handle the function of power flow management will be introduced. Well known Ford-Fulkerson algorithm in graph theory is used to calculate the maximum flow in electricity distribution network. The maximum flow problem is one of the most fundamental problems in network flow theory and has been investigated extensively. The Ford-Fulkerson algorithm is a simple algorithm to solve the maximum flow problem and based on the idea of searching augmenting path from a started source node to a target sink node. It is one of the most widely used algorithms in optimization of flow networks and various computer applications. The implementations for the detail steps of algorithm will be illustrated by considering the maximum flow of proposed electricity distribution network in Kyaukse District, Mandalay Division, Myanmar as a case study. The goal of this paper is to find the maximum possible flow from the source node s to the target node t through a given proposed network.

Index Terms: Flow network, Ford-Fulkerson algorithm, Graph Theory, Maximum flow, Electricity distribution network.

1. INTRODUCTION

The maximum flow problem is a well-studied and widely applicable problem in algorithmic graph theory and optimization [1]. In many fields of applications, graphs theory [2] plays vital role for various modelling problems in real world such as travelling, transportation, traffic control, communications, and various computer applications and so on [3]. Graph is a mathematical representation of a network and it describes the relationship among a finite number of points connected by lines. The maximum flow problem is a type of network optimization problem in the flow graph theory [4]. Electric power distribution is the final stage in the delivery of electric power; it carries electricity from the transmission system to individual consumers. Distribution substations connect to the transmission system and lower the transmission voltage to medium voltage ranging between 2 kV and 35 kV with the use of transformers. A flow network is a directed graph where each edge has a capacity and receives a flow as weighted values [5]. In practice, the flow problems can be seen in finding the maximum flows of currents in an electrical

circuit, water in pipes, cars on roads, people in a public transportation system, goods from a producer to consumers, and traffic in a computer network, and so on.

II. RESOURCES AND METHOD

Network flow problems are central problems in operations research, computer science, and engineering and they arise in many real world applications. A simple, connected, weighted, digraph G is called a transport network if the weighted value associated with every directed edge in G is a non-negative number. This number represents the capacity of the edge and it is denoted by c_{ij} for the directed edge from node i to node j in G [6]. We consider a network of electricity distribution system and the case of network of cables having values allowing flows only in one direction. This type of network is represented by weighted connected digraph in which transformers are represented by vertices and lines which given electricity flows through by edges and capacities by weights. To provide the maximum flow from source vertex to sink vertex is one of the most important things in all transmission network. Source vertex is produced flows along the edges of the digraph G and sink vertex is received [2]. The residual graph can be defined by providing a systematic way in order to find the maximum flow. The residual capacity of an edge can be obtained by using the formula $cf_{ij} = c_{ij} - f_{ij}$ and a residual network can be defined by giving the amount of available capacity.

A. Problem Definition

The problem is given by a digraph G and an associated set of flow constraints on the edges of the graph, to find the maximum amount of flow that may travel between a source node s and a sink node t . The maximum flow problems involve finding a possible maximum flow through a single-source to single-sink flow network. The maximum flow problem can be seen as a special case of more complex network flow problems, such as the circulation problem [7]. A flow in a network is a collection of chain flows which has the property that the sum of the number of all chain flows that contain any edge is no greater than the capacity of that edge [8]. The goal is to provide as much flow as possible from s to t in the graph. The flow in any edge is never exceeded its capacity, and for any vertex except for s and t , the flow in to the vertex must equal the flow out from the

vertex. On any edge we have $0 \leq f_{ij} \leq c_{ij}$. This is called capacity constraint or edge condition.

B. Ford-Fulkerson Algorithm for Maximum Flow

In 1955, Ford, L. R. Jr. and Fulkerson, D. R. created the Ford-Fulkerson Algorithm [8]. This algorithm starts from the initial flow and recursively constructs a sequence of flow of increasing value and terminates with a maximum flow [9]. The idea behind the algorithm is simple. We send flow along one of the paths from source to sink in a graph with available capacity on all edges in the path that is called an augmenting path and then we find another path, and so on [7].

1). Steps of the Algorithm

The Ford-Fulkerson algorithm has two main steps. The first step is a labelling process that searches for a flow augmenting path and the second step is to change the flow accordingly. Otherwise, no augmenting path exists, and then we get the maximum flow [5]. The detail steps of the algorithm are stated as follows [2]:

- Step 1. Assign an initial flow f_{ij} , compute f .
- Step 2. Label s by \emptyset . Mark the other vertices “unlabelled.”

Step 3. Find a labelled vertex i that has not yet been scanned. Scan i as follows. For every unlabelled adjacent vertex j , if $c_{ij} > f_{ij}$ compute

$$\Delta_{ij} = c_{ij} - f_{ij}$$

$$\text{and } \Delta_j = \begin{cases} \Delta_{ij} & \text{if } i = 1 \\ \min(\Delta_i, \Delta_{ij}) & \text{if } i > 1 \end{cases}$$

and label j with a “forward label” (i^+, Δ_j) or if $f_{ji} > 0$, compute $\Delta_j = \min(\Delta_i, f_{ji})$ and label j by a “backward label” (i^-, Δ_j) .

If no such j exists then OUTPUT f . Stop.
Else continue (i.e., go to step 4).

- Step 4. Repeat Step 3 until t is reached.
[This gives a flow augmenting path $P: s \rightarrow t$.]
If it is impossible to reach t , then OUTPUT f . Stop.
Else continue (i.e., go to Step 5).

- Step 5. Backtrack the path P , using the labels.
- Step 6. Using P , augment the existing flow by Δ_t . Set $f = f + \Delta_t$.
- Step 7. Remove all labels from vertices $2, \dots, n$. Go to Step 3.

This is the end of the algorithm. The flowchart for the maximum flow of electricity distribution network is as follow:

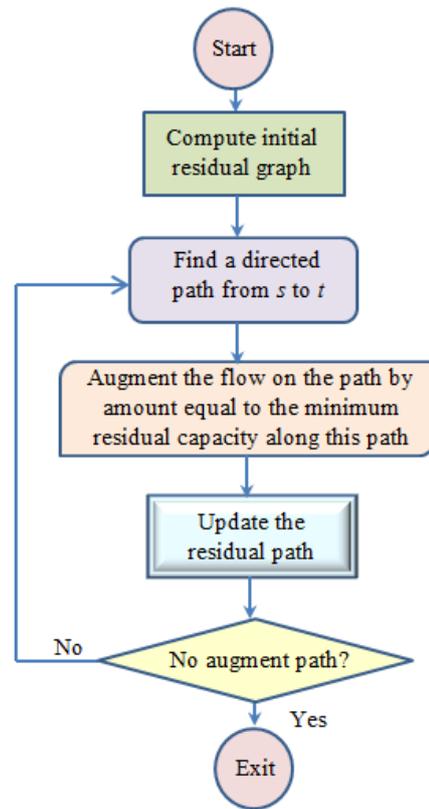

Fig. 1 Flowchart for maximum flow of electricity distribution network

III. RESULTS AND DISCUSSION

In this paper, the application of graph theory to find the maximum flow of electricity distribution network has been illustrated by using the Ford-Fulkerson algorithm [2] to the proposed electricity distribution network of Kyaukse District in Mandalay Division, Myanmar. The electrical flow will not necessarily preserve the capacity constraints that must be preserved in a maximum flow [1]. The weights on the links are referred as capacities and current flows for corresponding edges.

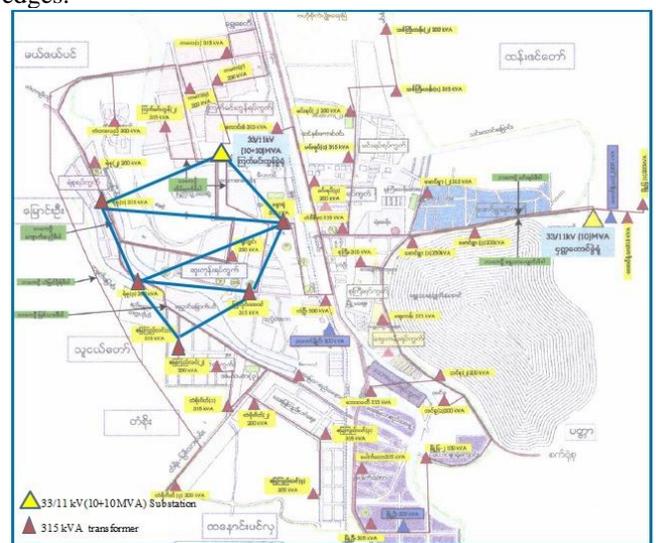

Fig. 2 Proposed network of electricity distribution network (blue) in Kyaukse District, Mandalay Division, Myanmar [10]

The flow network is a directed graph with two distinguished nodes; source and sink. Since the sizes of power cables used

in this network may not be the same, the capacity for each cable may also be different. So it can only maintain a flow of a certain amount of electricity. Anywhere those cables meet; we assumed that the total amount of electricity coming into that junction must be equal to the amount going out. Each edge between two nodes has a non-negative capacity c and receives a flow f where amount of flow on an edge cannot exceed its capacity [4]. The first number on each edge represents capacity and the second number represents current flow of electricity (kV). In this electricity distribution network, we denote the source node 1 as “ s ” and the sink (target) node 6 as “ t ” as shown in Fig. 3.

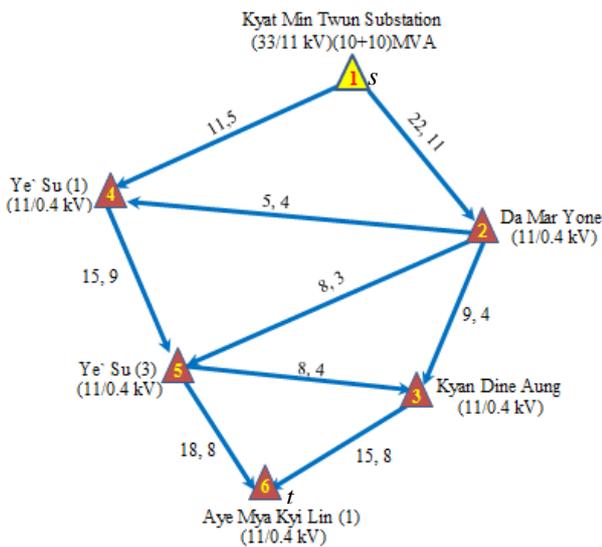

Fig. 3 Representation of digraph for proposed electricity distribution network in Kyaukse District, Mandalay Division, Myanmar

A. Implementation of the Algorithm

The implementation of the Ford-Fulkerson algorithm is illustrated to find the maximum flow for proposed electricity distribution network in Kyaukse District, Mandalay Division from source node s (Kyat Min Twun Substation) to sink node t (Aye Mya Kyi Lin (1) transformer). We can choose any path from source to sink for each iteration step as an augmenting path by using the edge with the non-zero residual capacity in previous step. This means that the edge with maximum flow cannot be used as a segment of augmenting path.

The detail implementation of algorithm can be seen as follows:

- Step 1. An initial flow $f = 11 + 5 = 16$ (Given).
- Step 2. Label ($s = 1$) by \emptyset . Mark 2, 3, 4, 5, 6 “unlabelled”
- Step 3. Scan 1
 - Compute $\Delta_{12} = 22 - 11 = 11 = \Delta_2$. Label 2 by $(1^+, 11)$.
 - Compute $\Delta_{14} = 11 - 5 = 6 = \Delta_4$. Label 4 by $(1^+, 6)$.
- Step 4. Scan 2.
 - Compute $\Delta_{23} = 9 - 4 = 5, \Delta_3 = \min(\Delta_2, \Delta_{23})$
 - $\Delta_3 = \min(11, 5) = 5$. Label 3 by $(2^+, 5)$.
- Scan 3.

Compute $\Delta_{36} = 15 - 8 = 7, \Delta_6 = \min(\Delta_3, \Delta_{36})$
 $\Delta_6 = \min(5, 7) = 5$. Label 6 by $(3^+, 5)$.

- Step 5. $P: s = 1 \rightarrow 2 \rightarrow 3 \rightarrow 6 = t$ is a flow augmenting path.
- Step 6. $\Delta_t = 5$. Augmentation gives $f_{12} = 16, f_{23} = 9, f_{36} = 13$.
 Augmented flow $f = 16 + 5 = 21$.
- Step 7. Remove labels on vertices 3, ..., 6. Go to Step 3.

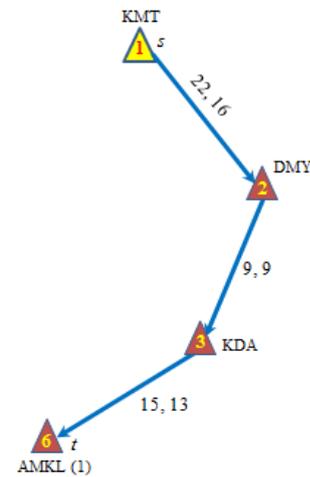

Fig. 4 Flow augmenting path 1-2-3-6

- Step 3. Scan 1
 - Compute $\Delta_{12} = 22 - 16 = 6 = \Delta_2$. Label 2 by $(1^+, 6)$
 - Compute $\Delta_{14} = 11 - 5 = 6 = \Delta_4$. Label 4 by $(1^+, 6)$
- Step 4. Scan 2.
 - Compute $\Delta_{25} = 8 - 3 = 5, \Delta_5 = \min(\Delta_2, \Delta_{25})$.
 - $\Delta_5 = \min(6, 5) = 5$. Label 5 by $(2^+, 5)$.
- Scan 5.
 - Compute $\Delta_{53} = 8 - 4 = 4, \Delta_3 = \min(\Delta_5, \Delta_{53})$
 - $\Delta_3 = \min(5, 4) = 4$. Label 3 by $(5^+, 4)$.
- Scan 3.
 - Compute $\Delta_{36} = 15 - 13 = 2, \Delta_6 = \min(\Delta_3, \Delta_{36})$.
 - $\Delta_6 = \min(4, 2) = 2$. Label 6 by $(3^+, 2)$.
- Step 5. $P: s = 1 \rightarrow 2 \rightarrow 5 \rightarrow 3 \rightarrow 6 = t$ is a flow augmenting path.
- Step 6. $\Delta_t = 2$. Augmentation gives $f_{12} = 18, f_{25} = 5, f_{53} = 6, f_{36} = 15$.
 Augmented flow $f = 21 + 2 = 23$.
- Step 7. Remove labels on vertices 2, ..., 6. Go to Step 3.

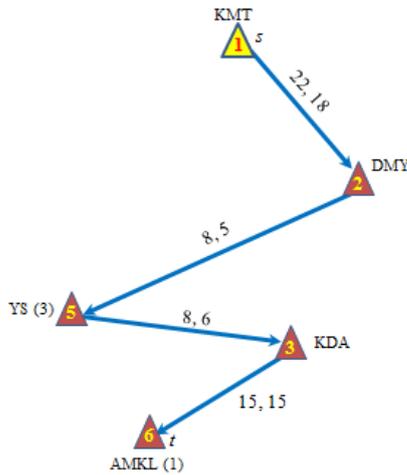

Fig. 5 Flow augmenting path 1-2-5-3-6

Step 3. Scan 1

Compute $\Delta_{12} = 22 - 18 = 4 = \Delta_2$. Label 2 by $(1^+, 4)$.

Compute $\Delta_{14} = 11 - 5 = 6 = \Delta_4$. Label 4 by $(1^+, 6)$.

Step 4. Scan 2.

Compute $\Delta_{25} = 8 - 5 = 3$, $\Delta_5 = \min(\Delta_2, \Delta_{25})$.

$\Delta_5 = \min(4, 3) = 3$. Label 5 by $(2^+, 3)$.

Scan 5.

Compute $\Delta_{56} = 18 - 8 = 10$, $\Delta_6 = \min(\Delta_5, \Delta_{56})$.

$\Delta_6 = \min(3, 10) = 3$. Label 6 by $(5^+, 3)$.

Step 5. $P: s = 1 \rightarrow 2 \rightarrow 5 \rightarrow 6 = t$ is a flow augmenting path.

Step 6. $\Delta_t = 3$. Augmentation gives $f_{12} = 21, f_{25} = 8,$

$f_{56} = 11$.

Augmented flow $f = 23 + 3 = 26$.

Step 7. Remove labels on vertices 2, ..., 6. Go to Step 3.

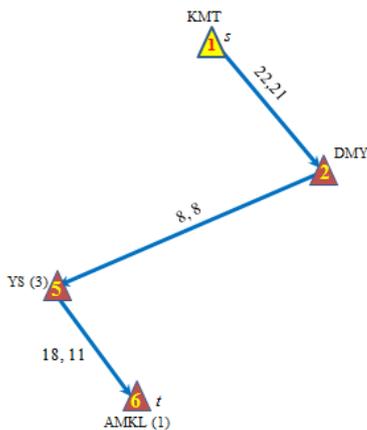

Fig. 6 Flow augmenting path 1-2-5-6

Step 3. Scan 1

Compute $\Delta_{14} = 11 - 5 = 6 = \Delta_4$. Label 4 by $(1^+, 6)$.

Step 4. Scan 4.

Compute $\Delta_{45} = 15 - 9 = 6$, $\Delta_5 = \min(\Delta_4, \Delta_{45})$.

$\Delta_5 = \min(6, 6) = 6$. Label 5 by $(4^+, 6)$.

Scan 5.

Compute $\Delta_{56} = 18 - 11 = 7$, $\Delta_6 = \min(\Delta_5, \Delta_{56})$.

$\Delta_6 = \min(6, 7) = 6$. Label 6 by $(5^+, 6)$.

Step 5. $P: s = 1 \rightarrow 4 \rightarrow 5 \rightarrow 6 = t$ is a flow augmenting path.

Step 6. $\Delta_t = 6$. Augmentation gives $f_{14} = 11, f_{45} = 8,$

$f_{56} = 17$.

Augmented flow $f = 26 + 6 = 32$.

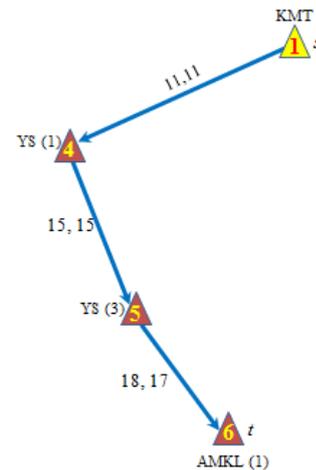

Fig. 7 Flow augmenting path 1-4-5-6

There are no augmenting paths possible from s to t , and then the flow is maximum flow. The maximum flows for all electricity in network have been calculated by iteration process of Ford-Fulkerson algorithm and can be seen in Fig. 8.

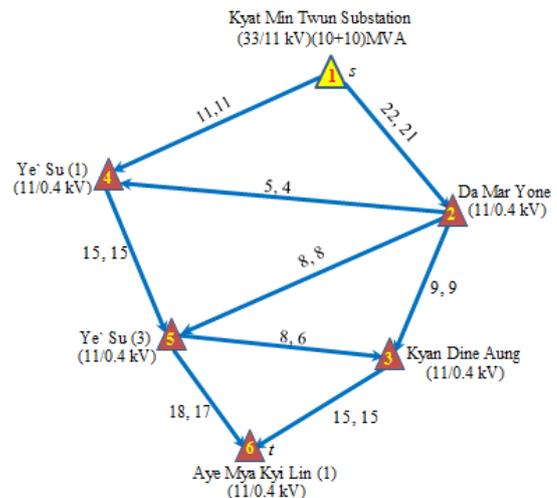

Fig. 8 Maximum flows in electricity distribution network from source node s to sink node t

The maximum flow will be the total flow out of source node which is also equal to total flow in to the sink node. In this case, total flow (maximum flow) out from source node s is $21 + 11 = 32$ and total flow in to the sink node t is

$17+15 = 32$ and hence maximum possible flow for this network is 32 kV.

IV. CONCLUSION

Nowadays, electricity is an important part of homes and industries. Almost whole the devices at homes, businesses and industries are running because of electricity. In this paper, Ford-Fulkerson algorithm has been implemented to find the maximum possible electrical flow in electricity distribution network of Kyaukse District, Mandalay Division, Myanmar. The main idea of the algorithm is to find a path through the graph from the source to the sink, in order to send a flow through this path without exceeding its capacity. Then we find another path, and so on. Maximum flow for proposed electricity distribution network has been developed to implement the algorithm by considering the capacity and flow rate of electricity in the network. The Ford-Fulkerson algorithm is guaranteed to terminate if the edge capacities are nonnegative real values. For this reason, we strongly recommend that Ford-Fulkerson algorithm is an algorithm to get the solution for finding maximum flow with simple procedure [12].

ACKNOWLEDGMENT

The author would like to acknowledge her thank to Dr. Myint Myint Khaing, Principal, University of Computer Studies, Pinlon for her permission to submit this paper in this journals. And Dr. Su Su Win, Associate Professor and Head, Faculty of Computing, University of Computer Studies, Pinlon, for her proofreading and recommendation to submit this research paper. The author would like to express her deeply gratitude to Dr. San San Maw, Professor, Department of Engineering Mathematics, Mandalay Technological University for her active encouragement, and perfect supervision throughout her research work and Dr. Lin Lin Naing, Professor and Head, Faculty of Computing, University of Computer Studies, Hinthada, Ayeyarwady Division, Myanmar, for his valuable ideas, advices and comments. Her special thanks are due to U Thein Hlaing Oo and U Win Naung Lin, Electricity Managers, Kyaukse District Electricity Manager Office under the Ministry of Electricity and Energy, for their help to collect the required data and information to her research. Finally, the author's thanks are to her beloved parents, brothers and sister because her research cannot be done successfully unless they support it.

Abstract- Increased production of lithopanaeus vannamei vannamei shrimp continues to be pursued, one of which is by increasing shrimp immune response to infection with WSSV disease. This study aims to evaluate the best dosage of dsRNA VP19 WSSV *in-vitro* production to increase the immune response of vannamei shrimp (*L. vannamei*). The isolation of the VP19 gene and the construction of the VP19 vaccines were carried out using the Megascript kit with VP 19 genomic DNA as a template. Vaccination was carried out by injection method on vannamei shrimp with an average weight of 10.5 ± 3.5 g and a length of 11.05 ± 1.95 cm. The vaccine dose tested was 0.02 μ g; 0.2 μ g; 2 μ g; and as controls are shrimp that are not vaccinated. The study consisted of four vaccine dose treatments with each of two replication and maintained for five days. The challenge test was carried out for five days by injecting the WSSV virus in saline solution (1:3 v/v). The differential hemocyte count (DHC) calculation was carried out before the challenge test and after the challenge test on days 1, 2, and 3. Data analysis was performed statistically by analysis of variance (ANOVA). VP19 gene isolation, construction with T7 promoter, and making of WSSV VP19 dsRNA were successfully carried out, and application of dsRNA vaccine in vannamei shrimp with a dose of dsRNA vaccine of 2.0 μ g had a significant effect ($P < 0.05$) on granular hemocytes cells

Index Terms- VP19 dsRNA, differential hemocyte count (DHC), vannamei shrimp, dose.

I. INTRODUCTION

Shrimp is one of the fisheries commodities which have high economic value and are widely cultivated in Indonesia, especially vannamei shrimp (*Litopenaeus vannamei*) and Black tiger *Penaeus monodon* (Tassanakajon et al., 2013). Vannamei *L.vannamei* shrimp is widely cultivated today, because it is known to have superior resistance to virus attacks and environmental changes compared to tiger shrimp. But the current reality of vannamei shrimp cultivation also often fails due to virus attacks

(Subyakto et al., 2009). One common virus that infects shrimp is white spot syndrome virus (WSSV). During the last 20 years, WSSV has been considered a viral pathogen that has the most negative impact on the shrimp culture industry. This is due to its high virulence, rapid spread, occurring in all shrimp producing countries, and mass mortality which can reach up to 100% within 3 to 7 days after the first clinical signs seem, reducing production with a large economic loss (Lucero at all, 2016)..

Prevention and treatment of viral infections is very challenging because the virus uses stem cell structures to replicate, inhibiting viral replication without damaging the structure of the host cell. Researchers have recently begun to use RNA interference (RNAi) technology to selectively inhibit viral genes that are important for virulence (Shuey et al, 2002). The RNAi technology has the role of inhibiting post-gene transcription through formation of dsRNA segments in the mRNA transcript, resulting in proper mRNA degradation. Vaccination technology uses viral dsRNA agents to develop very rapidly, especially in the fields of medical, agricultural, and aquaculture (Jin et al., 2010; Lichner et al., 2003; Rowley & Pope, 2012). In the field of aquaculture, this technology developed to overcome diseases caused by viruses in shrimp (Mejía-Ruíz et al., 2011; Ahanger et al., 2014). Some shrimp vaccination studies using WSSV agents as vaccine sources have shown progress and obtained encouraging results (Huang et al., 2014; Kumar et al., 2015; Puneeth et al., 2017).

WSSV is a double-stranded DNA (dsDNA) virus formed from complex macromolecules that are specifically attached and arranged for the protection and transfer of viral genomes. WSSV genes transcribed in the late phase include genes that encode WSSV main structural proteins, namely VP28, VP26, VP24, VP19, and VP-15. Where, this viral protein is likely to be used as a recombinant vaccine (Sánchez-Paz, 2010). VP19 is a WSSV wrap protein that is important because of its involvement in systemic infections in shrimp (Nadala et al., 1998; van Hulst, 2001b; Zhang et al., 2002). The latest results of the study were reported by Nurhaeda (2017), who succeeded in making VP19 dsRNA vaccine which was able to increase the survival, immune response and histology of vannamei shrimp.

Isolation and characterization of the WSSV VP19 virulent gene has been successfully carried out (Nurhaeda, 2017), but as a dsRNA vaccine in increasing survival, immune response and histology of shrimp with various doses after challenge tests WSSV is still lacking, so this study needs developed with using various doses as an effort to control WSSV infection in vannamei shrimp. This study aims to evaluate the best dosage of WSSV VP19 DNARNA *in-vitro* production to increase the immune response of vannamei shrimp (*L. vannamei*).

II. MATERIALS AND METHODS

2.1 Research Materials

The shrimp genome material that was use was the vannamei that was positively infected with the WSSV virus. The genomic DNA collection from the Laboratory of Brackish Biotechnology Research Center for Brackish Water Aquaculture and Maros Fisheries Extension (BRPBAP3) in Maros.

2.2 Research Methods

Stages carried out in the research to produce VP19 dsRNA are: Isolation of VP19 gene, Construction of VP19 WSSV gene with *in-vitro* RNAi method, and production of WSSV VP19 dsRNA, then application to test animals to see Differential Haemocyte Count (DHC) after challenge test.

a. Isolation of WSSV VP19 Encoding Genes

Isolation of the VP19 gene carried out using the PCR technique. The DNA genome that has been isolated from vannamei shrimp used as a template for DNA (template) in the PCR process, using the forward primer VP19 F 5'-CGC GGA TCC GAT CAC CAC GAC TAA CAC-3 and reverse VP19 R 5'-CCG primer GAA TTC TTA CTG CCT CCT CTT GGG-3 with a target of 366 bp (Sarathi *et al.*, 2010).

Amplification performed on the System 2700 PCR GeneAmp PCR engine (Applied Biosystem). The PCR reaction used is the PureTaq Ready-To-Go PCR Beads-GE Healthcare kit (2.5 units of PuReTaq DNA polymerase; 200 μ M each dNTP; 10 mM Tris-HCl pH 9 at room temperature; 50 mM KCl; 1.5 mM MgCl₂) and primer 1 μ L each, 0.5 μ L vannamei shrimp DNA genome, and nuclease free water 22.3 μ L with a last volume of 25 μ L.

Then sample the spin down for \pm 10-15 seconds. Samples entered into PCR machines with PCR amplification reactions as follows: pre-denaturation 94°C for 5 minutes in 1 cycle; 35 cycles for denaturation of 94°C for 30 seconds, annealing 53°C for 30 seconds, extension 72°C for 30 seconds; and the last 72°C extension for 7 minutes then added 4°C at the end of the cycle.

Next to see the success of amplification of target DNA fragments, 1 μ L sample was electrophoresis on 1% agarose gel with 20 mL TAE 1 buffer solvent, then 1 μ L gelred added documented with Gel Documentation System. The molecular weight of the DNA fragment determined using a 100 bp plus marker.

b. WSSV VP19 Gen Construction with T7 Promoter

Construction of WSSV VP19 gene with T7 promoter carried out by PCR technique. The VP19 WSSV gene is used as a template using the T7 VP19 primer: 5'-TAA TAC

GAC TCA CTA GAC GGA GCG GAT CCG ATG GCC ACC CTA ACC-3 CTA 'and T7 VP19R primer: 5'-TAA TAC GAC TCA CTA TAG GGA CGG AAT TCT TAC TGC CTC CTC TTG GGG-3'(bottom line is T7 primary sequence).

Amplification performed on the System 2700 PCR GeneAmp PCR engine (Applied Biosystem). The PCR reaction used was the PureTaq Ready-To-Go PCR Beads-GE Healthcare kit by adding primers of 2.5 μ L, 0.5 μ L of the mold genome, and nuclease-free water 19.5 μ L with a final volume of 25 μ L.

Samples were inserted into the PCR machine with PCR conditions as follows: 94°C for 5 minutes, followed by 25 cycles of 94°C for 30 seconds, annealing temperature of 72°C for 30 seconds and extension 72°C for 30 seconds, followed by last extension of 72°C for 7 minutes.

Next to see the success of amplification of target DNA fragments, 1 μ l sample was electrophoresed on 1% agarose gel with 20 ml TAE 1 buffer solvent, then added 1 μ l of gel documented with Gel Documentation System. The molecular weight of the DNA fragment determined using a 100 bp plus marker.

Nexted PCR with the premier T7 VP19, on the PC 27 GeneAmp PCR (Applied Biosystem) PCR engine. The PCR reaction used was the PureTaq Ready-To-Go PCR Beads-GE Healthcare kit by adding primers of 2.5 μ L each, 0.5 μ L of the mold genome and nuclease-free water 19.5 μ L with a final volume of 25 ML.

Samples were inserted into the PCR machine with PCR conditions as follows: 94°C for 5 minutes, followed by 25 cycles of 94°C for 30 seconds, annealing temperature of 72°C for 30 seconds and extension 72°C for 30 seconds, followed by last extension of 72°C for 7 minutes.

Next to see the success of amplification of target DNA fragments, 1 μ l sample was electrophoresis on 1% agarose gel with 20 ml TAE 1 buffer solvent, then added 1 μ l of gel documented with Gel Documentation System. The molecular weight of the DNA fragment determined using a 100 bp plus marker.

c. Manufactures WSSV dsRNA-VP19

The PCR results used for the synthesis of dsRNA using the MEGAscript RNAi (Ambion) kit. The sample used to produce dsRNA is a sample that was successfully constructed with the T7 promoter.

The concentration of PCR products measured to find the number of PCR products to be used in making the RNase transcript reaction. Subsequently added to the new tube: Adenine triphosphate (ATP), Cystidine triphosphate (CTP), Guanosine triphosphate (GTP), Uridine triphosphate (UTP) (2 μ L); 10x T7 Buffer (2 μ L); T7 enzyme mix (2 μ L); PCR products (1.5 μ L); Nuclease-free water 6.5 μ L; Total tube 1 (20 μ L) Appendix 1.

Then in the spin down at medium speed and incubated at the incubator at 37°C for 6 hours (every 30 minutes the sample shaken). For the Annealing process, it was re-incubated at 75°C for 5 minutes then cooled to room temperature for about 3 hours then the dsRNA stored at -20°C and -80°C until it reused.

Then the process of Digestion DNA and ssRNA uses MEGAscript RNAi kit (Ambion) with the following composition: dsRNA VP19 (tube 1) 20 μ L; Nuclease-free water (21 μ L); Digestion buffer (5 μ L); DNase I (2 μ L); RNase A (2 μ L) Total tube 1 (50 μ L).

After all the ingredients mixed then spindown and incubated at 37°C for 1 hour (not more than 2 hours). Then leave it at room temperature for 5 minutes. The next process is purification which aims to remove proteins, free nucleotides, and nucleic acid degradation products from dsRNA, namely dsRNA (tube 1) (50 µL); 10x binding buffer 50 µL; Nucleace-free water (150 µL); 100x ethanol (250µL); Total tube 1 (500 µL).

These ingredients added to tube 1 and spin down, after which th added to the fliter cartidg. Then centrifuge at a speed of 14,000 rpm at 4°C for 2 minutes. The supernatant is remove, add 500 µL wash solution and centrifuge at a speed of 14,000 rpm at 4°C for 2 minutes. The supernatant is discard, add 500 MI wash solution and centrifuge with a speed of 14,000 rpm at 4°C for 2 minutes. The supernatant removed and repeat the dry centrifuge, homogenized it with 50 µL elution solution (95°C), centrifuge at a speed of 14,000 rpm at 4°C for 2 minutes. homogenized again with 50 µL elution solution (95°C), centrifuge at 14,000 rpm at 4°C for 2 minutes. Homogenate is remove and the supernatant is remove. Furthermore, measuring WSSV VP 19 dsRNA concentration and to see the success of the target RNA in electrophoresis by using agarose 1% with TAE 1x buffer solvents as much as 20 mL and added as much as 1 µL and documented with Gel Documentation System (Appendix 2). The molecular weight of the DNA fragment determined using a 100 bp plus marker.

d. Application of WSSV dsRNA-VP19 to Vannamei Shrimp

Experiments conducted to test whether dsRNA VP19 with different doses can improve the survival and immune response of vannamei shrimp against WSSV virus infection and to see the level of hepatopancreas tissue damage in test animals. The limits to observed are DHC.

The study will be designed using a Completely Randomized Design (CRD) with 4 treatments and each treatment each has 3 replications. Thus this study consisted of 12 experimental units. The vaccine dose tested refers to the study of Loy et al. (2012) namely: a. Shrimp injected with saline solution (SS) without vaccine (control), 0.02 µg, 0.2 µg and 2.0 µg

1. experiment animals

The vannamei shrimp used came from Barru Regency ponds with an average weight of 10.5 ± 3.5 g and an average length of 11.05 ± 1.95 cm. The shrimp have been vaccinated maintained in a fiber-controlled tub measuring 80 cm x 80 cm x 60 cm which equipped with aeration, with density of 10 fish / tub, using sea water media and fed with commercial feed 2% of body weight and

given 2 times a day before the challenge test and 4 times a day after the challenge test.

2. dsRNA vaccine

On the first day, the shrimp in each treatment injected with VP19 dsRNA with the dose tested in the second segment of the abdominal section using a syringe volume of 1 mL and 0.1 mL in each test shrimp. The test animals were then maintained until the third day, then tested challenged with the WSSV virus.

3. Test challenges using the WSSV virus

The challenge test was to infect the WSSV virus through the injection method into vannamei shrimp. WSSV isolates came from the Maros BRPBAP3 Fish and Environmental Health Laboratory which been tested molecular. On the 3rd day after vaccination, challenge tests carried out by injecting 0.1 mL WSSV virus in each test shrimp. Before the challenge tes carried out, first take a hemolim sample from each treatment randomly (4 individuals per treatment group) to observe the immune response. During the study, observation carried out.

4. Differential Haemocyte Count (DHC)

Differential hemocytes are then calculated by grouping hemocytes into 3 cell types (granular, semi granular, and hyaline), the percentage of each cell type calculated using the formula:

$$DHC (\%) = \frac{\text{number of each type of hemocyte cell}}{\text{hemocyte count}} \times 100\%$$

2.3 Data Analysis

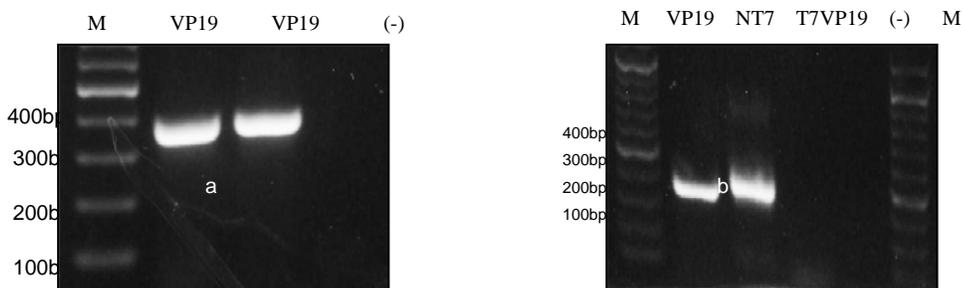

The parameters of the DHC immune response were analyzed using the ANOVA test at the level of 0.05.

III. RESULTS AND DISCUSSION

1. Characteristics of the WSSV VP19 gene

a. Isolation of WSSV VP19 encoding gene

The VP19 encoding gene was successfully isolated from WSSV on the vannamei shrimp genome DNA which was positively infected with white spot disease using the PCR technique using VP19F and VP19R specific primer. Electrophoresis results showed that one DNA fragment at position of around 366 bp (Figure 1a) and VP19 gene construction was also successfully carried out on the nexted promoter T7 (T7 VP19). Can be seen in (Figure 1b) which shows an increase in DNA fragments from VP19 position between 400-500bp.

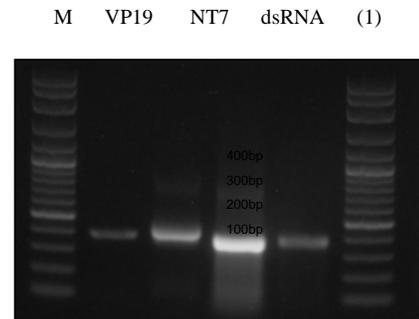

Gambar 1. Electrophoresis results of PCS VP19 WSSV (a) and nexted PCR T7 VP19 WSSV (b) isolated from the vannamei shrimp genome that were positively infected by WSSV. M = marker 100+, VP19 = gene VP19, NT7 = nexted T7 PCR, T7VP19 = promoter T7 VP19, (-) = negative control.

The results of PCR amplification and authentication with VP19 WSSV encoding gene electrophoresis, DNA fragment bands at position of around 366 bp which showed that the VP19 encoding gene was successfully isolated from the vannamei shrimp genome that was positively infected with the WSSV virus. This has also been successfully carried out in isolating other VP19 and VP-WSSV encoding genes in both vannamei shrimp and tiger shrimp. The results of the study carried out by Alim *et al.* (2011), reported that isolation of the WSSV VP19 gene encoding in tiger shrimp Situbondo isolates was 366 bp; Tenriulo *et al.* (2015), showed that the VP24 WSSV encoding gene was successfully isolated from tiger shrimp with a sequence length of about 641-648 bp; Parenrengi *et al.* (2017), reported that VP15 was successfully isolated from tiger shrimp with ORF DNA fragment length (open reading frame) of 243 bp; Hidayani *et al.* (2016), showed the success of isolating the coding gene for WSSV VP19 protein in vannamei juvenile of Indonesian isolates with a DNA fragment length of 387 bp; Hidayani *et al.* (2013), reported that gene encoding of the VP19 WSSV protein in tiger shrimp had a size of 386 bp; Malina *et al.* (2013), reported that isolation of VP28 surface protein encoding genes from tiger shrimp was successfully carried out with a fragment length of 672 bp. The results of the VP-WSSV encoding genes isolated from the shrimp genome infected with WSSV showed that the primary pair was specifically able to amplify the VP-WSSV gene from the shrimp genome infected with WSSV. Furthermore, it said that differences in genome size show chance of mutations caused either by deletion or presence of certain sizes of insertion in the WSSV genome (Yang *et al.*, 2001).

b. Production of WSSV dsRNA-VP19 *in-vitro*

Production of WSSV VP19 dsRNA was successfully carried out *in-vitro* using the MEGAscript RNAi kit with purity of 1.96 and a concentration 850 µg / mL, where a purity level above 1.8 was indicated as a product for production of dsRNA. Linacero *et al.* (1998), recommend the ratio value for pure double-stranded DNA between 1.8–2.0. The same method carried out for production of *in-vitro* gonad inhibiting hormone (GIH) dsRNA using the MEGAscript RNAi kit (Wulandari, 2010). The success of *in-vitro* dsRNA production using the MEGAscript kit is characteristic by high levels of purity, and an increase in fragments or parallel to the control fragments, and the WSSV

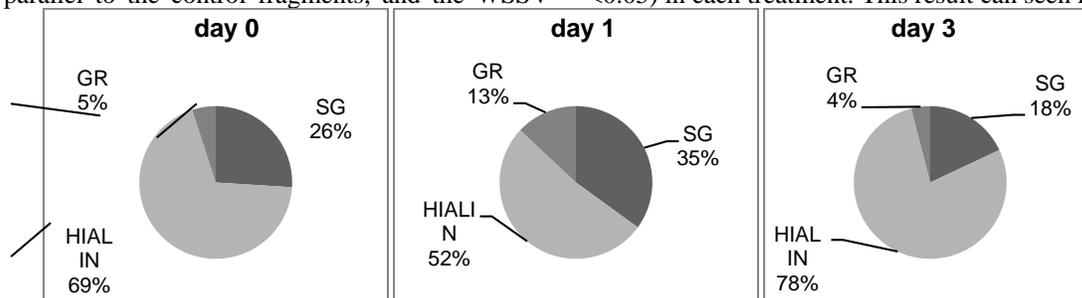

VP19 dsRNA fragment band seen as verified by 1% agarose electrophoresis. This result can be seen in (Figure 2) there is a VP19 DNA fragment that constructed with the T7 promoter.

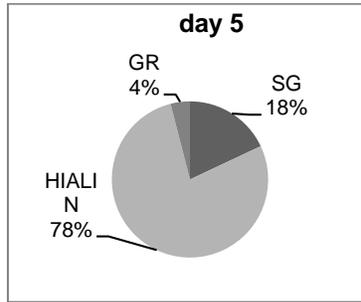

Gambar 2. Electrophoresis produced by WSSV dsRNA-VP19. M = marker100 +, VP19 = VP19 gene, NT7 = nexted promoter T7, dsRNA = WSSV dsRNA-VP19 production.

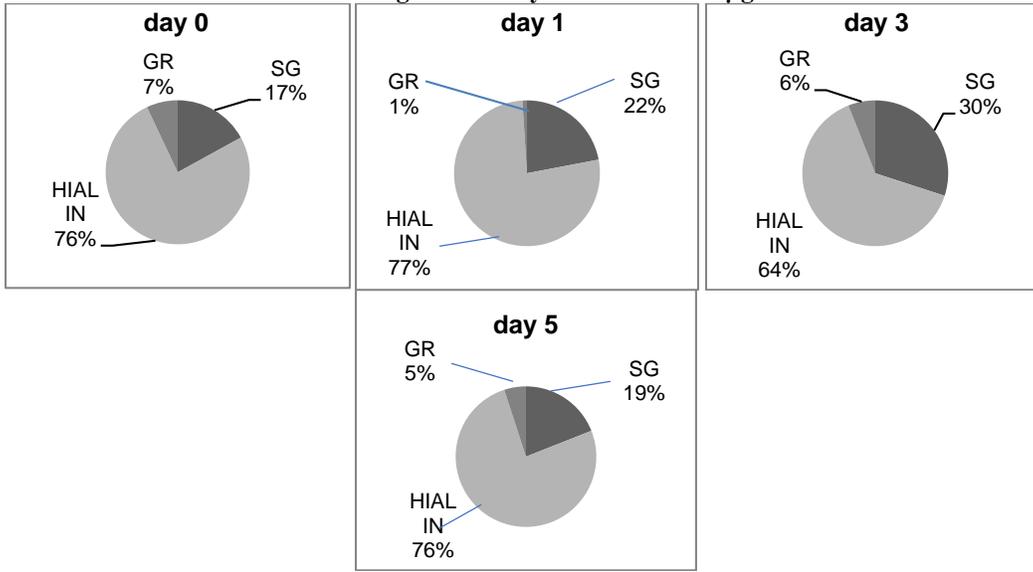

2. Differential Haemocyte Count (DHC)

Based on the results of the study before and after the challenge test with the WSSV virus at each dose showed an average DHC value, the number of hyaline hemocytes cells dose 0 µg, 0.02 µg, 0.2 µg, and 2 µg before the challenge test which is 69%, 76 %, 74% and 72%. After that, semi granular 26%, 17%, 20%, and 22%. Furthermore, granular is 5%, 7%, 7% and 6%. The results after the challenge test were obtained for the average DHC values of hyaline, semi granular, and granular hemocytes with doses of 0 µg, 0.02 µg, 0.2 µg, and 2 µg on days 1, 3 and 5th is hyaline (52%, 77%, 64%, and 68%), (78%, 64%, 64%, and 68%), (69%, 76%, 69%, and 69%), Variety analysis showed no significant difference (P> 0.05) in each treatment. Semigranular (35%, 21%, 27% and 25%), (18%, 30%, 24%, and 20%), (7%, 19%, 20%, and 17%), variance analysis showed no significant influence (P> 0.05) on each treatment. Granular (13%, 1%, 9%, and 7%), (4%, 6%, 13% and 12%), (4%, 5%, 11% and 14%) the results of the tukey advanced test show differences that real (P <0.05) in each treatment. This result can be seen in Figure 3.

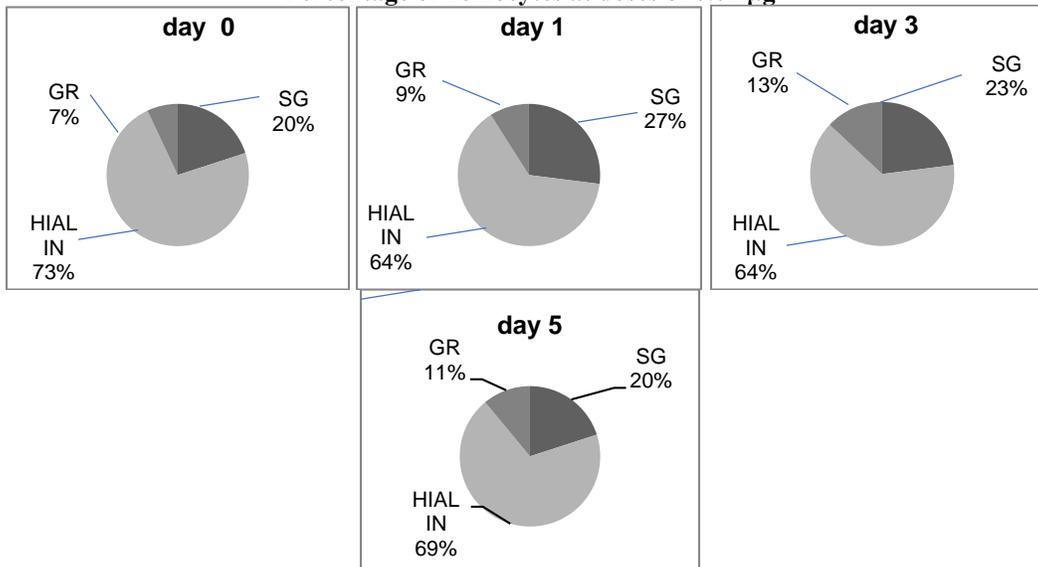

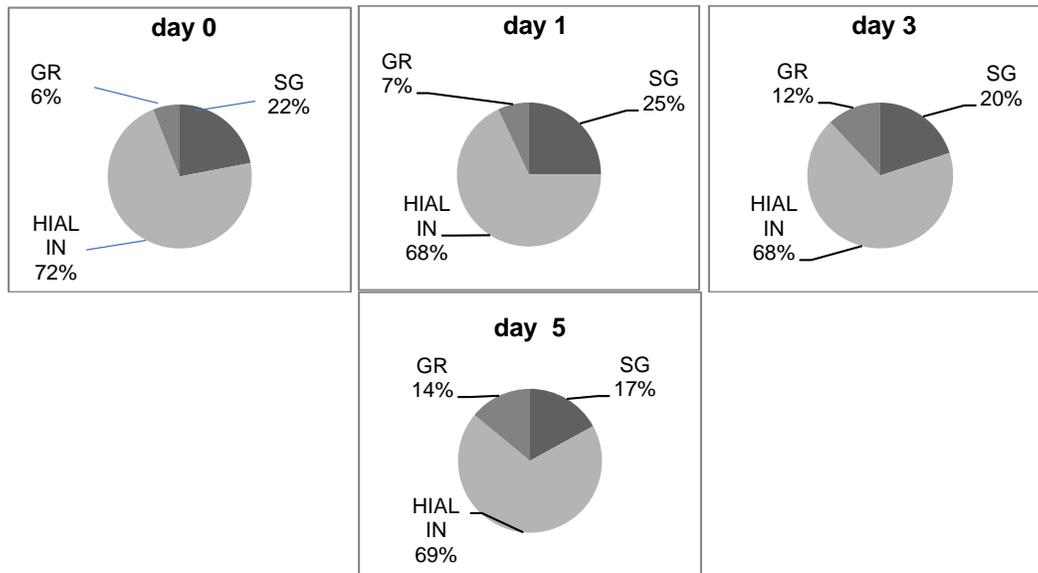

Percentage of hemocytes at doses of 0 µg

Percentage of hemocytes at doses of 0.02 µg

Percentage of hemocytes at doses of 0.2 µg

Percentage of hemocytes at doses of 2,0 µg

Gambar 3. Percentage of differential haemocyte count (DHC) of vannamei *P. vannamei* shrimp before and after testing challenged with WSSV virus. ANOVA analysis showed no significant difference ($P > 0.05$) hemocytes cells in each treatment.

The results of the study of hemocyte cell differentiation consisting of hyaline, semigranular, and granular cells of vannamei shrimp before and after the challenge test showed differences in the effect that varied in (Figure 3). Hyaline cell results showed no significant difference ($P > 0.05$) in each treatment. Vannamei shrimp hyaline cells were vaccinated and then injected with WSSV decreased on day 1 and day 3, while on day 5 there was an increase compared to controls. Hyaline cells depicted by the absence granular function as cells that do phagocytosis (Smith et al. 2003). Increasing hyaline cells can increase phagocytes activity against pathogens that enter the crustacean body (Le Moullac et al. 1998; Smith et al. 2003).

Semigranular cells described as having small granules, which function in recognizing and responding to pathogens that enter the crustacean body (Soderhall and Cerenius 1992). While granular cells described as cells that have a large number of granules which function in storing and releasing the proPO system and as toxicity together with semigranular cells (Smith et al, 2003). Although there was a decrease in the percentage of semigranular in this study, granular cells showed a significant effect ($P < 0.05$) which was able to increase phenoloxidase activity which plays a role in the melanization process. Each active cell type in the immune reaction, such as hyaline cells involved in phagocytosis, semigranular cells are active in encapsulation, and granular cells are active in the storage and release of proPO and cytotoxic systems.

IV. CONCLUSION

The results showed that VP19 gene isolation, construction with T7 promoter, and making of WSSV VP19 dsRNA were successfully carried out, and the application of dsRNA vaccine in vannamei shrimp with a dose of dsRNA vaccine of 2.0 µg had a significant effect on granular hemocytes

V. SUGGESTION

Further research needs to developed on vaccine production in-vivo and evaluates on the day that vaccines increase and survive.

Abstract- This research aims to describes the influence of the Pictorial Riddle method of inquiry learning model on critical thinking skills in the material of social conflict in class XI IIS MAN Karimun. The experimental research design method True experiment, with Pretest-Posttest Control Group Design design cluster random sampling technique is divided into two classes, namely class XI IIS1 as the experimental class that received learning treatment using the inquiry pictorial type riddle learning model, and class XI IIS2 as a class control who received treatment using PBL learning model (Problem Based Learning). The research data was obtained through essay tests to measure students' critical thinking skills. Data analysis using analysis techniques Independent Test Samples T-test and N-Gain Test. The results of the calculation of data analysis obtained an average value of the experimental class 79.32 and the average value of the control class 71.76 with a significant level of $\alpha = 0.05$ having a significance value of $\alpha < 0.05$, namely Sig (2 - tailed) 0.0007 < 0.05 . Based on the calculation results there is a significant effect of inquiry learning model on the pictorial riddle method on critical thinking skills of students of class XI IIS MAN Karimun

Keyword: *Inquiry Learning Model, Pictorial Riddle, Critical Thinking Skills*

I. INTRODUCTION

Education is a factor that determines the quality of life of a nation. The quality of life of the nation is produced through the implementation of quality education. The government has made efforts, among others, by developing a curriculum starting from the Competency Based Curriculum (CBC), Education Unit Level Curriculum (KTSP) to the current 2013 Curriculum. In the 2013 curriculum emphasizing emancipatory-transformative education is an educational model that seeks to develop all the abilities of students towards a more free and creative process of thinking. Transformative learning (transformative learning) which is a model of learning is more oriented towards the transformation (change or repair) perspective or the perspective of the learners so that they can become a person who is more wise in acting, mature in thinking, wise in making decisions, regardless of whether the process traversed more relies on rational-cognitive aspects as well as active psychiatric dimensions (Hardika, 2013 p. 12).

So far the learning process in the classroom is still focused on the teacher (teacher centered) as the main source of education. This pattern of bank style education (banking system education) as mentioned by Paolo Freire (2000) only transfers knowledge from teacher to student, the role of the teacher is too dominant to turn off the role and actualization of students. Learning bank style is learning figurative, not operative. Such a situation certainly does not involve students in developing problems so that it can reduce or even kill students' mindsets, creativity, and activeness.

Critical thinking is important to deal with changes that are so rapid and rapid (Slavin, 2017, p.137). The goal is to make rational decisions about what he can believe to be true (Suprijono, 2013, p. 42-43). With critical thinking skills can help students reprocess information obtained in the learning process to be able to combine, apply, analyze and can help students solve problems (Solange Muglia Wechsler et al., 2018).

Djunadi (2014), states that sociology lessons are boring because the approach applied by the teacher in classroom learning is less attractive where most students only memorize concepts and are less able to connect what they have learned with applications in society, so the class is still focused on the teacher as the main source of knowledge, then lecture as the main choice in determining the Sholahudin learning method (2008).

To anticipate these problems, the right learning method so that it can improve students' critical thinking skills, namely through the inquiry approach. Inquiry is a way of learning that is intended to develop problem solving skills using the critical mindset of Hamalik

(2001). The inquiry model is based on observations and scientific studies so that it is suitable for use in social studies learning especially Sociology subjects where students are directly involved with the object being studied, by giving problems or providing very effective assignments to trigger student involvement (Gwo-Jen Hwanget al., 2015)

The material sociology subjects suitable for-assisted inquiry learning models Pictorial Riddle are material social conflicts. The material of social conflict chosen in this study is because in human life it will not be separated from conflict. (Wirawan, 2010, p. 5) Conflict is one of the essence of human life and development which has diverse characteristics. Humans have different sexes, social and economic strata, legal systems, nations, ethnicities, religions, beliefs, political streams, and cultures and goals in their lives. In the history of mankind, this difference always causes conflict. As long as there are still differences, conflicts cannot be avoided and will always occur. A problem, both individual and group, must be handled quickly so that problems such as conflicts can be resolved, even though conflicts can arise again at some time. Based on the description above, the researcher is interested in conducting research on the influence of the inquiry learning model riddle pictorial on students' critical thinking skills in social conflict material.

II. RESEARCH METHODS

This study was conducted at MAN KARIMUN in class XI IIS semester 2 of the 2018/2019 academic year. The population in this study were 43 students of IIS MAN KARIMUN class XI. The sample was selected by cluster random Sampling. The sample was divided into one control class and one experimental class. The experimental class was treated using a-based inquiry learning model pictorial riddle, while in the control class was given a learning treatment of Problem Base Learning. The experimental design for this study was True Experiment Design Pretest-posttest Group Design control. Data collection techniques in this study used test questions to determine students' critical thinking skills. The research implementation instruments were syllabus, Learning Implementation Plan (RPP) and Student Worksheet (LKS). Instruments for retrieving data using essay test questions that are used to measure students' critical thinking skills. The normality test of the data used is non parametric Kolmogorov-Smirnov and the homogeneity test used is the Test of Homogeneity of Variance. Hypothesis testing in this study uses Independent Samples T-test and N-Gain test with the help of SPSS 23 for window.

III. RESULTS AND DISCUSSION

Description of Data

Description of data for the two classes that received treatment with the method pictorial riddle and the base learning problem in critical thinking skills can be seen in table 2.

Table 2
Description of Data PostTest Critical Thinking Ability Students

Descriptive Statistics Results	Experimental	Class Control Class
N Valid	22	21
Missing	0	0
Mean	79.32	71.76
Median	43.00	43.00
Std Deviation	9,021	7,758
Variance	81,370	60,190
Minimum	67	63
Maximum	92	83

Source: Primary Data Processed

Table 2 shows that the average critical thinking ability in the class using the method pictorial riddle better than the class that gets treatment with the method problem base learning. After testing hypotheses using the independent test sample t-test and N-Gain test results of the analysis can be seen in table 3.

Table 3
Test Results Independent Sample t-test Final Value of Research Student Critical Thinking Ability Test (Post-test)

		t-test for Equality of Means			
Mean	T	D	Sig.	Mean	
		f	(2-tailed)	Difference	
Contro l	Experi mental)		
71.76	79.32	-	4	.007	
				-	

2,845	1	7,223
-------	---	-------

Source: Primary Data Processed

The calculation results of SPSS 23 for the window in the table are known that the value of t_{count} is -2.854 and t_{table} with significance level (5%) 0.05, degree of freedom (db) = (n-2) then obtained $t(0.05)$ (41) table = -2,019. Then the results of the value of $t_{count} > t_{table}$, which shows the results of -2,854 > -2,019. The significance level of 5% (0.05) has a significance value of $\alpha < 0.05$, which is sig (2-tailed) 0.007 < 0.05. So it can be concluded that there is a significant difference in critical thinking skills between the experimental class and the control class after being given treatment, meaning the results of the experimental class critical thinking ability after being treated with the inquiry learning model Riddle pictorial are better than the control class using the PBL learning model (problem based learning). This is reinforced by the experimental class having an average value of 79.32 and the control class has an average value of 71.76.

Based on the results of the N-gain score calculation, it shows that the N-gain score for the experimental class (inquiry learning model riddle pictorial) is 65.145 or 65.14% including the quite effective category. With a minimum N-gain score of 38.89% and a maximum of 88.06%. While the average N-gain score for the control class (PBL model) is 53.146 or 53.14% included in the less effective category with a minimum N-gain score of 31.48 and a maximum of 74.63.

Thus it can be concluded that the use of the learning model Riddle pictorial has a better influence and effectiveness than the use of the PBL model on students towards critical thinking skills in material social conflict.

Discussion on the Effect of Pictorial Inquiry Learning Riddle Model on Critical Thinking of Students Based on the above results, it shows that the two research classes, both experimental and control classes, have a pre-test value that is not too far away. The value obtained during the pre-test is caused by students not yet fully knowledgeable about the material to be studied. Students are able to work on several questions but the answer is not right. Whereas it was different at the time of the post-test when the students had obtained the material given by the teacher, both classes had an increase in the average value of the post-test. The difference is the number of increases in the average post-test value is different between the experimental class and the control class, where the experimental class has a higher average value than the control class.

The results of this study found that the t-test test aimed to find out the difference between students' critical thinking skills before applying the inquiry learning model riddle pictorial in the experimental class and PBL learning model (Problem Base Learning) in the control class obtained $t_{value} < t_{table}$, namely -0.568 < -2.019 and the significant value of $\alpha > 0.05$, ie (2-tailed) 0.573 > 0.05, then H_0 is received and H_1 rejected. So there was no difference between the experimental class and the control class before being given treatment. That is, the two experimental classes were no better than the control class in critical thinking skills students from both classes had the same ability in critical thinking skills.

Whereas after being given treatment, where the experimental class was given inquiry model learning riddle pictorial and the control class was given PBL learning model (Problem Base Learning) obtained a value $>$ that is the result of -2,845 > -2,019. while the significance level of 5% (0.05) has a value of < 0.05 , namely sig (2-tailed) of 0.007 < 0.05, then there is a significant difference in critical thinking skills between the experimental class and the control class after being given treatment. This means that the results of the experimental class critical thinking ability after being treated with the inquiry learning model Riddle pictorial are better than the control class that uses the PBL learning model (Problem Base Learning).

These results are also in accordance with previous studies, as conducted by Kristianingsih (2010), Nurseptia (2013) Jane Arantika (2014) shows that learning with the inquiry learning model is Riddle pictorial able to improve students' critical thinking skills, so students are easier to solve problems existing by providing various alternative answers, so that student learning outcomes become maximum.

The difference in the results of the critical thinking ability test scores between the experimental class students and the control class is most likely due to inquiry learning riddle pictorial used to improve thinking skills, communication and encourage students to express opinions in discussion groups. In the classroom with the inquiry learning model the method pictorial riddle, the teacher divides students into heterogeneous groups. Group division is done randomly by considering the level of ability of students. So that in one group will consist of weak students who are accustomed to repeating lessons and students who often get the value of a pictorial riddle where students use the inquiry model Riddle pictorial and control class using PBL models (Problem Base Learning) is possible because each treatment has characteristic in its application. In the experimental class was taught using assisted inquiry learning model pictorial riddle that has 6 phases. The orientation phase in the experimental class, the teacher gives a small demonstration in the form of giving pictures related to the material given. Based on the demonstration given, students are given the opportunity to ask questions or give their responses.

According to Wina Sanjaya (2011), the orientation phase where the teacher conditions so that students are ready to accept the lesson, the teacher stimulates and invites students to start using their abilities to solve problems through an apperception. The purpose of apperception is so that students can relate their initial knowledge to the new knowledge they will receive, this is reflected by the teacher giving small questions to be solved by students based on demonstrations or phenomena displayed by the teacher. Students are expected to provide answers with clear and logical reasons. These questions orient students at the beginning of learning so students have a real picture of the problem. In the control class, the apperception given is almost the same. The aim is to condition students. The treatment given by the teacher during the orientation phase is a way to develop students' thinking skills.

The phase of formulating the problem conditions students to be directed at a problem that must be solved. Phase formulating a problem focuses students on recognizing a given problem. Formulating problems helps students to form critical thoughts that need to live smart and lifelong learning. The problems presented are problems that challenge students to think about solving related problems. Students are encouraged to find the right answer. The process of finding this answer becomes very important in inquiry because students will gain valuable experience as an effort to develop mentally through the process of thinking. The problems that are displayed in the form of riddles tucked into LKS are problems that must be resolved in thinking. Different treatments were given to the control class because the problem presented was not in the form of a riddle. This results in the majority of students not having an interest or not having the belief that the problems learned are difficult to solve.

Phase formulates prediction of answers, students first seek as much relevant information as possible through the literature. This information search will make it easier for students to provide predictions of temporary answers to the problems given. Making predictions of answers, guessing or guessing an answer to a problem is the beginning of a thought process. This is in line with Wina Sanjaya (2011) who said that when an individual or student can provide predictions and then prove his predictions, he will arrive at a position that can encourage further thinking. Learning in the control class, there is no hypothesis formulation made by students. Students are only given problems to be solved directly without going through the stages of inquiry. The phase of collecting data is a phase that contains the activities of students capturing information needed to test the predictions of the answers submitted. According to Permendiknas Number 81a of 2013, the activity of collecting information is done through experiments, reading sources or literature other than textbooks, and so on. Questions that are guiding students are given to direct students to the concept of the problem referred to in the LKS. Data collection provides opportunities for students to think. Independent activities are intended so that students can find ideas, facts, concepts, want to understand themselves in groups. Based on the questions given, students are asked to complete the data obtained through reading references, then connecting with the knowledge they have, as well as connecting with problems at Riddle.

Stage of discussing the prediction of answers, students are asked to present the results of their group discussions alternately. Students are given the freedom to express predictions of answers that are equipped with data from problems that must be resolved. Other students provide responses or questions related to the presenter's presentation. Students can develop their ability to ask questions, answer a number of questions and provide logical reasons, which are part of a series of critical thinking activities. The stage of discussing predictive answers, students can develop their ability to think rationally. According to Wina Sanjaya (2011) at this stage of inquiry students can develop rational thinking skills, which means that the truth of the answers given is not only based on argumentation, but must be supported by data collected in the previous stages of the arguments proposed can be accounted for. The final stage is formulating conclusions, students process and analyze the results of the discussions they get. Students are asked to conclude based on the results of hypothesis testing. The aim is to get accurate conclusions based on the results of discussing predictions of answers. In the control class, the formulation of conclusions emphasizes the formulation of important conclusions or points according to the material they are explained by the teacher. So that students find more conclusions on the process of remembering the information delivered, not processing it.

Murwani, 2006 learning in the experimental class, students are also equipped with riddle which makes it easier for students to understand problems and worksheets that contain questions guiding students to find answers. In the inquiry process the teacher provides assistance to students through guiding questions, so that students in groups learn by guided questions in the LKS and their implementation is assisted by Riddle followed by discussion. In line with scaffolding Vygotsky's "" theory which states that the stages in student learning start from the assistance provided in stages, where at the beginning of learning students get a lot of help later in the next lesson the amount of aid is getting smaller until finally students are able take charge of themselves independently. As for the assistance meant by Vygotsky, students have two levels of development, namely the actual level of development and the level of potential development. Where the level of actual development is the determination of individual intellectual functions and the ability to learn certain things themselves. While the level of potential development is a level that is functioned with the help of others, both from teachers, parents, and peers (Arend, 2008: p. 47). This has led to interactions between students and others in cultural concepts, which later became known in Vygotsky's theory as Zone of proximal Development (ZPD).

In discussion activities, students are faced with several arguments. Students are indirectly trained to think how they defend their opinions and encourage students to think and work on their own initiative, students will understand concepts and ideas better, help use memory and transfer to new learning situations. Riddle given is an explanatory image of the problem given. Riddle in the form of images can stimulate students' thinking power, especially after students observe riddle and answer guiding questions, students are invited to discuss the problems presented. Learning directly from the problem given will make it easier for students to understand the concept and provide broad opportunities for students to explore themselves through the learning activities undertaken (Kristianingsih, 2010).

According to Zaman, et al. (2015) students can think critically if they have a good understanding of a concept. A good understanding is obtained because students have a thinking framework that supports problem solving and critical thinking (Cutrer, et al., 2011). To foster understanding of concepts in the cognitive structure of students, a meaningful learning process is needed. In the view of constructivism, to build a new knowledge, students will adapt new information or experiences they have through interacting with people and the surrounding environment. Through the inquiry learning model, pictorial students are more enthusiastic and enthusiastic in carrying out the investigation process to collect data in the form of facts and process these facts so that students are able to build

conclusions independently. Vygotsky believes that encouraging cognitive development is social interaction / children's experience with others.

According to Vygotsky, the experience of students will accelerate cognitive development or critical thinking skills. A person's learning outcomes are obtained through direct experience (concrete), reality that exists in one's life environment then through artificial objects, to the verbal symbol (abstract). In the cone of experience, Edgar Dale's the cone peak was getting more and more abstract the message media. The process of learning and teaching interaction does not have to be from direct experience, but begins with the type of experience that best fits the needs and abilities of the group of students faced by considering the learning situation. Direct experience will provide information and ideas contained in that experience, because it involves the senses of sight, hearing, feeling, smell, and touch. In this study the level of student involvement is visually leading to involvement. Visual is paying attention to the picture, involved is the process of discussion with his friend / teacher. By being involved, the child's learning experience is increasingly imprinting, so lessons are easy to remember.

IV. CONCLUSION

Based on the results of hypothesis testing, students who use the inquiry learning model Riddle pictorial are better than PBL learning models (Problem Based Learning). This is because the inquiry learning model Riddle pictorial is encouraging students to think and work on their own initiative, students will understand concepts and ideas better, help use memory and transfer to new learning situations. Riddle given is an explanatory image of the problem given. Riddle in the form of images can stimulate students' thinking power, especially after students observe riddle and answer guiding questions, students are invited to discuss the problems presented. So that students more easily understand the steps in formulating problems to find solutions to problems in a way together with peers communicate with each other to give information to one another with students. This then has implications for the results of students' critical thinking skills.

Abstract- The study aims to investigate the improvement of analytical thinking skills through the 4A (analysis phenomenon, analysis information, analysis data, and analysis finding) learning models on science education. Research methods use the quasi-experiment, with one group pre-test and post-test design with a class VII sample on the subject matter of climate change. Through the gain-score test, the results of the 4A learning model that has the syntax of phenomenon analysis, information analysis, data analysis, and analysis of findings were able to improve the analytical thinking skills moderate level average of secondary school students in natural science subjects.

Keywords- 4A learning models, analytical thinking skills, secondary school, natural science subject

I. INTRODUCTION

The analysis is used to identify intense and actual relationships as long as the statements, questions, concepts, descriptions or forms of representation are expressed to express a belief, justification, experience, reaction, information, and opinion [1]. Analysis and evaluation are recognized skills required by each student in various fields of science, such as analyzing computer programs, laboratory test results, infographics, and so on [2]. Natural Sciences is one of the disciplines that study the symptoms of nature and its interactions. The essence of natural science consists of scientific attitudes, scientific processes, and scientific

products. This scientific process is known as the scientific method. According to [3], a simple experimental method consists of three (3) operations, i.e., observing, explaining, and testing from the described event based on Lampiran Permendikbud No. 68 Tahun 2013 [4]. The objectives of science learning revitalize the natural science process skills for students, teachers, and prospective teachers as the main mission of learning science teaching in school to develop observation skills, plan investigations, interpret (interpretation) data and information (narrative, drawings, charts, tables) and conclude. To be able to conclude then needed analysis thinking skills.

Amer et al. [5] expressed thought analysis is a powerful thinking tool to understand the parts of the situation, defined as 1) the ability to examine and parse the facts and thoughts into strengths and weaknesses and 2) Develop the capacity to think wisely, intelligently, resolve problems, analyze data, remember and use information.

Students' analytical thinking skills are still low. It is based on The Global index of cognitive skills and educational achievement of The Learning Curve Pearson of The Year 2014 [6], Indonesia is ranked at 40 from 40 countries, where students are still at a low level of thought, namely knowledge and Understanding. This also emphasized with preliminary studies conducted by researchers at Secondary school in Sidoarjo that the skills of

analytical thinking students are categorized low because of the ability of students still stage of memorizing, understanding, and applying yet at stage analyzing [7]. Normally, every problem has a constraint, uncertainties, and various solutions, and there are no formal techniques that can produce the best solution [8].

Thinking analysis is a relationship with the scientific process; thinking synthesis is expressed in planning, building, and developing the essence of the design process [9]. Thinking analysis is also a part of high-level complex thinking with the application of important learning for students [10]. According to [2], analysis and evaluation are recognized as crucial skills that all students must master. On learning activities need to guide teachers about: 1) basic knowledge of thinking analysis; 2) analysis thinking process, and 3) Manage classes to develop analysis thinking [11]. Based on the study, a model of learning is needed to practice analytical thinking skills. Another way is to teach by following the objectives of the curriculum. Teachers can apply teaching methods emphasizing on thinking development to improve their students' ability. It is not only in content but the thinking skills as well [12].

Actual learning models, among others, help students acquire skills, ideas, information, grades, ways of thinking, and self-expressing and also teach how to acquire them. The 4A learning model is a valid model of content and a construct to practice the analytical thinking skills of junior high school students in science subjects. The 4A learning Model has four syntaxes: phenomenon analysis, information analysis, data analysis, and findings analysis.

Fourth learning model syntax 4A theoretically and empirically trained analysis thinking skills. The syntax of analysis phenomenon aims to distinguish contrasting phenomena to formulate problems. The syntax of information analysis aims to organize relevant and irrelevant information so that students

can formulate hypotheses. The data analysis syntax aims to obtain findings from experiments/ experiments to distinguish and organize the data that is further analyzed. The syntax of the findings aims to attribute or to make conclusions from the results of previous findings. Thus the indicators of the analysis thinking include distinguishing, organizing, and catalyzing the training in each syntax.

In preparing the students for creative thinking skills and analysis required a balance between inter and transdisciplinary as well as a habit of mind patterns to cultivate the skills of the 21st century [13]. Also, empirical learning of science improves student confidence and motivation; Help learns about yourself; Develop problem-solving, psychomotor, and mental skills; give meaningful lessons; Improve analytical thinking skills; and support the relationship between natural science and everyday life [14]. Thus it is very appropriate if the analytical thinking skills begin to be trained for students.

II. IDENTIFY, RESEARCH AND COLLECT IDEA

Research design using one group pre-tests and Post-test group for, with class VII trial class in secondary school. The technique of data collection using test techniques, i.e., giving test thinking analysis skills before and after given treatment by applying learning model 4A. The data analysis technique uses the gain score from the pre-tests and post-test values. The value of this increase was used as a reference model of the 4A learning can improve the analytical skills of secondary school students in natural science subjects.

III. RESULTS OF FINDINGS

Data on analytical thinking skills that contain analysis indicators: distinguish, classify, and attribute can be seen in the following Table 1:

Table 1. Percentage of Improved Analytical Thinking Skills

N-gain	Level	Percentage (%)
0.91	High	9.68
0.61	Moderate	90.32

Based on Table 1, it is acquired that improved analytical thinking skills at a moderate level average in 90.32%. This is evidenced by the performance of a 4A learning model syntax that includes analysis phenomenon, analysis information, analysis data, and analysis finding was a good category.

The assessment of the students' answers when the tests were carried out is the data describing the level of students' analytical thinking skills [15]. Students' analytical thinking skills are measured using analytical thinking skills tests that contain analytical indicators, including distinguishing, classifying, and attributes. Test result analytical skills students with strong analytical skills have a pattern and detail, able to identify the elements of the situation and determine the parts that have relations [16]. By observing the results of increased tests gained that the criteria for improvement are moderate and high, it means that students have a pattern and detail.

According to Mulyasa [17], good planning will help teachers in the process of teaching and learning activities. The achievement of learning objectives is also influenced by how to lesson plan strategies are designed that is certainly by the characteristics of students to be taught. Teachers in teaching natural science subjects in addition to the characteristics of students also need to pay attention to the characteristics of teaching materials.

The process of analytical thinking skills is the development of activities directly through the process of thinking [18]. Analyzing means breaking material into constituent parts and determining the relationship between the parts and the relationship between those parts with the overall structure or purpose [10]. Anderson and Krathwol [19] expressed analysis involving separation of material into its core parts and determining how those parts relate to each other or overall. This category of

processes includes cognitive processes that distinguish, organize, and attribute. Analytical thinking is blended with critical thinking, especially as a part of the problem-solving process, considered essential for providing the skills required to prepare children for more complex life and work environment in 21st century [20].

Robbins expressed thought analysis was a chain of uniform behavior but involved an element of investigation and further situation with the results and parameters that were poorly structured [21]. Thinking analysis is needed when the ambiguous situation that students need in identifying or creating problems to be resolved. Courses in Computational Thinking have demonstrated success in many schools; however, this research demonstrates its effectiveness in improving analytical skills in majors as well as non-majors [22].

A basic skill requires the foundation for analysis thinking that is not only done by data [23]. Literacy is a way to develop logic, analysis, and scientific Thinking [24]. Thinking analysis is the competency of identifying and classifying is a different aspect where objects, stories, or events are a small part that fused and found the relationship of components, cause consequences, to understand Relation [11]. Thus the analysis is done for some things, not just for data analysis. Based on learning theory, a dynamic process results from interactions with both individuals and the environment, intelligence as a creation from prior knowledge and understandings, and cognitive growth as autonomous which includes both social settings and the physical environment of the learning [25].

IV. CONCLUSIONS

Based on data analysis results, it was acquired that a significant learning model 4A was able to improve the analytical thinking skills of secondary school students in natural science subjects.

Factors Affecting Incident Reporting – A Qualitative Study

K.B.Samarakoon*, S.Sridharan**

* Postgraduate Institute of Medicine, University of Colombo

** Ministry of Health, Nutrition & Indigenous Medicine, Sri Lanka

DOI: 10.29322/IJSRP.9.08.2019.p9233

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9233>

Abstract- Incident reporting is an integral part of patient safety. Therefore, studying enablers and barriers to incident reporting is important to improve quality of patient care. Nursing Officers, who are front line health care providers, play an important role in incident reporting in hospital setup. The objective of this study was to describe enablers and barriers for incident reporting by Nursing Officers in Medical, Surgical, Paediatric, Gynaecology and Obstetrics wards in the Teaching Hospital, Kandy. This was a qualitative study, and the study instrument was key informant interview. Key informants were selected within the Teaching Hospital, Kandy using maximum variation sampling technique. Qualitative analysis of the key informant interviews was done with thematic analysis. Lengthy process of incident reporting, presence of culture of blame, insufficient knowledge on incident reporting, presence of heavy work load and lack of feedback for the reported incidents acted as barriers for incident reporting while training on incident reporting acted as an enabler. Simplification of the process, formalizing the feedback mechanism, changing the blame culture and continuation of training programmes can be recommended to improve incident reporting in these selected wards in the Teaching Hospital, Kandy.

I. INTRODUCTION

The Institute of Medicine stated “To err is human”, highlighting the possibility of making errors by healthcare providers (Kohn et al., 1999). Harvard Medical Practice Study reveals that the death toll due to medical errors each year in the United States is equivalent of a jumbo jet crashing each and every day (Watcher, 2012). Similarly, World Health Organization states that every tenth patient in Europe faces a preventable adverse event (World Health Organization, 2014). However, with the socio economic development of the society, the patients’ expectations for healthcare is increasing. In order to maintain the quality of a service, the gap between customers’ expectations and their perceptions on the service that they receive has to be reduced (Parasuraman, Zeithaml and Berry, 1985). As medical errors have significant impact on

patients’ perceived service, errors have to be reduced in order to improve service quality in healthcare settings.

For the purpose of reducing errors, it is important for healthcare providers to learn from errors occurring in healthcare settings. The ancient Greek philosopher Aristotle had mentioned ‘Quality is not an act, it is a habit’, and this quote emphasizes the importance of the learned behavior in this context (Kaizen Institute - India, 2013). However, adverse events are not only due to personnel factors such as carelessness and incompetency of health care providers; underlying problems prevailing in those settings also contribute greatly to such incidents (Morath and Turnbull, 2005). An expert group in the national health system of the United Kingdom has also recommended learning from failures (Department of Health - London, 2000).

In order to learn from errors and failures, data on patient safety incidents should be available. Patient safety related data can be used in identifying health hazards, determining where to allocate resources, and in deciding interventions for the purpose of improving patient safety (Pronovost et al., 2008).

The way of gathering patient safety related data is incident reporting. Many researchers consider incident reporting system as an effective tool for learning from incidents (Pfeiffer, Mansor and Wehner, 2009; Vincent, 2007). Moreover, incident reporting highlights the areas where improvements are needed (Elder et al., 2007). The Institute of Medicine also, in their four tiered strategic approach, has recommended incident reporting for learning from errors (Kohn et al., 1999). The World Alliance for Patient Safety, in their forward programme published in 2005, has taken the theme “Reporting and Learning” as their sixth action area (World Health Organization, 2004).

Literature has shown that there are weaknesses in incident reporting all around the world. (Cullen, et al., 1995; Elder et al. 2007; Pfeiffer et al. 2009)

II. METHODOLOGY

This was a hospital based analytical cross sectional study and was carried out in selected ward in the Teaching Hospital, Kandy. Key informant interviews were done to collect data and therefore this was a qualitative study.

The main objective of this was to describe enablers and barriers to incident reporting by Nursing Officers in Medical, Surgical, Paediatric, Gynaecology and Obstetrics wards in the Teaching Hospital, Kandy.

Maximum variation sampling, which is a type of purposive sampling, was taken for the selection of key informants for key informant interviews. The Director, Deputy Directors, Medical Officer in charge of the QMU, Nursing Officer in charge of the QMU, and Ward Sisters in Medical, Surgical, Paediatric, Gynaecology and Obstetrics wards were taken to the study population. The reason for selecting maximum variation sampling was to assess the phenomenon related to research questions broadly as seen by different people (Cohen and Crabtree, 2006).

The unit of analysis of this study was a Nursing Officer attached to a basic specialty ward i.e. Medical, Surgical, Paediatric, Gynaecology and Obstetrics wards, of the Teaching Hospital, Kandy.

The study was conducted from September 2016 to August 2017. The data was collected from 15th of April, 2017 to 15th of May, 2017.

Ethical clearance was obtained from the Ethics Review Committee of the Post Graduate Institute of Medicine, which is an affiliated institute of the University of Colombo. Approval for data collection was taken from the Director of the Teaching Hospital, Kandy.

Data was analyzed with thematic analysis technique as described by Braun and Clarke, (2006).

III. RESULTS

Findings of the key informant interviews were thematized as shown in the Table 1.

Table 1: Thematic Analysis – Factors Affecting

Incident Reporting

Theme
Process
Culture of blame
Knowledge
Workload
Feedback

Figure 4.2 shows the pattern diagram developed after thematic analysis.

Figure 1: Thematic Analysis – Patterns

IV. DISCUSSION

Process in relation to incident reporting was one the most prominent findings of the key informant interviews, and it was mentioned as one of the most important barriers for incident reporting.

Many key informants mentioned that books were available at section matrons’ offices for documentation of the incidents happening in wards. Once an incident happened in a certain ward, a nursing officer was supposed to write the complaint book and go to the relevant section matron’s office at a convenient time and he or she had to document the incident in that book according to a given format. That was an established practice in this setting. In addition to that process, the formal incident reporting form introduced by the Ministry of Health was brought to the ward from the Quality Management Unit and filled. Thus, it can be noted that there were two processes. i.e. the well-established traditional incident reporting form by the Ministry of Health according to the circular 01-38/2016 (Ministry of Health, 2016). Some Ward Sisters, in their interviews, stated that there were two processes for reporting an incident. They felt that documentation in a book and filling the newly introduced incident reporting form as a duplication of work. As one key informant stated “There are too many steps in the incident reporting process.” Ward Sisters act as leaders for the nursing staff, their views on the currently practicing process might have transmitted to the Nursing Officers. That might have given the nursing staff the feeling of additional burden in reporting an incident. According to the study done by Elder et al. (2007), lack of time was a barrier for reporting. Therefore, presence of two processes would have further hindered their incident reporting behaviour in this setting.

At the same time, one of the key informants revealed “Training programmes affected as enablers to incident reporting”. Therefore, extension of training programmes to build leadership skills in middle level and operational level managers would be beneficial in an attempt of improving incident reporting.

According to the analyzed data of the key informant interviews, feedback was one of the factors acting as a barrier for incident reporting in this study (Figure 1). It was reported

that the Nursing Officers were not well aware of the actions taken for the incidents reported by them, and as a consequence they might tend to believe that it was useless to report. These findings tally with the results of the qualitative study done by Kingston et al (2004) and with study done in six South Australian hospitals by Evans et al (2006).

Streamlining the process of incident reporting, Creating a supportive environment for incident reporting, Formalizing the incident reporting forms, Continuation of training on incident reporting, Formalizing the feedback mechanism, Appraising for reporting incidents, Application of digital Technology to report incidents can be recommended to improve incident reporting.

V. CONCLUSION

Lengthy process of incident reporting, presence of culture of blame, insufficient knowledge on incident reporting, presence of heavy work load and lack of feedback for the reported incidents acted as barriers for incident reporting while training on incident reporting acted as an enabler for the Nursing Officers employed in Medical, Surgical, Paediatric, Gynaecology and Obstetrics wards in the Teaching Hospital, Kandy.

ACKNOWLEDGEMENTS

The Director and the Deputy Directors of the Teaching Hospital, Kandy are acknowledged.

LIMITATIONS

This study was conducted in Medical, Surgical, Paediatric, Gynaecology and Obstetrics wards in the Teaching Hospital, Kandy. Many factors can vary between region to region and hospital to hospital. Thus the results may not be generalized to all of the hospitals in Sri Lanka.

Validity of Science Student's Book to Practice Critical Thinking Skills

Roihana Waliyyul Mursyidah, Muslimin Ibrahim, Mustaji

Elementary Education Study Program, Universitas Negeri Surabaya

DOI: 10.29322/IJSRP.9.08.2019.p9234

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9234>

Abstract- This research aims to describe validity of students' book for practicing students' critical thinking skills. The research used descriptive quantitative method. Instruments data collection used validation questionnaires. Data analytical techniques used quantitative descriptive data analysis. Research result shows that the validity of students' book and related instruments are declared very valid. Based on the discussion of the results and findings, it was concluded that students' book that have been developed in natural science subject are suitable to be used to practice students' critical thinking skills.

Index Terms- science, students' book, critical thinking skills

I. INTRODUCTION

Critical thinking skills are skills that are very much needed in the 21st century. This critical thinking skill is a challenge in the education system in Indonesia [1]. The importance of having critical thinking skills is also a major aspect of education in Indonesia which is reflected in the Graduates' Competency Standards (SKL) of elementary school students (SD) [2].

But the facts that occur in the field are the implementation of learning does not encourage the emergence of children's critical and creative thinking skills [3]. One of the things that causes the lack of critical thinking skills of children is because when the learning process in the teacher class does not provide opportunities for students to express opinions that are in the minds of students [4].

Based on the results of interviews conducted to elementary school teachers, in terms of learning, subject teachers still explain the material using the lecture method [5]. In the learning process, the teacher has not been able to create conditions and situations that allow students to build critical thinking processes [6]. This can be seen from the activities of teachers and students during teaching and learning activities. The teacher explains the material that has been prepared and provides routine and continuous practice questions. Students only record, copy, and tend to memorize without meaning and understanding.

Furthermore, in terms of the quality of textbooks used by students, the textbooks used do not include indicators of critical thinking [7]. Textbooks are learning manuals that students use to help achieve national education goals [8]. In helping to achieve national education goals, textbooks that are a guide for students must be appropriate. In this case the textbook can function as an intermediary in achieving national education goals. But in fact, the textbooks that hold students in check are not enough to help students achieve national education goals.

To be able to train critical thinking skills, facilitation is needed which can be used as a tool in applying it, one of which can be through textbooks. Validation of textbooks that can train critical thinking skills is needed to provide confidence that the textbooks compiled have relevance of content in the 2013 Curriculum. Therefore, this study was conducted to answer the question of how the validity of science teaching books to train critical thinking skills of elementary school students? The purpose of this study is to describe science teaching books to train critical thinking skills of elementary school students.

II. IDENTIFY, RESEARCH AND COLLECT IDEA

This research is a quantitative descriptive study to describe the validity of Natural Science teaching books based on metacognitive strategies to train critical thinking skills of fifth grade elementary school students. The validity of the teaching book is a very valid, valid, quite valid, and invalid statement made by the validator based on the feasibility mode of the assessment points on the aspects of textbooks. The research subjects were students of Al-Hikmah Elementary School V Surabaya in the even semester of the academic year 2018/2019. Data collection techniques for validating textbooks to train students' critical thinking skills are carried out through validation questionnaires. Validation sheet from experts by giving textbooks that have been designed to two experts (validators) to be assessed and given input in the form of suggestions and criticism. The results of the validation questionnaire and suggestions from the validator are documented. The validator gives an assessment by checking (√) in the appropriate value column. The column contains the assessment scores that have been

determined, on each validation sheet there are four categories, namely: (a) not good (value 1), (b) quite good (value 2), (c) good (value 3), and (d) very good (value 4).

Analysis of data from the teaching book validation was obtained through the values on the expert validation questionnaire sheet. This analysis is done by averaging the scores of each component given by the validators. Data analysis techniques model validation includes textbook validation instruments to train students' critical thinking skills. The data obtained were analyzed by the average score of each aspect. The results of the validation conducted by the validator indicate that the validated textbooks are valid to train students' critical thinking skills.

III. RESULT AND DISCUSSION

This textbook is validated by two validators who are experts in the fields of basic education and learning technology. Validation of textbooks includes the components of content feasibility, components of feasibility of presentation, components of language feasibility, and components of the feasibility of graphics.

A. Component of Feasibility to Fill

The details of the results of the validation of the science textbook developed in the component eligibility content by the two validators are presented in table 1.

Table 1. Results of Content Feasibility Validation

No.	Assessment Aspect	Score			K
		V ₁	V ₂	M	
1.	Completeness of material	4	4	4	Very Valid
2.	Material depth	3	4	3.5	Valid
3.	Accuracy of facts, concepts and principles	4	4	4	Very Valid
4.	Accuracy and suitability of examples/illustrations and questions	3	4	3.5	Valid
5.	Free of SARA, pornography and bias	3	4	3.5	Valid
Validity category mode					Valid

Keterangan:

V1 = Validator 1

V2 = Validator 2

M = Mean value of two validators

K = Category

The results of the validation component of the content obtained from the two validators can be used with a slight revision. Suggestions obtained from the two validators are presented in Table 2.

Table 2. Suggestions for revision of textbooks based on the component of content igibility

Validator	Suggestions	Revision
Validator 1	Water cycle testing steps need to be reviewed. Use easy-to-use ingredients	The material used in the water cycle experiment step is replaced using easily available materials

Based on the data presented in the table 2 . , in terms of the components of content feasibility , the IPA teaching book received an assessment from both validators with the validity of the textbook category category.

B. Component of Content Feasibility

The results of the validation component of the presentation feasibility obtained from both validators can be used (without revision). However, there is one input from the validator 2 to revise the deficiencies in the science teaching book that will be presented in the third paragraph

Table 3. Suggestions for revision of textbooks based on the component of presentation feasibility

Validator	Saran	Perbaikan
Validator 2	1) The space on page 31 needs to be reviewed	1) Spaces are corrected according to the suggestions submitted

The details of the results of the validation of science teaching books developed in the component of the feasibility of presentation by the two validators are presented in T- 4.

Table 4. Results of Validation of Feasibility of Presentation

No.	Aspek Penilaian	Skor			K
		V ₁	V ₂	M	
1.	Systematic consistency in the chapter	4	4	4	Very Valid
2.	Logic / presentation	4	4	4	Very Valid
3.	<i>Advance organizer</i> (learning motivation generator)	3	4	3.5	Valid
4.	There are practice questions at the end of the chapter	3	4	3.5	Valid
5.	There are references / reference sources for text, image tables, and attachments	3	4	3.5	Valid
6.	The accuracy of numbering and naming tables, images, and attachments	3	4	3.5	Valid
7.	Presentation orientation is student-centered	4	4	4	Very Valid
8.	preliminary	4	4	4	Very Valid
9.	Table of contents	4	4	4	Very Valid
10	Glossary	4	4	4	Very Valid
11	Bibliography	4	4	4	Very Valid
Category Validity mode					Very Valid

Keterangan:

V1 = Validator 1

V2 = Validator 2

M = Mean value of two validators

K = Category

Based on the data that has been presented in table 4. , in terms of the components of the feasibility of presenting textbooks, the textbooks for science received an assessment from both validators with the validity of the textbook category category.

C. Component of Language Feasibility

The results of the language feasibility validation obtained from the two validators can be used with a slight revision. Suggestions obtained from the two validators are presented in table 5.

Table 5.
Suggestions for revision of textbooks based on the component of language feasibility

Validator	Suggestion	Repair
Validator 1	There are a number of words that are still incorrectly written	Some incorrectly written words are corrected according to PUEBI

The details of the results of the validation of the IPA teaching books are the components of linguistic feasibility by the two validators presented in table 6 .

Table 6. Validity of Language Feasibility Results

No.	Assessment Aspect	Score			K
		V ₁	V ₂	M	
1.	Conformity with the level of development of students' thinking	4	4	4	Very Valid
2.	Understanding of students about the message	3	4	3.5	Valid
3.	The ability to motivate students	3	4	3.5	Valid
4.	The accuracy of grammar and sentence structure as well as the consistency and consistency of the use of symbols / symbols / terms	4	4	4	Very Valid
5.	Linkage and integrity of meaning	3	4	3.5	Valid
Validity category mode					Valid

Keterangan:

V1 = Validator 1

V2 = Validator 2

M= Mean value of two validators

K = Category

Based on the data presented in Table 6 . In terms of the linguistic feasibility component of the textbook, the IPA teaching book received an evaluation from the two validators with the validity of the textbook category category .

D. Kegrafikaan Feasibility Components

The results of the validation of the grammatical feasibility component obtained from the two validators can be used with a slight revision. Suggestions were obtained from both validators presented in Table 7.

Table 7. S aran revision of textbooks based components eligibility kegrafikaan

Validator	Suggestion	Repair
Validator 1	The font type on the cover must be consistent	The font on the cover is consistent

The details of the validation results of the feasibility IPA textbook kegrafikaan by both validators are presented in Table 8.

Table 8. Results of Kegrafikaan Feasibility Validation

No.	Assessment Aspect	Score			K
		V ₁	V ₂	R	
1.	Book size conformity with ISO standards	3	4	3.5	Valid
2.	Suitability with the contents of the book	3	4	3.5	Valid
3.	The appearance of elements of the layout on the front, back, and back cover has unity	3	4	3.5	Valid

No.	Assessment Aspect	Score			K
		V ₁	V ₂	R	
4.	The appearance of elements of the layout on the front, back, and back covers gives the impression of a good and harmonious rhythm	3	4	3.5	Valid
5.	A good center of view on titles and illustrations	3	4	3.5	Valid
6.	The composition of the layout elements (titles, authors, illustrations, logos, etc.) is balanced and has a pattern that matches the layout of the contents of the book	3	4	3.5	Valid
7.	Size comparison of proportional layout elements	3	4	3.5	Valid
8.	Have a good contrast	3	4	3.5	Valid
Validity category mode					Valid

Keterangan:

V1 = Validator 1

V2 = Validator 2

R = Rata-rata nilai dua validator

K = Kategori

Based on the data presented in Table 8, in terms of the components of the feasibility of the academic textbooks, the science teaching books received an assessment from the two validators with the validity of the textbook category category

A. Recapitulation of Results of Science Textbook Validation

Based on the results of the textbook validation in each component of feasibility, the following is the recapitulation of the category of validity mode in each component of the validity of the textbook.

Table 9. Recapitulation of Modes of Validity Category for each Textbook Component

No.	Component of Feasibility	Component Feasibility Category Mode
1.	Content Feasibility	Valid
2.	Feasibility of Presentation	Very Valid
3.	Feasibility of Language	Valid
4.	Feasibility of Kefrafikaan	Valid
Mode for the Feasibility of Textbook		Valid

Based on the data presented in Table 9 . , from the validation of each component of the textbook feasibility, the science teaching book received an evaluation from both validators with valid textbook category validity mode so it can be concluded that science teaching books are based on valid metacognitive strategies to train critical thinking skills of elementary school students

VI. CONCLUSION

The validity of textbooks fulfills very valid criteria, namely in terms of the component of feasibility of contents with an average score of 4, the component of feasibility of presentation with an average score of 4, the component of language feasibility with an average score of 4, and the feasibility component of the average score of 4.

ACKNOWLEDGMEN

T

We are especially grateful to Universitas Negeri Surabaya lecturer, validator, and all those who directly and indirectly helped us in this research

Abstract- Obviously, due to scarcity of skilled workforce organizations are establishing and consistently modifying HR Plan to stand out in order to attract and retain the best talented workforce necessary for efficiency, enhanced organizational productivity and profitability. Scrummy Food, Inc. is a young company that has the desire to increase its market share and beating competitive edge through a systematic market system enhanced by talented and skilled workforce but lacks the capacity of well-established human resource department with goal oriented HR manager. The human resource plan (HRP) is the paramount responsibilities of the human resource department headed by the HR manager who is responsible for the establishment and execution of the HR Plan which is a scheme that enables companies to plan ahead in order to maintain a steady supply of skilled workforce, evaluate organizational needs and as well plan ahead to meet those obligations. HR planning plays a significant role in an organization because since employees are the most internal valuable assets of the company, they should be available when needed, placed in appropriate positions, given trainings, benefits, compensations and be rewarded adequately.

Index Terms- management, human resources, planning, diversity, recruitment, selection, training, compensation, benefits, retention, bonus

I. INTRODUCTION

Organizations embark on human resource planning (HRP) to enable them move from the current skilled workforce position to the desired skill workforce position, and is a process that begins with the company's estimation for employee requirements and thereafter sources are found from where this need can be fulfilled (Kenton, 2019). HR Plan is mostly vested in the hands of the human resources manager who is responsible for the arrangement of the appropriate people for the right job from all the variable sources (Kenton, 2019).

Obviously, investing in HRP is one of the most crucial decisions an organization can make because "a company is only as good as the employees" (Kenton, 2019), therefore, many organizations especially young companies are undergoing rapid changes especially due to globalization and technological advancement and innovation couple with their inclination to return to their normal positions of efficiency and profitability caused by the last economic downturn. Thus, companies are striving to win and retain the best and most talented employees in order to beating competition, innovate and increase productivity and profitability (Armstrong and Stephen, 2005). However, the human resource department of many large organizations are developing their HR

Plan with the notion of attracting the most lucrative employee for efficient workforce.

Obviously, some national organizations continue to develop and change their HR Plan to attract and hire quality candidates and as well position them appropriately through periodic examination of employment needs, forecasting demand and supply of employees, and enhanced policies of recruitment, training, performance appraisal and benefits (Maharjan, 2018). Furthermore, to get the best outputs the HR Plan of many organizations now include attractive compensation and benefits packages rooted in their organization's culture, purpose and values because compensation and benefits are essential in the recruitment, retention and motivation of employees (Lonsdale & Milano, 2016).

Certainly, effective training of employees is crucial to the long-term success of any organization, thus, carefully planned and properly implemented training programs provide multiple benefits for the employees (Anderson, 2012). HR Plan benefits the company because it leads to clear understanding of the company's policies, job functions, goals and the company's philosophy thus leading to increased employee motivation, morale and productivity as well as higher profits for the organization (Muzumdar, 2017). Certainly, companies with the most strategic training programs will develop the needed skilled workforce to cope with the challenges of the fast complex technological changing business environment.

Furthermore, being a preferred employer is integral to competing for talent, because job applicants do not like to take jobs with employers who have little or no defined HR plan and employees discriminate against employers who take their contributions for granted (Maina & Kwaisira, 2015). However, candidates prefer to apply for job openings with clearly defined recruitment processes, descriptions of their work duties, opportunities for growth and development, and company's policy on compensation and benefits (Maina & Kwaisira, 2015). Therefore, to be a preferred employer, the HR Plan should be structured in way that it will attract the most desired talents from candidates, and fortified with the elements that will fulfill people training and development, compensation and benefits needs (Maina & Kwaisira, 2015).

Apparently, organizations continue to embrace performance management as a holistic, largely participatory and goal congruent process of managing and supervising employees, however, it is viewed as a methodical, structured procedure to the management and reward of performance through the generation and sustenance of positive employee motivation (Narayana, 2010). Moreover, organizations are adopting performance measures that will lead to the most accurate appraisal of their

employee performance because it is through performance measurement outcomes that employee's future training mostly depends on (Anderson, 2012).

This project focuses on HR plan for Scrummy Food, Inc. with the view of providing the company with a fundamental Human Resource Plan in the areas of recruitment and selection, training, compensation and benefits, performance management respectively. This project is essential because it will supply Scrummy Food, Inc. with cutting-edge HR plan essential for the attraction, recruitment and retention of some of the most knowledge and skilled employees necessary for achieving its long term goals of productivity and profitability.

II. DISCUSSION

Scrummy Food, Inc. is a foreign owned food packaging and Distribution Company located in Europe, it was established 5 years ago. The company currently employs 250 people and has a combined revenue of \$12,800,000 and profit of \$1,600,000 annually. Scrummy Food, Inc. is a company that packages, sales, and distributes various types of foods in major designated areas of the state such as canned food, grains, tubers, vegetables, and snacks, carbonated and non-carbonated drinks.

Scrummy Food a is growing company with the prospect of becoming one of the leading food distribution companies, however, it intends to acquire more distribution trucks to enable it attain its desired status of a big food distribution company. The company plans to hire more employees in the future to enable it pursue its expansion drive, however, the company is currently operating mostly with traditional employees, Therefore, many of its employees are yet to establish a long-term career goal with the company due to lack of well-established human resources department with a goal oriented human resources manager. Obviously, Scrummy Food, Inc. faces brand competition from other companies who also fight along with it to gain market niche and win the acceptance and admiration of customers, to remain on top. The company faces competition from other food distribution

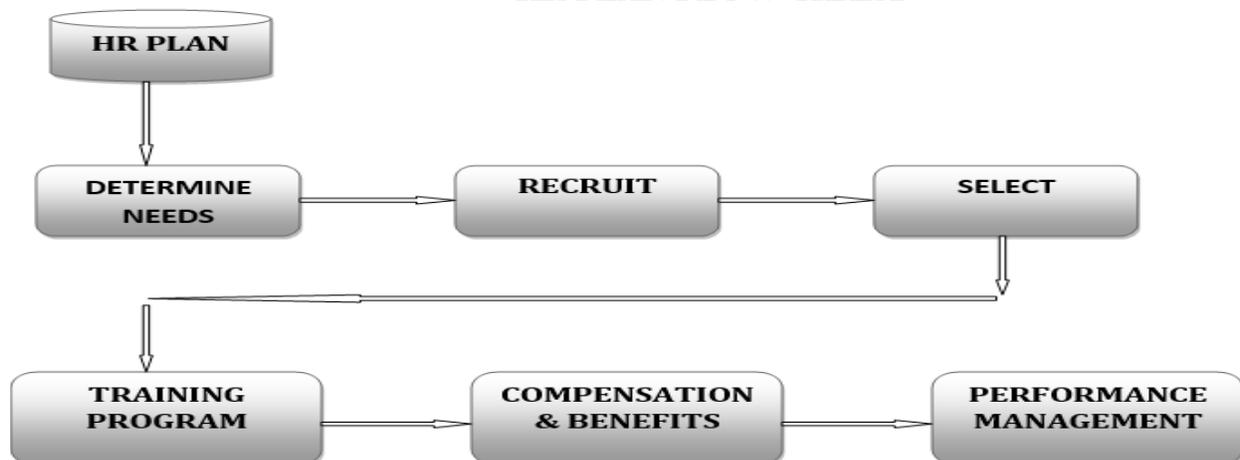

companies especially those that have stayed in business for years before its establishment.

III. DETERMINING HUMAN RESOURCE NEEDS

The first step of HR plan should involve the determination of the number of people needed to be hired coupled with order factors, thus, this step entails examination of Scrummy Food operations over the last year and pondering on specific questions to determine whether enough people were hired, whether the HR struggled to hire people at the last minute (Green, 2016). More so, this is the time to determine the company's current employee skills, the skills the employees need to gain to keep up with technology, the number of employees to be replaced due to retirement and whether there is someone available to replace them, the company's sales forecast and whether it might affect hiring (Green, 2016). To obtain accurate estimate of recruitment needs for now and in the future, other departments, managers and executives should be involved. Thus, it is a management function to assist the human resource manager to develop the HR Plan in order to recruit, select, train and develops employees for the company (Kenton, 2019).

To help determine the exact number of employees due for retirement and who will be absent needing temporary replacement, Scrummy Food should prepare an inventory of all current employees including their educational level and abilities because this will give the manager the big picture of what current employees can do (Kenton, 2019). Thus, keeping inventory will assist the HR manager to know where there are the likelihood for the existence of gaps and enables the filling of such gaps, more so, it can serve as a tool to develop employees' skills and abilities (Green, 2016). The company should also conduct job component analysis to fully understand the types of employee skills required to perform the job successfully, however, after the performance of the needs assessment and the comprehension of the exact number of people that will be hired, into what positions and time frame they need to be hired (Kenton, 2019), the next thing is recruitment.

HR PLAN FLOW CHART

IV. RECRUITMENT AND SELECTION

Recruitment and selection is directly linked to an organizations performance, productivity, profitability and turnover, however, finding the right candidate requires prudent planning, organizing, directing and control before the interview process, to ensure the hiring of trusted candidates with good proven track record, people oriented traits and good communication skills (Elsie, 2017).

The recruitment and selection program starts with the assessment of needs, and definition of the needs and requirements for new workers and professionals for outlined job postings, more so, roles, responsibilities, skill sets and qualifications are carefully developed and defined (Jaiswal, 2013), thereafter, the job vacancies are made known and advertised accordingly.

V. RECRUITMENT

Recruitment is the process of the identification of vacant positions and taking of steps to filling such vacancy in the organization (Maharjan, 2018). Recruitment is the process of searching and appointing prospective candidates in an organization (Jaiswal, 2013). In addition, recruitment is a continuous process during which companies try to develop a pool of qualified applicants in anticipation of future human resources needs even though specific vacancies do not exist (Jaiswal, 2013). Apart from recruitment through *Internal Sources* which is notorious among organizations, Scrummy Food should use an enhanced recruitment technique through *External Sources* of recruitment, this is necessary to attract more potential job seekers. Scrummy Food' external sources of recruitment should comprise; a) Direct recruitment, or Campus recruitment, b) Indirect recruitment, c) Placement consultants, d) Head hunter (Jaiswal, 2013). In the direct recruitment method candidates will be screened and shortlisted from the Institutions, while in the indirect recruitment, the human resource department places advertisement in the Newspaper, Magazines, and the news media such as Radio, Television, and Internet and social media sites such as LinkedIn, Facebook, and Twitter and its company website (James, 2018). In the placement consultant, jobs will be placed with consultants who undertake the job of identifying suitable candidates for the company (Anderson, 2012). More so, head hunters will be used to recruit candidates especially nationally since they also specialize in matching jobs with people (Green, 2016).

Obviously, these outlined recruitment methods will enable Scrummy Food to attract a diverse group of candidates willing (Anderson 2012) to apply as potential employees, however, after receiving applications from job applicants, the selection process takes place. In doing recruitment, irrespective of the location or place, it is important to note that recruiting should be fair and equitable, more so, diversity should be considered (Muzumdar, 2017). Once recruitment is complete selection follows next.

VI. SELECTION

Selection is the process by which qualified and suitable employees are chosen and placed on the jobs in accordance with their competencies and company's requirements, according to

Thomas Stone, "Selection is the process of differentiating between applicants in order to identify those with greater likelihood of success in the job" (Agarwal, 2019). In addition, selection is the procedure of selecting the best candidates from the pool of job applicants, however, Selection is a tool in the hands of management to differentiate the suitable and unsuitable applicants by applying various techniques such as group discussions, personal interviews (Agarwal, 2019).

Once the desired number of applicants successfully applied to the advertised vacancies, the human resources manager of the company should ensure appropriate review of the applications without bias. During the review HR manager should consider important factors such as work experience, education, certification, and credentials of each applicant to make sure each applicant is fit for the job (Anderson, 2012), more so, the applicants culture should be considered because for making a smooth transition having similar culture is key (Anderson, 2012). Reference checks are also conducted which is necessary to gather factual evidence from third parties who have observed the candidate at work (Elsie, 2017). Besides, background and credit checks should be conducted to determine whether the applicant is legally qualified to work in the United States and to determine his credit history which is a predictor of his ability to meet obligations (Elsie, 2017).

Once the review process is complete applicants should be asked to complete an online tests and a comprehensive personality questionnaire (*but to cut cost and save time, the test and personality questionnaire should be done along with the application form*). However, the online test and personality questionnaire is to determine the applicant's suitability because the human resource department should apply evaluation tools before arranging for the final interview, so that it can properly predict the future behavior of the employee in the workplace (Elsie, 2017).

The tests should include *Cognitive Ability Test* - an assessment that measure a variety of applicant mental abilities such as verbal and mathematical abilities and reading comprehension (Pulakos, 2005). *Job Knowledge Test* which measure critical knowledge areas required to perform a job effectively, *Personality Test* which assess an applicant's qualities such as industriousness, extraversion, friendliness, openness to experience and emotional ability (Pulakos, 2005) important for job performance, and *Biographical Data Test* which ask applicants questions relating to their personal; background, characteristics or interest (Pulakos, 2005). All these tests should comprise mostly multiple-choice questions.

Those who are found suitable and best fit for the jobs after the online tests having passed their background and reference checks in particular, should be sent invitations to come to the company's site, for interview on a specified date and time. The interview should be structured, which is designed to ask applicants different types of interviewing questions in order to and provide information to determine the verbal communication potency of the candidate and to ascertain whether his/her tone is of consistent audibility at all times (Elsie, 2017).

The interview should depend on the resume of the candidate regarding experience with specific questions asked such as; how did you hear about us? Have you worked for Scrummy Food before? How many years of working experience do you

have? (Glassdoor, 2019). Why did you leave your last job? (Haden, 2019) and more. Depending on the position being hired, the candidate should also be evaluated on; *Product knowledge* question such as, do you have some industry or related industry experience or education? (Haden, 2019). *Management ability* question such as, how many people have you managed before? Do you feel comfortable managing other people? (Glassdoor, 2019), *Ability to prospect* questions such as, how you would get a qualified potential buyers for this company? (Glassdoor, 2019). *Problem solving* questions such as, do you understand a problem fully before trying to find solution to it? (Enns, 2019). *Reporting* question such as, do you communicate information back to management in a timely manner? (Haden, 2019). *Diversity* questions such as, describe what diversity and inclusion means to you, and why it is important in this position? (Enns, 2019).

Furthermore, the human resources staff should ask the candidates to complete short-form similar follow-up test comprising of few questions under his or her supervision (depending on where the application took place) to verify performance between the two test results (Glassdoor, 2019). More so, the candidates who successfully passed the final interview gets selected for the jobs, however, at this point salary, benefits, vacation time may be negotiated (Green, 2016), or they should be sent offer notifications with the date of orientation.

VII. TRAINING PROGRAM

There is a dynamic change in the talent's landscape due to global developments such as urbanization, demographic changes, and technological innovation, however, these trends result to shifts in the supply of talented employees when demand for skills is increasing sharply (Duggan, 2018). More so, through effective employee training programs HR professionals could offer employee supports in the most cost-effective and consistent manner (Duggan, 2018). Managing a business has become increasingly complex in today's global economy. Obviously, as industries become digitalized and tasks become automated, there is a shift in the kinds of skills required by organizations, with profound implications for how individuals will approach their career paths (Zhao, 2019). Besides, according to a recent report by McKinsey Global Institute titled, *Jobs lost, jobs gained: Workforce transitions in a time of automation*, indicates that by 2030 as many as 375 million workers or approximately 14 percent of the global workforce may need to switch occupational categories, however, many companies are facing a shortage of talent (Zhao, 2019).

Skilled and talented workforce is the greatest assets an organization has. Therefore, many young companies conscious for sustainable growth pay adequate attention to the training of their employees, as they are committed to providing them with opportunities and experiences that strengthen their skills and capabilities (Elsie, 2017). Obviously, 94 percent of employees would stay longer at a company if it invested in their career, through training (Zhao, 2019) alone which is the panacea for employee development.

Employee trainings are done for three main reasons: a) to ensure that employees have the skills needed to do the jobs today, b) to ensure that employees have the capabilities to support future business growth and c) to keep talented employees aboard (Zhao,

2019). Moreover, Scrummy Food should analyze training requirements to ensure the development of new training programs or modifications of the already existing ones (Duggan, 2018). The company should train instructors and supervisors in techniques and skills for training and dealing with every employee, and conduct an orientation sessions and arrange on-the-job training for new employees (Elsie, 2017). Furthermore, Scrummy Food should establish employee development programs, using the knowledge of effectiveness of methods such as classroom training, demonstration, on the job training, conferences, and workshops (Muzumdar, 2017).

Scrummy Food should develop and arrange training manuals, multimedia visual aids, educational materials, and testing and evaluation processes (Duggan, 2018). Besides, it should use the result of its periodic reviews to engage employees about the kinds of career opportunities the employees' desire, and incorporates their desires into the training program (Muzumdar, 2017). More so, Scrummy Food needs to include soft skills such as critical thinking, creativity and complex problem-solving to navigate through unforeseen challenges because while technical skills and competencies are needed, modern businesses require employees who are skillful in a variety of things (Zhao, 2019).

Scrummy Food needs to maintain sequence planning and benchmark strength for the workforce to make sure that the company is effectively resourced for the future in accordance with management development and career planning goals coupled with future demands of the company (Muzumdar, 2017). More so, it should set well-defined goals for the training program, and communicate the benefits and purpose of the program clearly, to all employees (Zhao, 2019)

The outlined training procedures are necessary because Scrummy Food appears to be one of the companies that still relying on dated, long-form training content that's subpar to the standards of today's workforce (Zhao, 2019).

VIII. COMPENSATION AND BENEFITS

The purpose of compensation and benefits systems is to align the performance of the organization with the way it rewards its employees, thus, providing the essential incentives and motivation required of an organization to achieve its goals (Allen, 2002). An organization's life cycle might determine its compensation strategy, thus, the supply and demand of desired skills in the market, economy, region or location where the company is located is a determinant factor in compensation strategy (Green, 2016). However, organizations must design compensation systems that motivate employees and embody fairness to everyone in the organization (Lonsdale & Milano, 2016).

Clearly, because of budget constraints, organizations cannot offer every benefit and incentive. Therefore, Scrummy Food should only offer comprehensive compensation and benefit packages whose components are a combination of base pay bonuses, profit sharing, share options, and a range of appropriate benefits (Allen, 2002). Such healthcare benefits should have reduced employee contribution determined usually based on market or competitor norms and the organization's ability to pay (Allen, 2002) and sick leave.

The company's reward program should incorporate employee recognition incentive schemes such as Employee of the Week, Employee of the Month, and Employee of the Year, team bonuses (Indiana State University, 2019). Moreover, there is need for other incentives such as award of points to employees that are based on performance, travel allowance, retail vouchers and coupons that may be exchanged for activities or trips (Allen, 2002). Obviously, poorly developed reward system might lead to increased employee anxiety and hostility, and eventual meagre use of both human and non-human resources, increased costs, and reducing productivity (Amiller, 2010). Nonetheless, there is evidence that companies view compensation as a strategic management lever and are increasingly experimenting with new practices geared towards the improvement of performance or skills of the workforce or reinforce culture or behavior change (Allen, 2002). The compensation program must accommodate diversity and shun all forms of discrimination.

Due to diversity Scrummy Food benefit packages should be structured to be attractive to all generations because compensation and benefit programs are essential in the recruitment, retention and motivation of employees, and such benefit plans should buttress their organizations culture, purpose and values (Lonsdale & Milano, 2016). Accordingly, organizations faces the challenges of designing employee benefits packages that will be suitable to the various levels of employees who are especially of different age groups (Lonsdale & Milano, 2016). Therefore, an organization's planning of the appropriate compensation and benefits for the current multicultural, and multi-generational workforce (Lonsdale & Milano, 2016) should be done prudently putting into considerations diversity.

Scrummy Food employees should be provided with voluntary benefits packages whereby employees are allowed the options to select benefits best tailored to their personal and perhaps family needs. Certainly, diversity in the workforce impacts the development of employee benefits packages by making an increasing number of employers to provide flexible benefits packages, a reflection of the understanding of employees' divers' needs that demand for different benefit packages (Indiana State University, 2019).

IX. PERFORMANCE MANAGEMENT

Performance management as a continuous and on-going function in an organization, it is an important tool for organizational success and productivity (Elsie, 2017), besides, it assist the organization in the identification of the right capabilities and retention of competitive knowledge for sustainable future (Narayana, 2010). (Băgu, Cătălina & Grigore, 2014) defined performance management as a planned and incorporated approach to delivering sustained success to organizations through improving the performance of the people who work in them and by developing the competences of individuals and teams. In addition, performance management/appraisal is the evaluation of an individual's performance in a systematic way (Elsie, 2017). Thus, it is a methodical and periodic way of conducting an unbiased rating of an employee's excellence in matters relating to the employee's present job and his potentialities for improvement on the job (Bhosle, 2012).

Performance appraisal at Scrummy Food should be designed with the objective of assisting employees with constructive criticism and guidance for the purpose of their improvement, for enhanced communication between employees and their leaders, and for improved understanding of personal goals and concerns (Elsie, 2017). Scrummy Food should have its performance management system incorporate the following phases; *Planning, Developing, Monitoring, Rating* (Elsie, 2017) respectively. However, Scrummy Food needs to create and install a reboots performance management procedure that sets out performance objectives for all employees (Allen, 2002). Besides, The HR manager must make sure that all the managers in the company receives training on how to fill out the assessment forms, particularly how to discuss job performance with the employee

Scrummy Food should put in place strategic plan for the flexible workforce, with clearly stated job description, total time allowed to be worked per week or per month, and the organizational goals (Elsie, 2017). More so, the company should set out its performance standard and ensure that employees meet the company's expectations (Elsie, 2017). The manager must notify newly hired employees how their jobs are to be performed and their capabilities in meeting the company's expectations should be evaluated as work performance later (Elsie, 2017). Scrummy Food should monitor the employees' job performance and with provision of adequate periodic feedback to them, in order to improve and maintain their work performance (Elsie, 2017). According to Allen (2002) the most critical aspect of performance management is a robust performance review process that gives employees feedback about the level of their achievement and what areas that deserve improvement.

Scrummy Food should conduct proper assessment of employees performance using the most appropriate and accurate rating method, however, the performance should be measured using the 360 or 720 degree appraisal technique for the most accurate result (Elsie, 2017). 360 or 720 Degree performance appraisal method is the assessment of employee performance from all the aspects and giving timely feedback to ensure that the person is able to achieve the set goals before the next appraisal (Anupama, Binu & Dulababu, 2011). Moreover, unlike the previous methods that did not guide the employee, 720 Degree appraisal aims at monitoring, measuring, giving feedback, inspiring employees to accomplish the objectives and for the organization in turn (Anupama et al. 2011). However, the fundamental need of the 360 or 720 Degree performance appraisal is the improvement of the employees in their jobs and ensuring that employer's expectations, and that of the employees and customers are met (Anupama et al. 2011). Furthermore, the Scrummy Food should put in place plans for the improvement of work related skills or knowledge for the employees, to encourage them to grow their performance standard and quality of work to meet the company's objectives (Elsie, 2017).

Performance management reflects organizational performance, and it provides a link and rational for other HR activity, and the highest opportunity to directly affect business success, enhancing HR's reputation and contribution (Elsie, 2017). Scrummy Food should establish a robust performance management strategy because performance indicates the level of employees expertise, and performance is used for; compensation adjustment, promotions, how well the HR is functioning,

feedback, job design errors and deficiencies – bad performance implies weakness in the personnel department’s staffing procedures Bâgu et al (2014).

Diversity

Human resource manager’s main role is in management and leadership that creates and empowers a diverse culture, thus, a culture that is respectful and inclusive and offers every employee the chance to learn, grow and contribute to the company. However, workplace diversity affects the development of interpersonal relationships, the nature of interaction and relationship between managers and employees, it also impact human resource functions, and however, workplace diversity increases HR duties in many ways, and holds the department of human resources accountable for functions mandated by law. Diversity can assist organizations to gain a competitive edge in global markets and when targeting business segments that require input from diverse perspectives. HR expertise is useful in evaluating where candidates should be placed in a company in order to extract the most valuable contributions from them. Indeed, the workplace is becoming increasingly more global, therefore, diversity translates into a competitive advantage for companies who embrace it, because it enables those companies to find and leverage untapped opportunities (Stevenson, 2019). More so, diversity offers companies the opportunity for the identification of new trends, thus, diversity increases motivation, reduces absenteeism and increases productivity levels by creating an inclusive environment (Stevenson, 2019). The first step in enforcing workplace diversity in the workplace is to ensure that published notices about workplace diversity are posted in conspicuous places throughout the workplace such as break rooms, restrooms, parking lots, and walkways. Obviously, the posters furnishes employees with the information about their civil rights, federal and state laws that stresses equal opportunity for employment, irrespective of national origin, genetics, race,

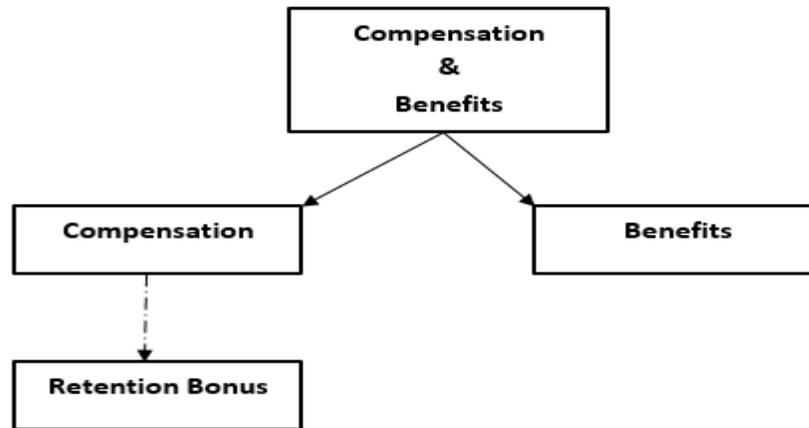

religion, sex, sexual orientation and veteran status. Moreover, HR should conduct periodic walkthroughs to ensure that the company’s posters are intact and up-to-date. Besides, the company’s recruitment advertisements should also reflect the message that the company is an *equal opportunity employer*, this procedure will encourage divers’ job seekers to submit their resumes for considerations.

The company should develop written affirmative action programs that include record keeping obligations for applicant logs, adverse impact analyses and workforce utilization calculations to support the company’s outreach efforts to achieve workplace diversity (Mayhew, 2019). Certainly, managing a diverse workforce can contribute to increased employee/staff retention and productivity, besides, it enhances the organizations responsiveness to an increasing diverse array of customers, improve relations with the surrounding community, increase the organization’s ability to cope with change, and expand the creativity of the organization.

Human Resources should contract diversity consultants or experts or evaluate training modules that are suitable for the workforce, and in situations whereby certain jurisdictions prohibits particular trainings, HR should be involved in the determination of whether to make diversity training mandatory, because the decision to mandate workforce training is a strategic function of HR since it involves the assessment of the workplace climate and whether supervisors and managers would benefit from mandatory training or if informal activities are enough to buttress the organization’s workplace diversity values (Mayhew, 2019). More so, HR manager should monitor diversity which might be done through audit, not only for current employees, but in recruitment practices as well, certainly, monitoring diversity enables progress to be measured effectively (Stevenson, 2019). In a global marketplace, there is more likelihood for an organization to be able to meet its customers’ needs and gain access to new markets with a diverse workforce, in addition, bringing in talent into the workplace whose experience or background pertains to these new markets could be an effective solution to accessing these markets because differing skills are needed to break initial barriers to entry. Apart from recruitment and selection, training, compensation, and performance appraisal, diversity should also be incorporated in other areas such as mentoring, supplier chain diversity, development and leadership to make sure that the company is aiding ethnic minority progression.

Retention Bonus

The gradual scarcity of skilled employees with expert experience has forced many companies to adopt retention bonus as the most assured way of retaining skilled employees, thus, most organizations find losing good employees worrisome irrespective of the size of the existing labor pool or state of the economy (Lohrey, 2019). Obviously, many organizations have discovered the benefits associated with offering retention bonuses and therefore they currently see it as a successful tactic for retaining important employees (Schechtman, 2019).

A retention bonus is a form of financial incentive designed to keep an employee at a company, however, retention bonus is generally given during stressful times at an organization such as acquisition or merger, and they may be offered to important employees intending to leave the company. Obviously, organizations may offer a significant bonus in order to keep key employees, nonetheless, these bonuses are singular transactions in order for an organization to express its appreciation for a job well done. During an acquisition or merger, retention bonuses are usually given as opposed to salary raises because the company might be short off the necessary finances required to commit to a permanent raise.

Without the payment of retention bonuses there is increase likelihood of the erosion of good skilled and talented employees from the organization. Accordingly, a 2016 *World at Work Survey* shows that, of the 673 respondent received, 74% of companies use retention bonuses, and that 77% of respondents offering retention bonuses did so at the discretion of management (Lohrey, 2019). Moreover, Scrummy Food should establish retention bonus programs basing it rate depending on the financial state and information on what competitors are paying (Lohrey, 2019). Information obtained from Salary.com indicates that retention bonuses are normally about 10 to 15 percent of salary (Lohrey, 2019).

X. CONCLUSION

An efficient HR plan is the most essential aspect of Scrummy Food growth strategy as a young company, for employee recruitment, provision of leadership and direction to the employees of the company, and to ensure thorough training of its employees and to provide them with career development as well as compensation and benefits options. Besides, it will assist the company to ensure that it has the proper ongoing recruitment and selection processes, performance evaluation methods, compensation and benefits programs, and most regular training and development programs for employees.

A standard HR plan will assist the HR manager to ensure that performance appraisals are going on continually thus enabling employees to understand the level of their inputs and to make needed necessary corrections. More so, it will assist the company to ensure that the right people are hired as need arises, emphasis

on improving the skills with the intention of equipping them with the skills needed in future for the attainment of the company's goals. Furthermore, it will enhance the company's productivity and reduces employee turnover by attracting the best employees in place. Obviously, diversity has become an intricate part of the HR plan as it is directly related to the company's productivity, profitability, public perception and external relations, more so, the inclusion of retention bonuses in the HR plan is necessary to ensure the retention of some of the highly valued employees who are viewed as assets to the company.

ABSTRACT : The purpose of this study is to show the influence of organizational culture and transactional leadership style and to know the variables that have dominant influence on the performance of employees of PT. Pegadaian (Persero) Regional Office III Palembang. Qualitative data is used in this study in the form of a questionnaire with the use of the Likert scale. In this study the population used is all employees of PT. Pegadaian (Persero) Palembang Regional Office III as many as 105 respondents with saturated sampling technique. The results obtained are organizational culture and leadership style able to influence the performance of employees of PT. Pegadaian (Persero) Palembang Regional Office III positively and significantly. The results of the F test show that together the variable organizational culture and transactional leadership style can significantly influence employee performance

KEYWORDS : organizational culture, transactional leadership style, employee performance

INTRODUCTION

The number of human resources (employees), an organization must think of ways to be able to utilize and optimize the performance of employees. This is because employees are one of the important assets needed by the organization to carry out the production process which is a problem is how to produce employees who have optimal performance. Optimal employee performance is one of the goals of the organization to achieve high work productivity.

Employee performance effectiveness can be influenced by an organization with a strong culture. In addition, the application of culture in a company will also shape the character of its employees by themselves in carrying out their duties and achieving the goals of the company. In addition to organizational culture, leadership style also affects employee performance in a company.

According to Stephen P. Robbins (2016), leadership is the ability to influence a group toward achieving goals. On the side of Maulizar (2012; 4) argues that the concept of leadership that is growing rapidly is the concept of transactional and transformational leadership which was later popularized by Bass in 1985. Transactional leadership refers to the concept of barter between leaders and staff, good subordinate performance is the leader's expectations, while staff expect economic rewards and rewards from the leader. Whereas transformational leadership refers to the concept of subordinate development.

PT Pegadaian (Persero) Regional Office III Palembang is an Indonesian state-owned financial sector engaged in three business lines of the company, namely financing, gold and various services that have operational areas covering 5 provinces, namely South Sumatra, Bandar Lampung, Jambi, Bengkulu and Bangka Belitung Like other operational areas. In line with the improvement of the strategic initiative program 2019, Palembang Regional Office III made the planned target to be increased in terms of quantity and quality so that all elements of management and workers must understand so that the company's target, vision and mission can be carried out properly.

PT Pegadaian (Persero) has a good organizational culture and has been used as a guide and direction to be adhered to in achieving organizational goals, but informally there have emerged unhealthy cultures such as employee mentality which have resulted in less creative and innovative behavior, less attitudes respecting colleagues and leaders, lack of discipline, and lack of competencies related to understanding corporate culture. This results in employee performance not being optimal, such as unfinished work on time and the quality of work that does not meet the standards.

Apart from unhealthy cultures, there are also behaviors of the low performance of PT Pegadaian (Persero) employees. in the form of lack of responsibility for carrying out tasks, procedural deviations from SOPs, low discipline.

PT Pegadaian (Persero) performance data in Regional Office III Palembang that PT Pegadaian (Persero) Palembang Regional Office III has 32 branch offices spread in 3 cluster areas namely Palembang, Jambi, Lampung. Overall there are 93.75% or 30 branch outlets that do not reach the set target. There are even around 25 branch outlets that get realization below 80% of the target set. The best achievement came from 2 outlets that managed to record the realization above 100% of the target set.

The lack of achievement of PT Pegadaian (Persero) performance in Palembang Regional III Office according to the possibility caused by several things, such as: employers who are less able to influence employees to be disciplined and comply with rules set by the company and the ability to bring employees to the goals to be achieved by the organization. The lack of functioning of the organizational culture that has existed in the organization as a norm in behaving in the organization, and the lack of education and training that can provide additional knowledge for employees to achieve the expected target.

The indicator of employee performance measurement according to Robbins (2015) in the form of work quality, timeliness, initiative, capability and communication becomes a matter that needs special attention so that companies can compete with other companies in the current era of globalization.

LITERATURE REVIEW

Organizational culture

According to Boke and Nalla (2011) organizational culture can be measured by five indicators as follows: (1) regulations are implemented uniformly for all parties without regard to certain conditions or certain problems. (2) Distance with superiors, each employee can freely express opinions and ideas that are different from his superiors. (3) trust where employees are open to other employees. (4) professionalism by carrying out work with very good quality can develop employee capabilities. (5) integration where employees are friendly in their association.

Human resources are part of a culture that affects each other. That is because the culture that forms the predecessors in the organization then creates norms and values according to ideology that can help in achieving organizational goals.

In the end the culture formed will affect human resources and then new resources in the organization can influence the formation of culture itself.

Transactional Leadership Style

According to Robbins & Judge (2015) transactional leadership style is a type of leadership where leaders integrate or motivate their followers in the direction of goals that are upheld by clarifying the roles and demands of the task. In Robbins & Coulter (2012: 497), transactional leadership is a leader who guides and motivates followers in the form of appreciation for their productivity / performance.

Employee performance

Performance is a work performance or a real achievement achieved by someone. According to Robbins (2012), performance is the actual performance of employees compared to the expected performance of employees.

Dimensions of employee performance according to Robbins (2016), namely as follows:

1. Quantity

Quantity is a measurement of the performance of an employee by assessing the quantity of work completed in a period.

2. Quality

Quality measurement of an employee's performance by assessing the quality of work performed as expected.

3. Timeliness

Is a measure of performance based on the accuracy of the time planned. Timekeeping measurement is a special type of quantitative measurement that determines the timeliness of completion of an activity. We can see this from the level of employee attendance, employee compliance at work.

RESEARCH METODOLOGY

In accordance with the issues to be discussed and so as not to widen the discussion, the authors need to make the scope of the discussion only on the aspects of relationship Organizational culture and Transactional leadership style on the performance of PT Pegadaian (Persero) Regional III Palembang employees.

Data source

1. Primary data is a source that provides data to researchers found from direct observations or observations to PT Pegadaian (Persero) Palembang Regional Office III, besides that the author distributes questionnaires and interviews directly to employees of PT Pegadaian (Persero) Regional Office III Palembang.

2. Secondary data, namely data that has been collected in advance from other parties such as the company's official website, journals relevant to research, articles in newspapers, HR management books related to the object of research.

Population

In this study the population used was employees of PT Pegadaian (Persero) Palembang Regional Office III as many as 105 people.

RESULTS AND DISCUSSION

Coefficient of Determination (R²)

Table 1. Coefficient of Determination (R²)

Model	R	R Square	Adjusted R Square	Std. Error Of The Estimate
1	.583 ^a	.340	.327	5.578

From the table above explains the value of R² (coefficient of determination) of 0.340 means that the independent variable can explain the effect of the dependent variable by 34% while the remaining 66% (100% -34% = 66%) is explained by other factors not discussed in this study.

Analysis of Multiple Linear Regression

From the test results, the equations that can be formed are as follows:

$$Y = a + b_1X_1 + b_2X_2$$
$$Y = 26.208 + 0,1986X_1 + 0,381X_2$$

From the results of the equation, it is obtained that the constant results of 26.208 are positive which means that the independent variables of organizational culture are 0.196 and transactional leadership is 0.381 against the dependent variable of employee performance.

Model Feasibility Test (F Test)

In principle, F-test analysis (ANNOVA) is used to show the effect of organizational culture variables and transactional leadership styles on employee performance. The following testing criteria:

- If prob F is greater than 0.05 it means no significant effect
- If prob F is smaller than the meaning it has a significant effect

The following are the results of ANNOVA testing which can be seen in the table below:

Table 2. F Test

		ANNOVA ^b				
Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	1632,965	2	816.482	26.239	.000^a
	Residual	3173,950	102	31.117		
	Total	4806,914	104			

Independent Variable : Organizational Culture and Transactional Leadership Style
Dependent Variable : Employee performance

The results of multiple regression tests on the level of confidence of 94% obtained a value of Fcount of 26.239 greater than the value of F table. The results of F table are 2.69% calculated from $(n-k) = 105-3 = 102$ and F count is 26,239 with a probability level of 0,000 which means that Fcount is greater than F table and Prob Significance is smaller than 0.05. it can be concluded that the independent variable (Organizational Culture and Transactional Leadership Style) has a significant effect on Employee Performance.

Individual Parameter Significance Test (t Test).

The t test basically shows how far the influence of an explanatory variable is (variable X1, X2) partially (individually) in explaining variable variations bound.

Table 3. Regression Coefficients

Model	Coefficients			t	Sig.
	Unstandardized Coefficients	Std. Error	Standardized Coefficients		
1	B		Beta		
	(Constant)	26.208	4.551		5.759
	Organizational Culture	0,196	0,070	0.262	2.804
	Transactional Leadership Style	0,381	0,088	0.403	4.307

Dependent Variable : Employee performance

Data Source: Processed from the Questionnaire

From the results of the t test it can be concluded that:

1. Beta value in the organizational culture variable is 0.262 with the sig value. 0.006 smaller than 0.05. meaning that organizational culture can affect employee performance positively and significantly.
2. The beta value of the transactional leadership style variable is 0.403 with the sig value. 0,000 is smaller than 0.05. meaning that transactional leadership styles can affect employee performance positively and significantly.

CONCLUSION

The results of the assessment of multiple linear regression analysis with two independent variables namely organizational culture and transactional leadership style and one dependent variable of employee performance indicate that organizational culture and leadership style variables have a positive and significant influence on employee performance at PT. Pegadaian (Persero) Regional Office III Palembang.

SUGGESTION

Based on the results of the research, and the conclusions above, the researcher can propose a number of suggestions as follows:

1) For PT. Pegadaian (Persero) Regional Office III Palembang

Leadership style at PT. Pegadaian (Persero) Palembang Regional Office III that needs to be done by the company is to maintain the existing conditions and improve this condition towards a better one. Leaders must pay more attention to policies that are in accordance with procedures and give authority to their subordinates to make decisions together. In addition, leaders should pay more attention to the ongoing work process, where leaders can clarify goals and communicate the objectives and expected results. So that it can create participation and communication between superiors and subordinates.

2) For Further Researchers

For the next researcher can examine organizational commitment, training and so on and can expand the sample to strengthen and produce good research.

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9237>

Abstract- Employee Turnover Intention is recognized as one of the strategic and critical issue in competition among organizations especially in the hotel industry in Sri Lanka. Therefore, organizations try to minimize their turnover ratio in order to save their cost, consists of hiring, recruiting and selecting the employees. Thus the study mainly focuses about two objectives as to identify the impact of the non-financial rewards on employee turnover intention as well as to identify the mediating effect of intrinsic motivation on the relationship between non-financial rewards and the turnover intention. The sample consisted of two hundred operational level employees working in Sri Lanka Tourism Development Authority (SLTDA) resisted five star hotels. The data were gathered by self-administrated questionnaire and the data were analyzed by using simple regression analysis as well as Baron and Kenny mediation analysis method. The analysis exposes that there is a strong negative relationship between the employee non-financial rewards and turnover intention. Mediating analysis results goes to show that intrinsic motivation partially mediate the relationship between non-financial rewards and employee turnover intension. The results help top managers to formulate effective strategies to retain their employees in the long run.

Index Terms- Non-Financial Incentives, Intrinsic Motivation, Turnover Intention, Hotel Industry, Sri Lanka Tourism Development Authority

I. INTRODUCTION

Human Resource is one of the most important and a valuable resource in any organization. They are the source of achieving organizational major goals and competitive advantage because of it has the capability to convert the organizational input into output. The terms of human resources refer to the tangible assets, but they are capabilities take intangible (knowledge, skills, creative abilities, talents, values and beliefs) of an organization's work force environment. The competitors can create other resources like physical materials, technological methods, practices and strategies while the human resources are unique to each and every organization.

Hospitality is a rapidly expanding industry world-wide. It is expected to remain a leading contributor to the global economy by generating desired foreign exchange reserves to the country and same time creating employment opportunities. Development of human resources (HR) remains the most important and significant factor for the success of the hospitality industry of the country. According to the Nankervis & Deborah (1995) Human resources in the hospitality sector require not just a human touch and "service with a smile" but also yearn for individuals who are multi skilled, cross-trained, forward looking in terms of perspective and mindset, and embody strategic creative and systematic thinking. Employees often resist change and prefer to adhere to the traditional values and practices. Many organizations have come forward, and are doing remarkably well in the development of human resources to meet international standards in the hospitality field Tourism Industry.

According to Whetten and Cameron (2007) highlighted that non-financial rewards effectively engage in motivating employees .In 2004 Brown et al. suggested that labour turnover affects both workers and firms. Most researchers proved that employee turnover is one of the major issue related to the hospitality industry. Therefore According to the Khan et al in 2013 suggested that Organization tries to reduce turnover intention through reward climate in the workplace. Simultaneously non-financial rewards establish the linkage with intrinsically motivated behaviour.

Tourism income is one of the important segments that contribute to the Sri Lankan economy. Recent trends of Sri Lankan Gross Domestic Production (GDP) shows a significant role which played by the service sector indicating over 60 percent contribution. According to annual research statistics of 2017, tourism' total contribution to GDP was recorded as 13.5percent. And also tourism' total contribution to employment was increased by 2.8percent with comparing 2016. It is proved that high number of

employment opportunities can be seen in the context of hotel industry. Under the research area researcher selected 5 star categorical hotels in Sri Lanka. According to the Sri Lanka tourism development authority (SLTDA) annual report in 2019, there are 23 registered 5 star hotels can be identified. his article guides a stepwise walkthrough by Experts for writing a successful journal or a research paper starting from inception of ideas till their publications. Research papers are highly recognized in scholar fraternity and form a core part of PhD curriculum. Research scholars publish their research work in leading journals to complete their grades. In addition, the published research work also provides a big weight-age to get admissions in reputed varsity. Now, here we enlist the proven steps to publish the research paper in a journal.

Problem Statement

According to the Ranasinghe & Sugandhika (2018) Tourism income is one of the important segments that contribute to the Sri Lankan economy. Recent trends of Sri Lankan Gross Domestic Production (GDP) shows a significant role which played by the service sector indicating over 60 percent contribution. But Hotel industry faces the problems in developing and maintaining the required manpower. Number of researchers highlighted that, comparing with others hotel industry have considerable employee turnover ratio. Since because of that firm growth and productivity can be reduced.

Barney & Wright (1997) stated that the firm's people are its most important asset. The large number of human contributions can identify in the Hotels, but Labour turnover is the major human side problem. Employee turnover, as defined by Him and Griffith (1994), is 'voluntary terminations of members from organizations'. According to Khatri et al. (1999), turnover intention is occurring when an employee willing to switch their existing job to another, based on their individual desire. One of the major issues which have been part of tourism industry in past is to row out itself from the problem of employee turnover rate. It is said that employee turnover is one silent part of human resource management which can have a negative impact for the organization if managed inadequately.

According to Whetten and Cameron (2007) suggested in the literature of human resource management and organizational behavior that non-financial incentives act effectively in motivating employees .In 2004 Brown et al. suggested that labour turnover affects both workers and firms. Similarly, Khatri et al., (1999) mentioned and Barnett (1995), Chang (1996) Syrett (1994) suggest that employee turnover is a major problem for companies in many Asian countries include Sri Lanka. Every organization tries to reduce turnover intention regarding the reward climate in the workplace (Khan et al., 2013).

In the Sri Lankan context, considerable number of researchers explains the only turnover intention. There is no combination turnover intention, non-financial rewards and also intrinsically motivated behaviour. There is a deficiency of researches related to a particular research area and could find contradictory ideas between variables. It provides knowledge and empirical gap for relevant research problem.

Research Problem

- What is the impact of non -financial rewards on turnover intention of Operational levels employees in Hotel industry?
- What is the impact of non -financial rewards on turnover intention through intrinsic motivation of Operational levels employees in Hotel industry?

Research Objectives

- To identify the impact of non -financial rewards on turnover intention of Operational levels employees in Hotel industry?
- To identify the impact of non -financial rewards on turnover intention through intrinsic motivation of Operational levels employees in Hotel industry?

II. LITERATURE REVIEW

This is important especially when countering the other factor of turnover intentions in the long run. It is a known fact that employees desire a compensation system that they perceived as being fair and commensurate with their skills, experiences and knowledge. Therefore HRM must take note that pay is the main consideration because it provides the tangible rewards for the employees for their services as well as a source for recognition and livelihood. Employee compensation and benefits includes all form of pay, rewards, bonuses, commissions, leaves, recognition programs, flexi work hours and medical insurance (Sherman et al., 1998).

Human resources in the hospitality sector require not just a human touch. Because it encompasses with the “service with a smile”. But also desire for individuals who are multi skilled, cross-trained, forward looking in terms of perspective and mindset, and embody strategic creative and systematic thinking. According to the Nankervis & Deborah (1995) identified that to encourage tourists to choose a specific hotel, the hoteliers must meet or exceed the guests’ expectations of service quality

Turnover intention

Turnover intention is a high degree of problem for each and every organization. Most of the organizations always concerns about their turnover intention deeply. It is a serious human side problem for the organization. A huge number of employee turnover may be harmful to both the organization performs as well as the employees work life. If the organization turnover intention is high, they want to spend extra expenses for recruiting and training new workers. It will be negatively impacted to the organizational cost function and work environment. According to Abassi & Hollman (2000) identified Employee turnover is the rotation of workers around the labor market, between firms, jobs and occupations, and between the states of employment and unemployment. Simultaneously Turnover Intention is defined by Lee (2008) as the subjective perception of an organizational member to quit the current job for other opportunities.

In 2006 Carmeli and Weisberg used the term turnover intentions to refer to three particular elements in the withdrawal cognition process (i.e., thoughts of quitting the job, the intention to search for a different job, and then intention to quit. Sousa-Poza & Henneberger (2002) defined turnover intent as the reflection of the probability that an individual will change his or her job within a certain time period. Although, there is no standard framework for understanding the employee’s turnover process as whole, a wide range of factors has been found useful in interpreting employee turnover Kevin et al. (2004).

Non-Financial Rewards

Rewards are imperative factors that illuminate certain job aspects that contribute significantly to the organization such as job satisfaction (Maqsood Haider, 2015). Rewards are basically categorized into two parts as financial rewards and non-financial rewards. In classifying the non-monetary incentives, the breakdown of on-the-job rewards proposed by Meacham and Wiesen (1969). Non-monetary incentives are the tangible rewards, social practices or job related factors that are used in an organization to motivate employees without direct payment of cash. According to the Depedri (2010) suggested rewards, therefore, involve all economic benefits that are being supplied by the organization-pay, promotion, verbal recognition and responsibilities whether they are financial or not. Non-monetary incentives are rewards that an individual experiences and it is highly and directly effect on the organization itself. (Falola, et al, 2014; Kinicki and Williams, 2003). According to Whetten and Cameron (2007) mentioned about the essence of incentives is to establish linkage with desired behavior and the outcome that makes the employee feel appreciated.

Non-Financial Rewards & Employee turnover

According to Henry Ongori (2007) mntioned about the organization should pay employees based on their performance and in addition they should give employees Rewards like individual bonus, lump sum bonus, sharing of profits and other benefits. Hence, if these are put in place they would minimize employee turnover. Employee turnover can often be conceptualized in terms of different factors. A number of scholars given their own idea about the turnover intention according to their different point of view. Therefore many researchers suggested that there is a link between non-financial rewards & employee turnover.

Non-Financial rewards & Intrinsic Motivation

According to the previous researchers, relationship between non-Financial rewards & Intrinsic Motivation can be identified. In 2013 Khan et al. suggested non-financial rewards play a significant role in the perception of the employee regarding the reward climate in the workplace. Bob Nelson (2001) also supports the view that there is a strong link between non-financial rewards and improved job motivation. Scott Jeffrey’s paper (2002) implies that the use of tangible non-financial rewards might accomplish the objective of motivating employees in a lowest cost better than the market value of that incentive in cash. Brain processes information affects tangible non-financial incentives having a greater impact on people than cash rewards (Alonzo, 2004). Bob Nelson (2001) also

highlighted the view that there is a strong relationship between non-cash incentives and improved job motivation. Stark (2007) regards non-financial rewards as crucial in helping an organization stand out as a top employer, and also have the dual impact of increasing engagement among employees. The essence of incentives is to establish linkage with desired behavior and the outcome that makes the employee feel appreciated in the psychology literature, intrinsically motivated behavior is stated to arise from innate psychological needs, such as needs for competence and autonomy (Deci & Ryan, 1985; Kasser & Ryan, 1996).

III. RESEARCH METHODOLOGY

The research study depended on the survey technique because, according to the nature of the research, the investigator presumed it to be the most suitable technique. The research sample is consisting with 200 operational level employees who are employed in five star category hotels in Sri Lanka registered with the Sri Lanka Tourism Development Authority. The data were collected by using self-administrated questionnaire with five-point Likert scale statements by using convenience sampling method. To assess the reliability engaged in the study constructs, reliability testing was conducted to guarantee measurement reliability. Hence, the reliability of the research constructs in the acceptable level as 0.743 in all the dimensions of the questionnaire.

In order to assess the impact of the non- financial rewards on employee turnover intention of the employees Karl Pearson Correlation coefficient as well as the simple regression analysis was utilized. Moreover, to identify the mediating effect of the intrinsic motivation between the dependent and the independent variable Baron and Kenny four step mediator analysis model was employed. To identify the indirect effect of the mediator researcher used Sobel test analysis.

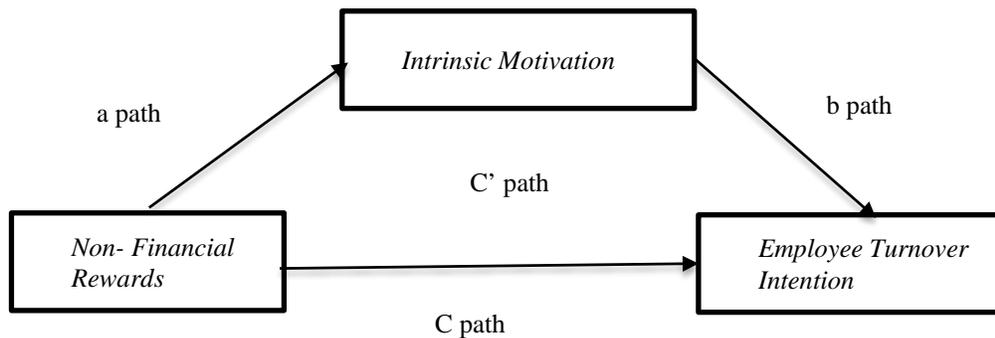

Figure 1-Conceptual Model of the Study
Source: Based on the Review of the Literature

- Hypothesis One: There is a relationship between Non-Financial Rewards and employee Turnover Intention.
- Hypothesis Two: There is a relationship between Non-Financial Rewards and Intrinsic Motivation.
- Hypothesis Three: There is a relationship between Intrinsic Motivation and employee Turnover Intention.
- Hypothesis Four: Non-Financial Rewards influence employee Turnover Intention through Intrinsic Motivation.

IV. DADA ANALYSIS AND INTERPRETATION

Descriptive statistical Analysis used in order to analyze the existing situation of the non-financial rewards, intrinsic motivation and turnover intention dimensions. Descriptive analysis provides a clear summary regarding the sample of the study. The majority of the executive level employees in this research sample were male employees (86%) and the age group 25 to 35 was the most frequent age category who is working in the five star category hotels in Sri Lanka (77.3%). Significant numbers of employees who are employed in this industry have 5-10 years of service experience and it is identified as 76.7% of the sample.

Mean value with non-financial rewards of employees was 3.74 and it implied that employees were moderately agreed with non-financial incentives. The standard deviation and coefficient of variance was 0.66 and 45.62% respectively. Furthermore, the mean value of the intrinsic motivation variable was 3.79 and therefore the employees were moderately agreed with intrinsic motivation. The standard deviation and coefficient of variance is 0.76 and 57.7% respectively. The mean value of the employee turnover intention was 1.73. It implied that employees were disagreed with turnover intention. The standard deviation and coefficient of variance is 0.79 and 70% respectively. When considering the overall mean values, it can be clearly recognized that there was not higher variation between those values.

Based on the analyzed data the correlation value between independent and dependent variable was negative 0.62 which implied that there was a strong negative relationship. Furthermore, p-value of the results was 0.02 which emphasizes that there was a significant

negative relationship between independent and dependent variables at 0.05 significant level. This illustrate when non-financial rewards increase, turnover intention would be decrease.

In order to identify the impact of the non- financial rewards on employee turnover intention simple regression analysis was conducted and the results are summarized as follows.

Table 1-Regression Output

Model	B	Standard error	t value	P value
Constant	3.166	0.392	9.266	0.000
Non- Financial Rewards	-0.569	0.167	-6.549	0.000

Dependent variable: Turnover Intention

Source: Based on analyzed data

Based on the analyzed data the constant value is +3.166. It implies that the value of turnover intention, when the non-financial reward is equals to the zero level. Moreover, the coefficient of non-financial incentives is -0.569. It is the average change in turnover intention due to the one unit change in non-financial rewards. It explained about that when non-financial rewards were increase by one unit, turnover intention decrease by the 0.586 times. In addition to that it's also implies that the negative relationship between non-financial incentives and turnover intention at 0.05 significance level ($p < 0.05$).

In accordance with the significance of the model the p value is 0.000, therefore, the regression model is significant at 0.05 significant level. When consider about the linear regression model summery the R2 value was 0.27. In accordance with that it can be concluded 27% of total variation of Employee Turnover Intention is explained by the Non- Financial Rewards. On the other hand, 73% of total variance in the dependent variable is unexplained by the linear regression model. Therefore, it appears that the model was fitted in unfair manner. Because of, the unexplained variation is higher than the explained variation.

Mediator analysis

In order to identify the mediating role of the Intrinsic Motivation with the relationship with independent and the dependent variable, Baron and Kenny mediator analysis was conducted. The result of the mediating analysis is summarized as follows;

Table 2- SPSS Output of mediator analysis

Path	B (unstandardized coefficient)	Standard error	B (standardized coefficient)	P value
C path	-0.569	0.054	0.565	0.000
A path	0.564	0.072	0.563	0.000
B path	-0.516	0.053	-0.513	0.000
C' path	-0.373	0.060	-0.365	0.000

Source; Based on analyzed data

The above table revealed that the all four paths are significant with the coefficients of 0.569,0.564,-0.516,-0.373 at the 0.05 significant levels. In accordance with the coefficient between Non- financial rewards and Employee Turnover Intention it can be clearly identified that there is a strong negative relationship between both variables. Because of it implied value as -0.569. In addition to that p value denotes 0.000. Therefore, it is significance at 0.05 level. Hence it can be concluded that there is a strong negative relationship between independent and dependent variable without having any mediator. Additionally, according to the Baron and Kenny mediation model c path is significant.

Moreover, the coefficient between Non-Financial Rewards and Intrinsic motivation was 0.564. It suggested that strong positive relationship between independent and the mediating variable. With reference to the Baron and Kenny a path also significant at 0.05 level because the p value is 0.000.

Similarly, the coefficient between intrinsic motivation and Employee Turnover Intention was negative 0.516. It illustrates that there is a strong negative relationship between the mediating variable and the dependent variable. With reference to the Baron and Kenny mediator Analysis, b path also significant at 0.05 level because the p value is 0.000.

As per the table, the data support for a statistically significant relationship ($P < 0.05$) between the variables when analyze the independent variable and Mediating variable in predicting dependent variable. It implied coefficient value as negative 0.373. Hence there is weak negative relationship between variables when mediator is in the model. Therefore, the c' path also significant and When compare the c path and c' path there is a significant difference between the coefficients of the two paths.

$$C \text{ path} - c' \text{ path} = -0.569 - (-0.373) = -0.196$$

Based on the above difference, when mediator is in the model, the effect of independent variable on dependent variable is reduced. Coefficient difference is negative 0.196 and it implied that intrinsic motivation partially mediates the relationship between Non-Financial Rewards and Employee Turnover Intention at 0.05 significant level.

Moreover, Sobel calculation illustrates the portion of Non-Financial Rewards on Employee Turnover Intention due to the mediating effect of Intrinsic Motivation and it is 41.33% at the 0.05 significant level. Thus, the Mediator analysis and Sobel test identified that intrinsic motivation partially mediates the relationship between the Non-Financial Rewards and Employee Turnover Intention.

V. CONCLUSION

Overall summary of the research study mentions about the most important idea about the influence of non-financial rewards on turnover intention for operational level employees in the hotel industry. Based on the results of the regression analysis there is a strong negative relationship between Non-Financial Rewards and Employee Turnover Intention. These findings are agreed with results of the study previous literature and Stark (2007) regards nonfinancial rewards as crucial in helping an organization stand out as a top employer, and also have the dual impact of increasing engagement among employees. Moreover, the study identified Intrinsic Motivation as a mediator in between Non-Financial Rewards and employee Turnover Intention. Intrinsic Motivation partially mediates the relationship between Non-Financial rewards and Turnover Intention of the employee. This research discovered that non-financial rewards for staff are the most significant driver of reducing the intention of operational level employee turnover in the hotel industry, it is stated that businesses should give high priority to improving their non-financial incentive package. Despite the fact that hotel industry employees work under tight schedules, additional non-financial incentives are not given. Thus, Organizational management can properly improve employee enrichment and it will help to improve the quality of work life for the worker. It can produce a better working atmosphere. In addition top management should allocate adequate funds to employ employees to carry out their jobs in effective manner as well as they can design appropriate rewarding system based on their performance. Finally, based on the findings of the study top management of the hotel industry in Sri Lanka can formulate effective strategies to identify the factors to reduce the turnover intention of their organizations.

Abstract- Antibiotic prescription after simple extraction of tooth has remained a controversial topic amongst dental fraternity owing to the fact that antibiotic resistance is becoming a serious public health and patient safety issue. A prospective clinical trial was undertaken to assess the rationale behind antibiotic use after simple extractions in minimizing post extraction pain and discomfort. *Materials and methods:* All the patients undergoing simple extractions were categorized into two groups: Group 1: patients receiving antibiotics postoperatively, Group 2: patients not receiving antibiotics postextraction. The patients were evaluated upto 6 postextraction days for signs of infection and dry socket. *Results:* 4 patients (1.2%) reported with infection of the extraction socket in nonantibiotic group, whereas 1 (0.3%) case of infection was found in the antibiotic group. Dry socket was seen in 29 (8.8%) patients, 16 (4.8%) in the antibiotic group and 13 (3.9%) in the nonantibiotic group. *Conclusion:* The results of the present study do not significantly justify the use of antibiotics following extractions.

Index Terms- antibiotic resistance, dry socket, infection.

Declarations of Interest: None.

I. INTRODUCTION

A major turning point in medicine, as well as in human history was the discovery of antibiotics in the early 20th century. Unfortunately, development of resistance turned out to be a serious consequence of the use of these lifesaving and wondrous medicines. Bacterial resistance to antibiotics is multifactorial. In medicine, long-term and repetitive use of broad-spectrum antibiotics has resulted in antibiotic resistance. Some resistance occurs intrinsically, but much of the blame is attributable to decades of use by medical practitioners, nontherapeutic use in agriculture, and careless disposal of waste by the pharmaceutical industry as a whole ¹.

Antibiotics used in dentistry are frequently broad-spectrum agents, which can predispose for the selection of resistant strains. Furthermore, there is evidence that antibiotic-resistant bacteria, such as the *Prevotella* species, are being isolated from odontogenic infections with increasing frequency². Antibiotic

resistance is a serious public health and patient safety issue. Antibiotic resistant infections are extremely difficult to treat and frequently recur¹. The indiscriminate use of antibiotics may promote the emergence of antibiotic resistant bacterial strains, increases the likelihood of preventable adverse reactions, and represents a waste of healthcare resources². This problem has proved to be unrelenting and a constant source of frustration for researchers, health care providers as well as patients¹.

Of the total antibacterial prescriptions, dental prescriptions contribute upto 7–9% in primary care ^{1,3}. This doubly emphasizes the responsibility of dental surgeons on curbing the practice of routine antibiotic prophylaxis and practicing selective antibiotic use. Varied schools of thought exist among dental academia regarding prescription of antibiotics after simple tooth extraction. Although bacteremia occurs during simple exodontia^{1,4}, this does not justify antibiotic use in a healthy individual, as the effective host response can sufficiently counteract it. The current trend in dentistry in the developed world is shifting to the notion that antibiotics are not justified following simple exodontia. Unfortunately not much focus is laid on this aspect in the developing world where standards of oral care are far below those in the developed world^{1,5}.

The aim of the present study is to determine the rationality for postoperative antibiotic use following simple exodontia and assessing its efficacy in minimizing postoperative patient discomfort and complications

II. MATERIALS AND METHODS

A prospective randomized double-blind placebo-controlled clinical trial study was designed wherein all healthy males and females who reported to the Department of Oral and Maxillofacial Surgery, Government Dental College and Hospital, Hyderabad, India and undergoing simple tooth extractions from January 2019 till March 2019 were included in the study.

Inclusion criteria were as follows: (1) both male and female patients; (2) patients aged between 15 and 80 years; (3) patients with a good systemic health; (4) patients undergoing simple extractions of permanent mandibular and/or maxillary teeth ; (6) patients undergoing single tooth extractions; (7) extractions requiring minimal instrumentation.

Exclusion criteria were as follows: (1) patients undergoing surgical extractions; (2) patients with deciduous teeth or teeth associated with local pathology; (3) patients with impacted mandibular third molars; (4) patients with a debilitating systemic disease; (5) patients undergoing extractions of endodontically treated teeth; (6) patients currently taking antibiotics at the time of extraction or have had antibiotics less than 3 days prior to extraction; (7) patients with habits which are known to be detrimental to oral health such as smoking, pan, betel nut, and/or tobacco chewing; (8) patients presenting with acute infections; (9) pregnant patients (10) inability to appear for follow-up.

All patients who fulfilled the inclusion criteria, after approval by the Institutional Ethical Review Committee were included in this study. All extractions were performed in the oral surgery department at Government Dental College and hospital, Hyderabad by senior dental surgeons (residents) under strict aseptic conditions using the following surgical protocol: regular surgical gloves and masks were worn for every extraction; 2% lignocaine containing 1 : 80,000 adrenaline were administered using 25/27 gauge needle prior to extraction; inferior alveolar nerve block was used for mandibular molars and premolars and local infiltration was used for mandibular anterior teeth and all maxillary teeth.

All the patients undergoing simple extractions were randomly categorized into two groups:

Group 1: patients receiving postextraction antibiotics.

Group 2: patients not receiving postextraction antibiotics.

Group 1: Patients Receiving Postextraction Antibiotics. All patients in this group were prescribed amoxicillin 500mg 8 hourly for 5 days along with Diclofenac sodium 75mg 8 hourly for 3 days starting 30 minutes after the extraction.

Group 2: Patients Not Receiving Postextraction Antibiotics. All patients in this group were not prescribed antibiotic and were given Diclofenac sodium 75mg 8 hourly for 3 days starting 30 minutes after the extraction.

Randomization was achieved using the closed envelope technique. In this randomization technique, dental surgeons were given randomly generated prescription regimen within sealed opaque envelopes. After establishing consent, the envelope was opened and the patient was then offered the allocated prescription regimen.

Extractions were performed with minimal invasion using a mucoperiosteal elevator, straight elevator (if required), and

forceps. After achieving hemostasis using a cotton pressure pack, postoperative instructions were given to every patient. Patients were recalled after five days to assess postoperative complications including inflammation, wound infection, and dry socket. Intensity of pain (Fig. 1) was evaluated in preoperative and postoperative session using Visual Analogue Scale (VAS) of 10 cm horizontal line where the end points were marked as no pain and unbearable pain. Patients were asked to indicate on the line at a point which corresponds to the level of pain intensity he/she feels.

On recall, patients were evaluated for signs of persistent inflammation (i.e., degree of pain, swelling, and redness) and signs of dry socket (i.e., severe pain accompanied with presence of denuded bone at the base of the socket). Presence of persistent inflammation and/or suppuration on the 6th day was considered as wound infection.

Photographs were also taken preoperatively and during each follow-up session to document the outcome.

The data were entered into the computer for analysis with the help of software program SPSS version 16 for windows. The data were expressed as number, percentage and mean + SD over the table. The evaluation was done by unpaired 't' test and Chi square (χ^2) test. The result was considered significant if p value was <0.05. Tables were used to show the results and bar diagram were performed as necessary

Data Analysis. Data was analyzed using SPSS version 21. Chi square test was used to test the p value.

Null Hypothesis. Antibiotics do not significantly reduce postoperative complications in young healthy patients following simple tooth extraction.

III. RESULTS

Out of the initial sample of 400 (200 in each group), 328 patients turned up for follow-up visit, out of which 141 (42.9%) were males and 187 (57.1%) were females. Antibiotic group comprised 152 patients (70 males and 82 females) and nonantibiotic group included 176 patients (79 males and 97 females). (Figure 1). Out of the total sample, 179 were maxillary teeth and 149 mandibular teeth (Table 1).

The mean age of the patients was 34.35 years \pm 9.16. The most common reason for extraction was grossly carious teeth 32%, followed by periodontitis 27.7% and root pieces 11.5% (Figure 2,3).

Figure 1. Gender distribution (diagram)

Table 1. Extracted teeth

Tooth extracted	11	12	13	14	15	16	17	18	21	22	23	24	25	26	27	28
Gp I	1	0	1	4	3	14	6	4	0	0	2	2	3	17	8	9
Gp II	1	1	1	4	4	26	9	8	0	2	2	3	9	15	11	9

Tooth extracted	31	32	33	34	35	36	37	38	41	42	43	44	45	46	47	48
Gp I	0	0	2	2	9	10	8	10	1	2	1	5	7	10	7	4
Gp II	1	2	2	3	8	9	8	5	0	2	1	2	3	16	6	3

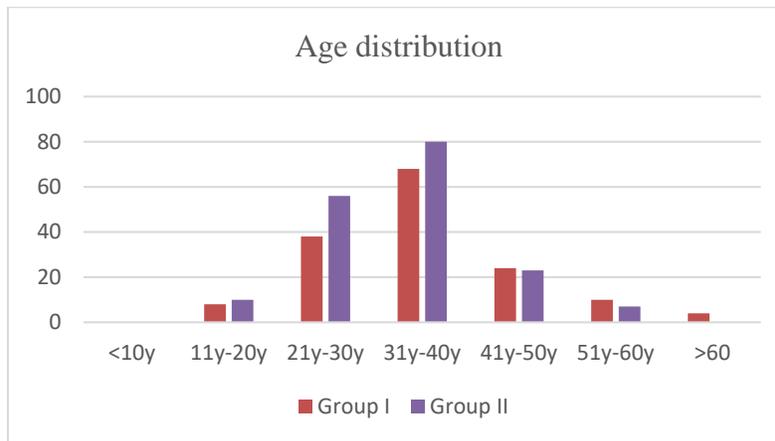

Figure 2. Age distribution(diagram)

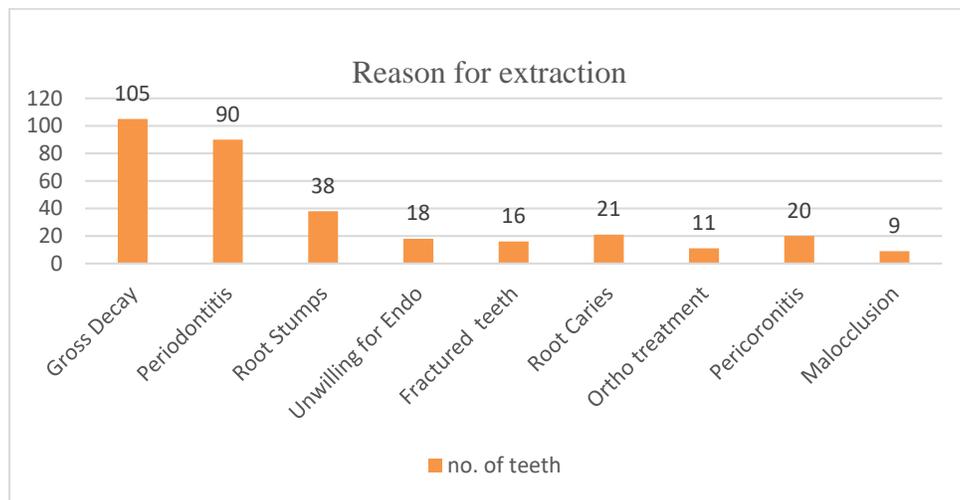

Figure 3. Reason for Extraction

The mean time taken for extraction was 8.52 minutes \pm 3.46. Out of the total sample, 294 (89.6%) presented with no postoperative complications and 34 (10.4%) had postoperative complications, which included dry socket (alveolar osteitis) in 29 (8.8%) patients, 16 (4.8%) in the antibiotic group and 13 (3.9%) in the nonantibiotic group. 4 patients (1.2%) reported with infection of the extraction socket in nonantibiotic group, whereas 1 (0.3%) case of infection was found in the antibiotic group. Out of the 29 cases of dry socket, interestingly, 18 (62%) cases belonged to females, whereas 11(38%) was found in males. Although there was no relationship between antibiotic use and dry socket (Table 2), the overall female predisposition was also found statistically insignificant ($p = 0.43$). Of the patients presenting with dry socket, 24 patients had preoperative pain (12.5% of total cases with preoperative pain). Out of the 29 patients who presented with postoperative dry socket, 24 (82.7%) were patients with dry socket

who reported preoperative pain (12.5% of all cases with preoperative pain). Five cases of dry socket occurred in patients who reported no preoperative pain (4.5% of all cases who presented without any preoperative pain). However, this relationship was found to be statistically insignificant ($p = 0.06$) (Table 3).

Of the total sample, 23 (7%) patients showed adverse effect to the drugs prescribed. Diarrhea was reported in 7 (2.1%) patients, abdominal discomfort in 11 (3.3%) patients, and vomiting in 5 (1.5%) patients. About 86% (20) of patients who presented with adverse effects belonged to the antibiotic group. Only 3 patients from the nonantibiotic group reported adverse effects (2 vomiting and 1 abdominal discomfort) (Table 4). The relationship between adverse effects and antibiotics was proved to be statistically significant ($p = 0.0001$).

Table 2. Distribution of dry socket amongst male and females in both the groups

Gender	Group	Dry socket	X^2	p value
Male	Group I	6 (8.6%)	0.23	0.62
	Group II	5 (6.3%)		
Female	Group I	10 (12.2%)	0.62	0.42
	Group II	8 (8.2%)		

Table 3. Association of preop. pain with dry socket

Preop pain	Dry socket yes	Dry socket No	X^2	p value
Yes(216)	24 (11.1%)	192	3.45	0.06
No (112)	5 (4.46%)	107		

Table 4. Drug Adverse effects

Adverse effects	Group I	Group II	X ² 0.605 p value = 0.0001
None	132	173	
Diarrhoea	7	-	
Abdominal discomfort	10	1	
Vomitting	3	2	

Pain scale indicated gradual increase in pain in the first 24 hours and a gradual decline over the next 5 days.

The overall trend showed the decrease in preoperative pain after the first hour followed by a slight increase after 6 hours and then a gradual decline over the next 5 days. This trend was equally represented in both groups although to varying degrees. (Table 5). The mean pain score between assessment stages (6 hrs, 12 hrs, 24 hrs, 48 hrs, and 72 hrs) shows a greater drop in the antibiotic group over 72 hours (p = 0.9 NS). Out of the total sample, 328 (152 in

the antibiotic and 176 in the nonantibiotic group) patients presented with a complaint of preoperative pain ranging from very mild to very severe pain. Out of 328 patients, 29 (12 in the antibiotic and 17 in the nonantibiotic group) patients reported postoperative pain ranging from very mild to very severe even after 6 days. The average preoperative pain was 1.82 ± 1.73 in the antibiotic group and 2.07 ± 1.68 in the nonantibiotic group. Only 4 patients reported swelling after 6 days of extraction (2 each in both the groups).

Table 5. Mean distribution of pre-op and post-op. pain

Study group	Assessment stages	Mean	S.D	n
Group I (with antibiotics)	Preop	1.82	1.73	152
	6 hrs	1.56	0.83	152
	12 hrs	2.03	0.81	152
	24 hrs	1.25	0.78	152
	48hrs	1.21	1.8	152
	72 hrs	0.66	1.24	152
Group II (without antibiotics)	Preop	2.07	1.68	176
	6 hrs	1.42	0.52	176
	12 hrs	1.69	0.79	176
	24 hrs	1.31	0.88	176
	48 hrs	1.14	1.46	176
	72 hrs	0.76	1.22	176

IV. DISCUSSION

The results of the present study indicate no significant role of antibiotics in simple extractions in terms of improving postoperative quality of life. The ideal agent to be used after tooth extraction should alleviate pain, reduce swelling and trismus to a minimum, promote healing and have no unwanted effects. Since such an agent does not exist, analgesics are the obvious choice for relief of pain, an analgesic with additional anti-inflammatory properties should be used wherever indicated⁶.

The prophylactic use of antibiotics refers to the administration of these agents preoperatively to prevent a postoperative infection. Unless a significant risk of postoperative

infection is present, generally, antibiotics should not be required before the removal of erupted carious or periodontally involved teeth. Although extraction sockets are considered contaminated wounds, the organisms involved are part of the normal oral flora, and therefore are not a usual source of postextraction infection. However, the decision of prophylactic antibiotics prescription in noninfected cases should also be based on whether patients have any significant medical risk factors that could adversely affect their humoral and cellular defense mechanisms, and whether any systemic risks are associated with the bacteremia that accompanies tooth extraction⁷.

The data and literature to support prophylactic administration of oral antibiotics are inconsistent and have

demonstrated that neither preoperative nor postoperative prophylactic administration of antibiotics have shown any statistically significant benefit with regard to surgical site infection or alveolar osteitis over patients who did not receive antibiotic prophylaxis¹. Pain experienced from pulpitis, periodontitis, alveolar osteitis, or peri-implantitis is not an indication for antibiotics. The antibiotics may serve to decrease local inflammation caused by surface biofilm bacteria and, therefore, reduce the patient's symptoms. These patients require mechanical or surgical intervention in the form of caries control, extractions, root canal therapy, scaling, and root planing, for example, rather than systemic antibiotics. However, patients presenting with cellulitis or abscess involving fascial planes may benefit from systemic antibiotics, where they serve as an adjunctive measure to surgical or mechanical removal of the infective source to prevent the hematogenous or local spread of the infective bacteria¹.

The results of the present study do not significantly justify the use of antibiotics following extractions. This was proved by the fact that there were only 5 cases (1.5%) of infection amongst the entire sample. These findings are similar to numerous other studies such as those by Agrawal et al⁶, Yousuf et al⁸ and van Eeden and B'utow⁹. Conversely, a study done by Arteagoitia et al¹⁰ reported a significant rise in the rate of infection related complications in individuals who were not prescribed antibiotics (up to 12.9%).

However, the aforementioned study was performed exclusively on impacted molars and therefore may have limited bearing on the present study. There were some postoperative complications in the present study too. A few patients presented with dry socket and postoperative pain even upon evaluation on the 6th day (see Table 5). The number of diagnosed dry socket cases was nearly similarly distributed in both groups. Dry socket is a phenomenon which relates to lack of clot retention/formation within the socket and is not considered an infectious process. These findings correlate with other studies conducted by Arteagoitia et al¹⁰ and L'opez-Cedr'un et al¹¹ which noted no difference in prevalence of dry socket when postoperative antibiotics were given. However, it should be noted that in a study conducted by van Eeden and B'utow⁹, there were no cases of dry socket in individuals who were given antibiotics, whereas 15.8% of those who were not given antibiotics presented with dry socket.

Although all drugs are known to have adverse effects, unsurprisingly, patients belonging to antibiotics group reported more adverse effects when compared with their counterparts in the nonantibiotic group (see Table 4). Diarrhea, abdominal pain, and vomiting were the predominant gastrointestinal tract related effects. Although these cases presented in only a small minority of patients who consumed antibiotics, they still question the rationale behind antibiotic use unnecessarily without producing any tangible benefits. In fact this increases the physical as well as financial burden on the patient. This is especially a problem in developing countries where financial constraints make it difficult for patients to afford an antibiotic regimen in addition to treatment. Adverse effects of antibiotics can result in reduced quality of life and can significantly disrupt their daily work and probable source of livelihood. On a community level the antibiotic overuse has many consequences such as promoting the development of resistant organisms and unfavorable drug interactions⁸. Dental surgeons must take it as an ethical responsibility and play a pivotal

role in preventing the propagation of such microbes by limiting the use of antibiotics and being selective in their prescription.

The antibiotic group showed a better pain profile than the nonantibiotic group, showing a steeper decline in pain over 72 hrs. (see Table 4). However, it should be noted that reduction in pain profile was not statistically significant ($p = 0.99$) in the present study and therefore does not justify the use of antibiotics. Studies conducted by van Eeden and B'utow⁹ and Agrawal et al¹⁰, also reported no significant relationship between the use of antibiotics and postoperative pain. As studies have proved that this is unacceptable and a disservice to not only the patient but also the community at large, the practice of prescribing antibiotics routinely as a preventive measure to avoid postoperative complications, like pain and infection, must be discarded. The use of a stronger analgesic instead is a much better option after simple extractions to reduce pain in lieu of antibiotics⁸.

V. CONCLUSION

Although circumstances exist when systemic antibiotics are indicated, proactive local measures are usually sufficient in treating bacterial infections of the oral cavity before antibiotics are truly indicated. Strict adherence to universal precautions and sterilization protocols wherever applicable may help prevent disease transmission as well. As dentists, we can do little to limit the use of antibiotics in other arenas like agriculture or regulate dumping of antibiotic manufacturing by-products into the environment. But we can strive to practice responsible, evidence-based medicine and dentistry. Prudent use of antibiotics plays an important role in minimising the impact of antimicrobial resistance on public health.

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

Abstract- This research aimed to find out the effect of logistics outcome quality and logistics process quality to customer satisfaction in Palembang post office. The dimensions used for the logistics process quality variable are (procedure, contact quality personnel, information quality, and order discrepancy handling) while the dimensions used for logistics outcome quality variables are product availability, accuracy & condition order, and timeliness. The sample in this study is 100 respondents with the sampling technique using the census method. The data analysis used in this study is multiple linear regression analysis using the SPSS 15.0 program. The results of this study indicate that logistics outcome quality and logistics process quality have a positive and significant influence to customer satisfaction.

Index Terms- Customer Satisfaction, Logistics Outcome Quality, Logistics Process Quality, Post Office.

I. INTRODUCTION

The Indonesian Logistics Association (ALI) in 2018 estimates the growth of the logistics market in Indonesia in 2019 to be in the range of 10-12 percent, as well as from Data Fost & Sullivan in 2018 estimated that the Indonesian logistics industry will grow 15.4 percent with a value of Rp. 4396 trillion in 2020. This significant growth is driven by consumption of the population, improvement in infrastructure and foreign investment.

Consumer satisfaction is a basic concept in marketing and business strategies [9]. Consumer satisfaction consists of feelings of pleasure or disappointment resulting from comparisons between buyer expectations and perceptions of performance (or results) of a product [28]. Consumer satisfaction arises when companies manage to provide logistics services that meet or exceed consumer expectations [40]. Quality of logistics services (Logistics Services Quality) can affect customer satisfaction [33].

Logistics Service Quality has two concepts, Logistics Outcome Quality (LOQ), which refers to the determination of the extent to which the promised core benefits or results are

delivered, and Logistics Process Quality (LPQ) that addresses the service delivery process [33]. the separation of dimensions of LOQ and LPQ service quality in a comprehensive model is an important step in our understanding of how Consumer Perceptions of quality services are formed. The dimensions of Logistics Process Quality (LPQ) are Ordering Procedures, Contact Quality Personnel, Information Quality, and Order Discrepancy Handling. The dimensions of Logistics Outcome Quality (LOQ) are Product Availability, Accuracy, Condition Order, and Timeliness.

Research Problem

- Does Logistics Process Quality and Logistics Outcome Quality effect Customer Satisfaction In Palembang Post Office? admissions in reputed varsity. Now, here we enlist the proven steps to publish the research paper in a journal.

II. LITERATURE REVIEW

A. Consumer Satisfaction

Consumer satisfaction is an emotional response to experience related to the product or service purchased. As for the factors that influence consumer perceptions and expectations, among others, needs and desires related to the things that consumers feel when trying to make transactions with product manufacturers, and past experience when consuming products from companies and competitors, and experience from friends [47].

B. Logistics Service Quality

Research by Millen et al. (1999) identified a significant increase in customer satisfaction as a key benefit of Logistics Service Quality (LSQ). Logistics Service Quality is a scale used to measure logistics service quality [47]. Logistics Service Quality has two concepts, Logistics Outcome Quality (LOQ), which refers to the determination of the extent to which the promised core benefits or results are delivered and the Logistics Process Quality (LPQ) that addresses the service delivery process. The separation of dimensions of LOQ and LPQ service quality in a comprehensive model is an important step in our

understanding of how consumer perceptions of quality services are formed. The dimensions of Logistics Process Quality (LPQ) are Ordering Procedures, Contact Quality Personnel, Information Quality, and Order Discrepancy Handling. The dimensions of Logistics Outcome Quality (LOQ) are Product Availability, Order Accuracy, Timeliness, and Order Condition.

C. Logistics Process Quality

The dimensions of Logistics Process Quality (LPQ) are four sub-dimensions, namely Ordering Procedure, Contact Quality Personnel, Information Quality, and Order Discrepancy Handling [5]. Ordering procedures discuss the efficiency and effectiveness of the procedures made by the company. It is important for companies to make order placement procedures to be effective and easy to use by consumers [43]. Personnel Contact Quality, refers to the consumer orientation of contact people from the company's logistics department. Specifically, consumers see about whether customer service staff are knowledgeable, empathize with the consumer situation, and help consumers solve their problems [43]. Information Quality, The ability of courier providers to enter relevant product and service information. It is important to attract consumers to pay attention to the special services and promotions provided to meet their needs [43]. Order Discrepancy Handling, refers to how well the company handles mismatches in orders that occur after orders arrive at consumers [43].

D. Logistics Outcome Quality

The dimensions of Logistics Outcome Quality (LOQ) are Product Availability, Order Accuracy, and Timeliness [5]. Product Availability, Refers to customer ability to choose products that are with the conditions of the package [39]. Order Accuracy, refers to the truth of service information and the accuracy of delivery to consumers [46]. Timeliness, refers to arrived time package to receiver location by the promised time. Timeliness also refers to the time needed between order placement and acceptance by consumers [43]. Order Condition, refers to damage condition that can occur while deliver to receiver. If the goods are damaged, consumers cannot use them and must wait for compensation from the company or they could use other service [43].

III. RESEARCH FRAMEWORK

Based on the above explanation, the theoretical framework is as follows:

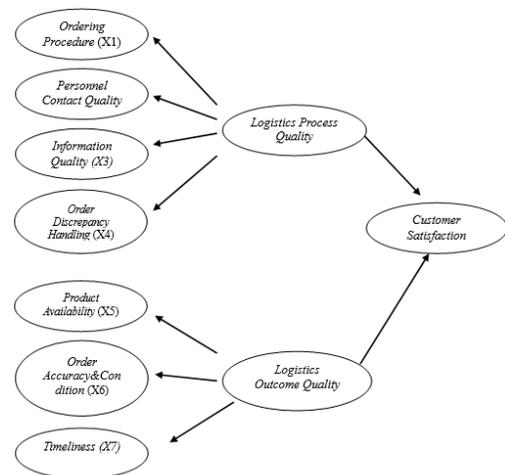

Fig-1: Path Diagram Model of This Research Framework

IV. METHODOLOGY

This study intends to measure the relationship between research variables. This study is useful for modeling and measuring the relationships between research variables or useful for analyzing and seeing the effect of independent variables (X) on the dependent variable (Y).

The design of this study is as follows:

1. Variable X (Free Variable), namely Logistics Process Quality and Logistics Outcome Quality
2. Variable Y (Bound Variables), namely Customer Satisfaction

In this study, respondents in this study were all customers Palembang post office 30000 with 100 samples customers. the research use Multiple Linear Regression as a research hypothesis testing technique to look for the model regression. On this research, the calculations were assisted by SPSS for Windows Version 15 software [8].

V. RESULT AND DISCUSSION

A. Validity Test Results

Instrumnt (Questionnaire Question) are called valid if there is significant correlation with the total score. In this research validity is tested using the Pearson Correlation method. The value of r table by significance level 0.01, two-way test, by N = 30 is 0.30. If the value of $r \geq 0.30$ then the statement items in questionnaire are valid. If the value of $r \leq 0.30$ then the statement items in questionnaire are invalid. The test results show that all indicators used to measure the variables in this research have r value greater than the r table value. This means all indicators are valid as research instruments.

B. Reliability Test Result

The Cronbach Alpha method is used to test the reliability of the instrument. Instruments are considered to have a high level of reliability if the value obtained is ≥ 0.60 . The table below is the result of reliability testing:

Table-1: Reliability Test Result

No.	Variabel	Cronbach Alpha	Parameter	Result
1	Logistics Process Quality (X ₁)	0,899	0,6	Reliable
2	Logistics Outcome Quality (X ₂)	0,847	0,6	Reliable
3	Customer Satisfaction (Y)	0,911	0,6	Reliable

Source: SPSS version 15 output processed, 2019

Table-1 above shows the Cronbach Alpha values for each statement is greater than 0.6, which means each indicator variable is reliable.

Demographic Variables

Through table-2, the number of respondents who filled out the questionnaire in this research were 100 consumer, consist of 65 male customer (65%), and 35 female customer (35%).

Table-2: Identity Distribution of Respondents

No.	Karakteristik	Jumlah	Persentase
A. Gender			
	1. Laki-laki	65	65,00%
	2. Perempuan	35	35,00%
B. Customers Age			
	1. 17 – 20 Years	6	6,00%
	2. 21 – 30 Years	24	24,00%
	3. 31 – 40 Years	33	33,00%
	4. 41 – 50 Years	27	27,00%
	5. ≥ 51 Years	10	10,00%
C. Last Education			
	1.Elementary School	9	9,00%
	2.Junior High School	25	25,00%
	3.Senior High School	32	32,00%
	4.Diploma	20	20,00%
	5.Bachelor	14	14,00%
D. Customer Jobs			
	1. Student / College Student	11	11,00%
	2. Government employees	24	24,00%
	3. Private Employees	31	31,00%
	4. Entrepreneur	24	24,00%
	5. House wife	10	10,00%
E. Products Used			
	1. Pos Internasional	26	26,00%
	2. Pos Express	25	25,00%
	3. Paket Kilat Khusus	35	35,00%
	4. Paket Pos Biasa	14	14,00%

F.	Logistics Service / month		
	1. 2 times	30	30,00%
	2. 3 times	51	51,00%
	3. > 3 times	19	19,00%

Source: SPSS version 15 output processed, 2019

Based on age, the customers is dominated by customer aged 31-40 years with 33 people (33%). Based on education level, respondents is dominated high schooler graduated with 32 people (32%), followed by junior high schooler graduated with 25 people (25%). Then, the previous work was dominated by private companies with 31 people (31%). Logistics Product dominated by Paket Kilat Khusus product with 35 people (35%) the highest than other product. Based on how often customers use post office service per month, 51 people (51%) used this service 3 times per month.

C. Multiple Regressions Analysis

Before the test was carried out, the researchers conducted normality, multicollinearity, and heteroscedasticity tests to ensure that the regression equation had accuracy in estimation, unbiased and consistent. The test results show that the regression model was feasible because it met the assumptions of normality, there was no multicollinearity, and there was no problem of heteroscedasticity in the regression model. Following tables are the results of multiple regression analysis by SPSS version 15 for Windows:

The Proposed Hypothesis

1. Logistics Process Quality (LPQ) has a significant positive effect on Customer Satisfaction at the Palembang Post Office.
2. Logistics Outcome Quality (LOQ) has a significant positive effect on Customer Satisfaction at the Palembang Post Office.
3. Logistics Process Quality (LPQ) and Logistics Outcome Quality (LOQ) simultaneously have a significant positive effect on Customer Satisfaction at the Palembang Post Office.

Table-3: The Results of Multiple Linear Regression Analysis

Variabel	(B)	Std Error	Beta	Sig.
Constant	8,617	5,793		0,140
Logistics Process Quality	0,123	0,047	0,196	0,011
Logistics Outcome Quality	0,518	0,055	0,703	0,000

Source: SPSS version 15 output processed, 2019

Based on the data analysis, the regression equation is obtained:

$$Y = 8,617 + 0,123 (X_1) + 0,518 (X_2)$$

The above equation can be explained by below:

1. Logistics Process Quality variables have a positive effect on the Consumer Satisfaction variable.
2. Logistics Outcome Quality variable has a positive effect on the Consumer Satisfaction variable.

Table-3 also contains the value of t which can be a reference to whether the . Logistics Process Quality and . Logistics Outcome effect the Consumer Satisfaction.

D. Determination Test (R²)

Determination test in multiple linear regression is used to determine the percentage contribution of the influence of independent variables simultaneously on the dependent variable. This coefficient shows how much the percentage variation of the independent variables used in the model is able to explain the variation of the dependent variable. Based on the results of calculations with SPSS for Windows version 15.00, the results of the determination test are obtained as follows:

Table-4: The Results of Determination Test (R²)

Model	r	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	0,689 ^a	0,475	0,464	2,9171	2,473

Source: SPSS version 15 output processed, 2019

Based on Table-4 above, the coefficient of determination has a value of 0.475 (47.5%). This can state that the Logistics Process Quality and Logistics Outcome variables can explain the Consumer Satisfaction variable by 47.5%, while the remaining 52.5% is influenced by other independent variables other than the variables in this study.

E. Model Test (F Test)

The results of this test are to find out whether the regression model can be used to predict the dependent variable or not, in addition to knowing whether the independent variables together have a significant effect on the dependent variable. Significant means that the relationship that occurs can apply to the population (can be generalized).

Table-5: The Results of F Test

Model	Sum of Squares	df	Mean Square	F	Sig.
1 Regression	747,232	2	373,616	43,906	0,000 ^a
Residual	825,424	97	8,510		
Total	1572,656	99			

Source: SPSS version 15 output processed, 2019

Regression Parameter Coefficient Test

This test is to test whether the parameters (regression coefficients and constants) to estimate the equation / multiple

linear regression models are already the right parameters or not. The right intention here is that these parameters are able to explain free behavior in influencing the dependent variable. In this section, the t test is focused on the regression coefficient. The t test is known as a partial test, which is to test how the influence of each independent variable individually on the dependent variable. This test can be done by comparing t count with t table or by looking at the column of significance in each t count

This study was conducted with a significance of 0.05 ($\alpha = 5\%$) as shown in Table-6 below.

Table-6: The Results of tTest

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	8, 617	5,793		1,488	0,140
	Logistics Process Quality	0,123	0,047	0,196	2,603	0,011
	Logistics Outcome Quality	0,518	0,055	0,703	9,346	0,000

Source: SPSS version 15 output processed, 2019

t count is greater than the error level of 0.05, it can be said that the independent variable does not have a significant effect on the dependent variable. Based on the data in table 4.17 above, it can be explained as follows:

1. Variable Logistics Process Quality have a positive and significant effect on the Customer Satisfaction variable at PT. Pos Indonesia (Persero) Palembang Post Office 30000.
2. Variable Logistics Outcome Quality has a positive and significant effect on the Customer Satisfaction variable at PT. Pos Indonesia (Persero) Palembang Post Office 30000.

VI. CONCLUSION AND RECOMMENDATION

Conclusion

Based on the research problem formulation proposed, then referring to the data analysis model that has been done, and various discussions that have been put forward in the previous chapter, we can draw some conclusion as follow:

1. Descriptively it is found that the indicator of shipping costs when the order process gets the value of satisfaction under other indicators.
2. Logistics Process Quality has a positive and significant effect on Consumer Satisfaction at PT. Pos Indonesia (Persero) Palembang Post office 30000.
3. Logistics Outcome Quality has a positive and significant effect on Customer Satisfaction PT. Pos Indonesia (Persero) Palembang Post office 30000.
4. Logistics Process Quality and Logistics Outcome Quality simultaneously have a positive and significant effect on Customer Satisfaction PT. Pos Indonesia (Persero) Palembang Post office 30000.

Recommendation

Based on the results of research, discussion and conclusions, the suggestions that can be given are as follows.

PT. Pos Indonesia (Persero) Palembang Post Office 30000

Logistics Process Quality and Logistics Outcome Quality is a quality that must always be applied and maintained in Companies. On the point of question the cost of order indicator gets quite good respond. Therefore, PT. Pos Indonesia (persero) Palembang Post Office 30000 is recommended to provide competitive prices with competitors by recalculating the prevailing prices with the highest frequency of delivery to the destination, so that for this purpose prices can be lowered by comparing freight rates compared to per kilogram.

Further research

For the next researcher, it is expected to add other research variables and indicators, so that they can answer in more detail in explaining the research on customer satisfaction.

Abstract- Queues (waiting lines) are a part of everyday life. However, having to wait is not just a petty personal annoyance. A queuing model is constructed so that queue lengths and waiting time can be predicted. Queuing models represent the queuing systems. This model enables the performance measures and customers' patience in the restaurant. The common problem arises in almost every famous restaurant is that they lose the customers because of a long waiting line and poor quality service. This paper analyze the performance measures and the customers' patience in the system. The data sets are obtained from a Kentucky Fried Chicken shop in Yangon in order to derive the arrival rate, the service rate, utilization factor, waiting time and probability of potential balking customers. The collected data is analyzed by Little's formula and queuing model which is M/M/1 model.

Index Terms- Kendall's Notation, Little's Formula, Queuing Models, Queuing Theory

I. INTRODUCTION

To improve the customers' return, the managers in the restaurant must consider a long waiting line and poor quality services. Although the taste, cleanliness, the restaurant layout and view are the most important factors for the restaurant, other factors such as customers' patience, long waiting line must be considered by managers. These factors will reduce customers' demands and even profit. In mathematics, a random service theory is called the queuing theory to solve the problems and analyze the system. By using queuing theory, the average waiting time in queue, average waiting time in the system, the average queue length, the average number of customers in queue and average number of customers in the system, the busy period and idle time can be calculated. To model the restaurant operation, queuing theory have been previously used by many researchers. This study is to measure the performance in the system and analyze the customers' patience on the administrative issues.

II. METHODOLOGY

A. The Conceptual Framework: Queuing Theory

In queuing theory, a discipline within the mathematical theory of probability, an M/M/1 queue represents the queue length in a system having a single server, whose arrivals are determined by a Poisson process and job service times have an exponential distribution. The model name is written in Kendall's notation. An M/M/1 queue is a stochastic process whose state

space is the set $\{0, 1, 2, \dots, n\}$ where the values corresponds to the number of customers in the system, including any currently in service.[1] To make the business decisions providing a service, queuing theory is considered. Queuing theory is based on probability theory and random process. From the fundamental features of the queuing theory, the customer's arrival pattern, the service time of server may be one of the probability distributions. The M/M/1 system is made of a Poisson arrival, one exponential (Poisson) servers, FIFO (or not specified) queue of unlimited capacity and unlimited customer population. The M/M/1 model show clearly the basic ideas and methods of Queuing Theory.[2]

B. Basic Structure of Queuing Models

The basic process assumed by most queuing models is the following: Customers requiring service are generated over time by an input source. At certain times, a member of the queue is selected for service by some rule known as the queue discipline. The required service is then performed for the customer by service mechanism. This process is depicted in Figure 1.[3]

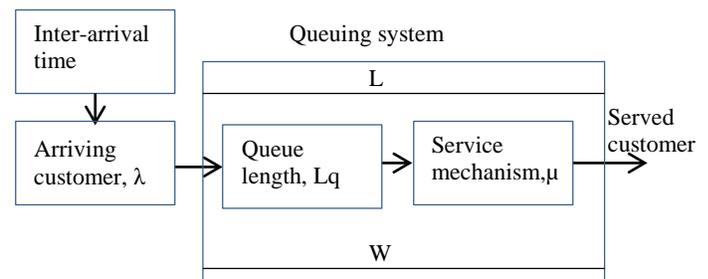

Figure 1. M/M/1 Queuing model

The input source is the total number of customers that might require service from time to time, i.e., the total number of distinct potential customers. The input source is said to be either unlimited or limited.

The queue is where customers wait before being served. The queue length is the maximum permissible number of customers that it can contain.

The queue discipline indicates the manner in which the units are taken for service. The usual queue discipline is first come first served, or FCFS through sometimes there are other service discipline, such as last come, first served or service in random order.[4]

The service mechanism consists of one or more service facilities, each of which contains one or more parallel service channels, called servers.

The time elapsed from the commencement of service to its completion for a customer at a service facility is the service time.

A model of a particular queuing system must specify the probability distribution of service times for each server. The service time distribution that is most frequently assumed in practice is the exponential distribution.

C. The Role of the Exponential Distribution

The operating characteristics of queuing systems are determined largely by two statistical properties, namely, the probability distribution of inter-arrival times and the probability distribution of service times. For real queuing systems, these distributions can take on almost any form. The most important probability distribution in queuing theory is the exponential distribution. The cumulative probabilities are

$$P\{T < t\} = 1 - e^{-\alpha t} \quad (1)$$

$$P\{T > t\} = e^{-\alpha t} \quad (2)$$

D. Little's Law

Little's law is a theorem that determines the average number of customers in a business system based on the average waiting time of a customer within a system and the average number of customers arriving at the system per unit time. [5] Mathematically, Little's law is expressed through the following equation:

$$L = \lambda W \quad (3)$$

Although it looks intuitively easy, it is quite a remarkable result as the relationship is not influenced by the arrival process distribution, the service distribution, the service order or practically anything else.

E. Queuing Models and Kendall's Notation

In queuing models, the following factors are characterized:[3]

Arrival time distribution: Inter -arrival times independently and identically distributed according to an exponential distributions (i.e. the input process is Poisson)

Service time distribution: The service time distribution can be exponential distribution. The service time is independent of the inter-arrival time.

Service mechanism: It consists of one or more service facilities, each of which contains one or more parallel service channels, called servers.

Queue lengths: There may be infinite or finite queue length .

Queuing discipline: The queue discipline refers to the order in which members of the queue are selected for service. It may be first-come-first-served, random, according to some priority procedure, or some other order. First-come-first-served usually is assumed by queuing models.

Capacity: The maximum number of customers in a system can be several.

Kendall's notation is a system of notation according to which the various characteristics of a queuing model are identified. Kendall (Kendall, 1951) has introduced a set of notations which have

become standard in the literature of queuing models. A general queuing system is denoted by (a/b/c):(d/e) [6] where
a= probability distribution of the inter-arrival time
b=probability distribution of the service time
c=number of servers in the system
d=maximum number of customers allowed in the system
e=queue discipline

III. PROCEDURAL OVERVIEW

From observation, this shop has several waiters but only one chef can serve all of the customers.

A. Procedure with Data

In M/M/1 queuing model, the following formulas will be used[3].

$$\rho = \frac{\lambda}{\mu} \quad (4)$$

$$P_0 = 1 - \rho \quad (5)$$

$$P_n = (1 - \rho)\rho^n \quad (6)$$

$$L = \frac{\lambda}{\mu - \lambda} \quad (7)$$

$$L_q = \frac{\rho^2}{1 - \rho} \quad (8)$$

$$W = \frac{1}{\mu - \lambda} \quad (9)$$

$$W_q = \frac{L_q}{\lambda} \quad (10)$$

λ = expected number of arrivals per unit time

μ =expected number of customers completing service per unit time

ρ =utilization factor

P_0 = probability of no customer in the system

P_n = probability of exactly n customers in queuing system

L = average number of customers in the system

L_q = average number of customers in queue

W = average waiting time spent in the system

W_q =average waiting time in queue

B. Calculation

From observations, the KFC shop provides 25 tables and 98 chairs in shop 1 and 17 tables and 72 chairs in shop 2. If necessary, the extra chairs are provided. There are several waiters to serve. In this shop, between 400 and 600 customers can be served during weekdays and between 500 and 1000 customers can be served during weekends in shop 1 and between 300 and 500 during weekdays and between 500 and 700 during weekends in shop 2. This paper seeks to analyze the performance

measures and customers' patience during weekdays and weekends respectively. The time window is 3 hours.

In shop 1, at the off-peak hours, there are an average 500 people coming to this shop in 3 hours. From this, the arrival rate can be derived as: $\lambda = \frac{500}{180} = 2.78$ customers per minute. From observations, each customer spends 30 minutes an average in it (W), the waiting time (W_q) is about 3 minutes in peak hours.

Next, the average customers in this shop is $L = \lambda W = 2.78 \times 30 = 83.34$ customers. It is Little's formula. There is no customer in queue because the system capacity is greater than the average number of customers. There is also no waiting time in queue in off-peak hours. The service rate can be derived as:

$$\mu = \frac{\lambda(1 + L)}{L} = \frac{2.78(1 + 83.34)}{83.34} = 2.81 \text{ customers per minute}$$

It means that nearly 3 customers can be served in one minute. The utilization factor or busy period can be calculated as:

$$\rho = \frac{2.78}{2.81} = 0.989$$

It means that the chef is very busy. And the probability that the system is idle can be calculated:

$$P_0 = 1 - 0.989 = 0.01$$

It means that the system may be free in 1%. The probability of exactly 'n' customer in the system:

$$P_n = (1 - \rho)\rho^n$$

In off-peak hours, there is no customer in queue to be served. So, there is no customer to balk in this situation.

In peak-hours, the measures of performance can be calculated as follows: there are on average 750 people coming to this shop in 3 hours. From this, the arrival rate is 4.167 customers per minute. As above, $W=30$ minutes and $W_q=3$ minutes, so, $L=125$ customers. In this situation, the capacity is just 98 but the number of customer is 125 people. So, the number of customer is greater than the capacity. So, there is also need to know the average number of customers in queue. $L_q= 12.5$ customers are in queue. The service rate for this situation is: $\mu=4.2$ customers per minute.

It means that 4.2 customers can be served in one minute. The utilization factor is 0.992 and the idle time is 0.008.

In peak-hours, potential customers will start to balk because of a long waiting line. When the customers see more than 10 people are already in queue and a potential can tolerate is 15 people, the probability of customers going away is:

$$P_{125-140} = \sum_{n=125}^{140} (0.008) (0.992)^n = 4.156 \%$$

In shop 2, at the off-peak hours, there are an average 400 people coming to this shop in 3 hours. From this, the arrival rate can be derived as: $\lambda = 2.22$ customers per minute. From observations, each customer spends 30 minutes an average in it (W), the waiting time (W_q) is about 3 minutes in peak hours.

Next, the average number of customers in this shop is 67 customers. There is no customer in queue because the capacity of this shop is greater than the average number of customers in it. There is also no waiting time in queue in off-peak hours. The service rate is 2.25 customers per minute. It means that nearly 3 customers can be served in one minute. The utilization factor or busy period is 0.987. And the probability that the system idle is 0.013. It means that the system may be free in 1.3%.

In peak-hours, the measures of performance can be calculated as follows: there are on average 600 people coming to this shop in 3 hours. From this, the arrival rate is 3.33 customers per minute. As above, $W=30$ minutes and $W_q=3$ minutes, so, there are 100 customers in the system. In this situation, the capacity is just 72 but the number of customer is 100 people. So, the number of customer is greater than the capacity. The average number of customers in queue is $L_q= 10$ customers is in queue. The service rate for this situation is 3.36 customers per minute. The utilization factor is 0.99 and the idle time is 0.01.

In peak-hours, the potential customers who will start to balk because of a long waiting line. When they see more than 10 people are already in queue and a potential can tolerate is 15 people, the probability of customers going away is:

$$P_{100-125} = \sum_{n=100}^{125} (0.01) (0.99)^n = 8.42 \%$$

IV. RESULTS

The utilization rate is very high at 0.989 and 0.987 at weekdays and 0.992 and 0.99 at weekends. But the service rate is at 2.81 and 2.25 customers per minute on weekdays and at 4.2 and 3.36 customers per minute on weekends each shop. But the quality of service is needed to consider. Because the more the customer, the less the service of quality. It is main point. The faster the service, the poorer the taste. But, when the service rate is higher, the utilization rate will be lower. It can decrease the probability of the customers going away.

This paper can help to increase the quality of service by anticipating if there are many customers in the queue. By analyzing the huge number of customers coming and going in a day, the manager can determine how to decide to get profit. The summarized result is shown in Table 1 and Table 2 respectively.

Table 1. The Summarized Results in Shop 1

V. CONCLUSIONS

The overall analysis of the results can be summarized as follows: On weekdays, there are nearly 83 customers and 67 customers in this system but no customer in queue. Nearly 3 customers and 2 customers can be served in one minute each shop. So, the server is very busy in this situation. On weekends, there are 125 customers and 100 customers each shop and nearly 13 customers and 10 customers in queue to be served in peak hours. 4 customers can be served in one minute at shop 1 and 3 customers can be served in one minute at shop 2. The service rates are greater than before. So, the quality of service may be poor. The chef is very busy too. In shop 1, 4% of customers will start to balk and nearly 8% of the customers will balk at shop 2. And the fact that the potential customers who will start to balk must be considered. This theory can also be applied for the restaurant if they want to calculate all the data daily. By analyzing the several number of customers in the system to serve and the busy period, this shop can set a target how to manage.

ACKNOWLEDGEMENT

Abstract- Learning is a process to create a state of conducive and able to make individuals feel comfortable in learning situations. In order to have a good interaction in the teaching-learning process only acts as a facilitator and learners are required to be active in digging his knowledge. In the learning process, a lot of learning models and techniques that can improve creativity and learning activities of learners so as to achieve the objective of learning which one of them is the cooperative learning model of STAD type and mind map techniques.

This research aims to determine the influence of: (1) The influence of the model of cooperative learning of the type of a-kind technique of mind map on student learning activities in class IV Elementary School Penambangan Sidoarjo and (2) influence of study model cooperative type STAD assisted technique mind map towards student learning outcomes in class IV elementary School Penambangan Sidoarjo.

This research is an experimental study with one group pretest-posttest control group design. Data collection techniques are done through observation, documentation, and test results. Data analysis techniques to know the influence of the cooperative model of cooperatives type STAD assisted technique mind Map carried out using the test T-Test with the help of software SPSS 25 for Windows.

Data analysis results show significant differences between activity and study results before and after treatment. Both on activity and learning outcomes, the Posttest value gained higher than the pretest value. The T-test result results in a T-table > T-count value, with the significance of the 0.05 known Sig. 2 tailed value of $0,000 < 0.05$ so it is declared H_0 is rejected. This means there is a significant difference in experimental learning outcomes with the control class at the time of Posttest.

Based on the results of data analysis can be concluded that: (1) There are influences of the model of cooperative learning of type STAD with technical mind map techniques to study activity in class IV and (2) there is the influence of model cooperative learning type the STAD is assisted with mind map techniques towards student learning outcomes in class IV.

Index Terms- STAD Learning Model, Mind Map, Activity, Learning Outcomes

I. INTRODUCTION

Elementary school is the initial foundation of moral and character formation for learners. Teachers play a very important role. Teachers are tasked to print a qualified generation of the nation through effective learning. The teacher serves as a facilitator directing and guiding learners to develop their own knowledge. In learning, learners must be able to experience a change of mindset that initially did not know to know and understand. To embed knowledge to learners, learning and teaching excitement should be systematic, balanced, interconnected, and influence each other.

If the teacher is active and dominates the learning activities, the learners will not be able to develop their talents and abilities. According to Ahmad (2010:03), students will understand the knowledge when hearing directly and prove the truth. So, learning by doing and learning by experience. They will be easier to understand the knowledge gained by their own evidence than simply listening to the teacher who is speaking and telling the knowledge.

The implementation of the 2013 curriculum aims to remove the separation boundaries between subjects because it is considered to limit the scope of learners' knowledge. As such, teachers must follow the age of the ages by giving students the ability to face the 21st century including critical, creative, innovative, communicative and collaborative thinking. The task and role of the teacher should be in accordance with the father of national education KI Hajar Dewantara, the teacher in front as exemplary, in the middle of giving an idea, and behind to give encouragement to the participants. To achieve effective learning outcomes, students' ability should be used as a goal in designing learning activities. In delivering the material, the teacher must adapt to the students' condition. Includes a selection of appropriate models and learning techniques.

In this case, researchers offer a learning solution that is with the model of cooperative learning of type STAD with technique

mind map techniques in the learning process. With the help of the STAD-type cooperative learning model, learners will experience learning by being directly involved by emphasizing the activity and interaction between learners in the group. Thus, it will create an active learning atmosphere and not just one direction. Using the STAD-type cooperative learning model, learning will be more meaningful because of mutual cooperation in completing tasks. This is in accordance with the concepts of the Zone of Proximal Development and Scaffolding on constructivism learning theories where students are able to accomplish assignments with the help of teachers and their peers who are more of the matter through cooperation in Study Group. With the concept of Zone of Proximal Development and Scaffolding, it will increase the knowledge of learners to be more structured and fuller.

This type of cooperative learning Model is assisted by mind map techniques so that learning becomes more interesting and can help make it easier for students to understand and remember the material. According to Suryosubroto (2009:21), learning techniques are part of a learning method. The technique is used to implement learning methods that will be implemented by observing the students' conditions and the learning environment. Every teacher surely has different teaching techniques. In this case, researchers use mind maps to facilitate students' understanding. According to Beaulieu (2008:17), the image always has more power than a word. So, learners will more easily absorb knowledge delivered through images than words.

After observations on the average of middle semester scoring and daily assessment of class IV of the Elementary School of Sidoarjo, the students' study results of 35% are still under the Minimum eligibility Criteria (KKM) set at The 2018/2019 school year of 78. On the beautiful theme of diversity in my country requires learning models and techniques that can facilitate the delivery of the material to the learners. The basic competency of social sciences on the material relates to the economic activities that exist in the community. Researchers choose the model of cooperative learning STAD type with technique mind map because it is considered able to facilitate the delivery of materials

to students. Through the cooperative learning model of STAD type, students will discuss and instruct his knowledge with his group friends on the economic activities that exist around his residence and pour his idea in the form of a mind map. In the implementation of the STAD type Cooperative learning model, learners are grouped heterogeneously with differing academic abilities, gender, tribe, and performance levels.

Hopefully, when teachers apply to learn Model STAD assisted Technique Mind Map then the activity and student learning outcomes will increase. As such, researchers will conduct research titled **“The Influence Of Cooperative Learning Model Stad Type-Assisted Technique Mind Map On Activity And Outcomes Of Learning Students Grade IV Elementary School Penambangan Sidoarjo”**.

II. METHOD

The type of research used in this research is quantitative research. The type of quantitative research used is experimental research. The purpose of this research is to know the effect of a treatment on something controlled. In this study, researchers used Pre-Experimental design with the form of One group Pretest-Posttest Design. In this case, the treatment is a learning model of STAD assisted technique mind map. In this study are all students of class IV School of Penambangan Sidoarjo which amounted to as much as 48 learners. Sampling is done by purposive sampling technique. The time used for this study was in the even semester of the 2018-2019 school year.

III. RESULTS AND DISCUSSION

RESULTS

Research results related to the activity and outcomes of students' learning before and after the treatment model of learning STAD with the technique of mind map techniques. Can be seen in the table below:

Average student learning activities

Value	Student Learning Activities	
	Before Treatment	After Treatment
Average	64, 7	80,9
Highest value	83, 3	91, 6
Lowest value	50, 0	75, 0

Average learners Pretest and Posttest

Nilai	Student Learning Outcomes	
	Pretest	Posttest
Average	62,60	80,41
Highest value	80	90
Lowest value	25	65

From data on the average value of activity and student learning outcomes, there can be a significant improvement. In the hypothesis testing, researchers conducted the t-test test with the results in the table below.

Paired Samples Test Learning activities

Paired Differences	t	df	Sig. (2-tailed)

IV. DISCUSSION

Research results related to students' learning activities, indicating a significant difference in activity value. Before the treatment obtained the value of learning activities by 64,7 and the value of learning activities after giving a treatment of 80.9. Starting from the data that has been obtained, the researcher processed the data using SPSS for Windows and resulted in a signification (2-tailed) value of 0.000. So the significance value is smaller than 0.05. Thus, the learning model of the STAD-assisted technique mind map affects the learning activities of students in elementary School of Penambangan Sidoarjo.

Researchers using the learning model of STAD assisted technique mind map. During the learning process, active learners begin to look. All passive becomes active when discussing. The influence of these students' activity also occurred in the study conducted by Ernawita (2018) which was an increase of 12.65% and after the data was processed, the hypothesis test showed that the signification (2-tailed) level of < 0.05. The STAD learning model affects the activities of the students. In his research revealed, that the increase in the value of student learning activities is influenced by the exactness of the learning model, in this case, the student learning activities on the basic social sciences are influenced by the model Type Cooperative learning. Through this STAD model, they have the opportunity to become a peer tutor who will make them more active in learning.

The measurement of learners' learning results is done by giving study results test of pretests and Posttest. Before being taught with the STAD type Cooperative learning model, the results of the study were very much below average and after treatment, the learners' learning results increased. In the results of early observation, results can be obtained average pretests value of 62.60. After the treatment was given the average posttest value of the learners increased to 80.41. Starting from the data that has been obtained, the researcher processed the data using SPSS for Windows and resulted in a signification (2-tailed) value of 0.000. So the significance value is smaller than 0.05. Thus, the learning model of the STAD-assisted technique mind Map has an effect on

the outcomes of students' learning in elementary School of Penambangan Sidoarjo.

V. CONCLUSION

Based on the results of the research and data processing can be concluded that the model of cooperative learning STAD type with mind map technique affects the activity and learning outcomes of learners in grade IV Elementary School. It can be seen from the difference of results t-test pretest and Posttest both activity and learning outcomes of learners. For the calculation of learners' learning activities through observation obtained a significance value of 0.000. As for the calculation of student learning results through pretests and posttest administration and obtained significance value of 0.000.

Data analysis results show significant differences between activity and study results before and after treatment. Both on activity and learning outcomes, the Posttest value gained higher than the pretest value. The T-test result results in a T-table > T-count value, with the signification of the 0.05 known Sig. 2 tailed value of 0,000 < 0.05 so it is declared Ho is rejected. This means there is a significant difference in experimental learning outcomes with the control class at the time of Posttest. Based on the results of data analysis can be concluded that: (1) There are influences of the model of cooperative learning of type STAD with technical mind map techniques to study activity in class IV and (2) there is the influence of model cooperative learning type the STAD is assisted with mind map techniques towards student learning outcomes in class IV. So, it can be concluded that the learning Model of STAD with a technique mind map affect the activity and learning outcomes of students in class IV elementary School Penambangan Sidoarjo.

Abstract- *Hadang Game or Gobak Sodor* is a regional game from Indonesia that played by children. This game is a team game consist of two teams, each team consists of 5-7 people. The core of the game is to block your opponent from being able to get past the line specified in the rules of the game. To win, players must collect points by passing guards from the front row to the back row, and vice versa. This study aims to determine the results of the development of plyometric exercise method (Scissor Jump, Stride Jump Crossover, Lateral Bound) and for playing games. Plyometric is an exercise method that focuses on movement at high speed. The method used in this study is research-based development (R & D), aimed at developing plyometric exercise products. The research sample is the fifth grade students of SD Negeri 98 North Bengkulu amounting to 28 people. In the preliminary observation, the researchers have obtained pre-test data and the results of interviews from both teachers and students. Based on the results of the study using the plyometric method shows that the basic physical condition of the fifth grade students of SD Negeri 98 North Bengkulu in the good category. This is evidenced by the results of cognitive and psychomotor tests that have been conducted on small group trials with the acquisition of a percentage of 20% (2 people) with very good categories, 50% (5 people) with good categories, 10% (1 person) with enough categories and 20% (2 people) with less categories. Whereas in large group trials there was a percentage of 21% (6 people) with a very good category, 43% (12 people) with a good category, 25% (7 people) with enough categories, and 11% (3 people) with less category. Thus, it can be concluded that the plyometric method is feasible to be used for is the fifth grade students of SD Negeri 98 North Bengkulu. Suggestions for the teachers, that the use of the plyometric method is an alternative in the learning process, especially *Hadang* traditional game.

Index Terms- Hadang Traditional Game, Plyometric Method.

I. INTRODUCTION

The game is one form physical education activity in elementary school. Playing is an individual's need and there is a natural instinct from birth. Children will play with pleasure and burden. Natural instincts must be nurtured and channeled to positive and well-controlled things.

Traditional games are a means to introduce children to cultural values and social norms needed to establish relationships or social contacts and play a role in accordance with social positions in the community. Traditional games not only provide

recreational value or just have fun. More than that, traditional games also have the value of physical education (sports) and even social values. That is because in traditional games there are elements such as sportmanship, honesty, precision, agility, accuracy in determining steps, and working together in groups.

Hadang Game or Gobak Sodor is a kind of regional game from Indonesia that we can still find today played by children of elementary school. This game is a group game consisting of two groups, where each team consists of 5-7 people. The point of the game is to block the opponent from being able to get past the line to the last row back and forth, and to win the game, all group members must complete the process back and forth in the specified area.

Each region has a game that is almost the same implementation or much in common with games in other regions. The game names are the same or sometimes it is different from the other regions. For example, it can be stated in Central Java known as *the Gobak Sodor game*, in Jakarta it is called *Galasin*, while in North Sumatra it is called *Margalah*, but the game has the same rules. In order not to be confused, the Sports Director named the game as *Hadang* Game, it based on the observation that the task of the game is to block.

Based on observation and interview with physical education teachers at SD Negeri 98 North Bengkulu. In learning, physical education teachers only provide material in accordance with the existing curriculum without adjusting the existing environmental conditions at school. The teacher has never given a game to play through plyometric exercise, there is an opportunity to develop a face learning model because it has a field and physical education tools available at school.

The researchers wanted to develop traditional games through plyometric exercises so that students were more enthusiastic in physical education. Plyometric exercises show the characteristics of full strength of muscle contraction with very fast response, dynamic loading or very complicated muscle stretching (Radcliffe and Farentinos, 1985: 111). According to Chu (2000: 6) plyometric has the advantage, using force and speed achieved by accelerating body weight against gravity, this causes the force of velocity in practice.

The development of *Hadang* traditional game through plyometric exercise can be used in outdoor and indoor fields. The dominant physical elements that emerge in the game include reaction speed, sprint speed, and agility. In addition to these physical elements, there are also other elements, namely cooperative elements which include teamwork. The development

of game play in physical education through plyometric exercise is carried out with the aim of preparing students to move actively in learning. The learning model used is motion learning in the game of running techniques, deception and concentration. The learning method used is the PAIKEM approach-*Pembelajaran yang Aktif, Inovatif, Kreatif dan Menyenangkan* which is active, innovative, creative, and fun learning. Based on the description, the researchers are interested in conducting a research entitled: "Development of *Hadang* Traditional Game Through Plyometric Exercise Method".

II. LITERATURE REVIEW

Traditional games are physical activities that are carried out consciously and intentionally and use rules on the basis of habits that are inherited from one generation to another, Sumardiyanto (2010: 3). Traditional games are games played by children of ancient times. Most of these games are done in groups. The lives of people in the past who do not know the outside world have directed and guided them to high social and togetherness activities.

Moreover, Indonesian culture in general highly upholds the values of togetherness. This then led to the creation of traditional types of games. Unfortunately the development of the era, especially the rapid development of technology has made this type of game disappear slowly.

Traditional games are a form of game activity that develops from a particular community habit. In subsequent developments traditional games are often used as a type of game that has original regional characteristics and is adapted to local cultural traditions. In the implementation of traditional games can include elements of folk games and children's games into it. It is even possible to include activities that contain elements of art such as what is commonly referred to as traditional art (Agustin, 2013).

Traditional games here can be synonymous with traditional sports terms. In order for an activity to be categorized as a traditional game of course the elements of tradition must be identified which have a close connection with the habits or customs of a particular community group. In addition, the activity must also contain strong physical elements that obviously involve large muscle groups and also contain elements of spirit which underlie the intent and purpose of the activity. That is, an activity is said to be a traditional game if the activity is still recognized as having certain traditions. Involving large muscles and the presence of strategies and their fundamentals do not really look like what they display (Agustin, 2013).

Plyometric comes from the word "plyethyein" (Greek) which means to improve, or it can also be interpreted from the words "plio" and "metric" which means more and measure, respectively which means stretching (Radcliffe and Farentinos, 1985: 3). Plyometric is a method for developing explosive power, which is an important component in achieving plyometric exercise which results in isometric muscle movement and causes reflex strain in the muscles. Plyometric exercises are carried out a series of power exercises specifically designed to help muscles reach their maximum potential level in the shortest possible time.

Plyometric is the right practice for people who are conditioned and devoted to becoming athletes in increasing and developing maximum jump, speed, and strength. Chu (1992)

explained that plyometric is a training method that emphasizes movements at high speed, plyometric training to apply speed to strength.

III. METHODOLOGY

Research Methods

Research-based development is a type of research that use in solving practical problems, especially education and learning research. According to Borg & Gall as quoted by Wasis D (2004: 4) research and development is a process used to develop or validate the products used in learning education. Furthermore, it is stated that the research and development procedures basically consist of two main objectives, namely: (1) developing the product, and (2) testing the effectiveness of the product in achieving its objectives.

Samples are partially or representative of the population studied, Arikunto (2002: 109). According to Sugiyono (2007: 56) the sample is a portion of the number and characteristics possessed by the population. The sample in this study was the fifth grade students of SD Negeri 98 North Bengkulu, amounting to 28 people. The sampling technique is to include all individuals or members of the population into a sample. The sampling technique in this study is total sampling.

Based on the results of needs analysis, the next step is the development of *Hadang* game exercise model modified in the form of developing a plyometric exercise model (Drill Scissor Jump, Stride Jumps, Lateral Bound Drill). In developing the exercise model developed, the researcher made an exercise model based on the study which was then evaluated by a physical education teacher as a learning expert.

The design of the research by using the Plyometric Exercise Model (Drill Scissor Jump, Stride Jumps, Lateral Bound Drill) with the form of the development of game play to train physical conditions tailored to the needs of students in learning to solve so that learning can run more effective and efficient. This development of exercise model is designed s in learning variation and can optimize the movement of students by utilizing existing facilities and infrastructure. The learning in the form of this game is competitive to increase enthusiasm, fair play attitude and high fighting ability.

IV. RESULTS AND DISCUSSION

The Results Data of Small Scale Trials

After the drafting of the initial product, the traditional game development model was completed, the product was tested on the fifth grade students of SD Negeri 98 North Bengkulu 98 using a total sampling method.

This small-scale trial aims to find out and identify various problems such as weaknesses, shortcomings, or effectiveness of products when used by students. Data obtained from this trial was used as a basis for revising the product before being used in large scale trials.

Based on the results data of the questionnaire filled out by the students obtained the percentage of answers that correspond to the aspects assessed at 80%. Based on the criteria that have been determined, the traditional game development model with the

plyometric method has met the criteria very well, therefore it can be used for fifth grade students of SD Negeri 98 North Bengkulu.

The Data Analysis Results of Small Scale Trials

In the analysis of data from the results of small-scale trials carried out obtained through cognitive and psychomotor test results that have been done with the acquisition of a percentage of 20% (2 people) with a very good category, 50% (5 people) with good categories, 10% (1 people) with enough categories, and a percentage of 20% (2 people) with less categories. Based on the predetermined criteria, the development products of *Hadang* traditional game using Plyometric have fulfilled the **Good** criteria, therefore it can be used for the fifth grade students of SD Negeri 98 North Bengkulu. The factor that makes this model acceptable to fifth grade students of SD Negeri 98 North Bengkulu is the assessment of the quality of *Hadang* traditional game models with plyometric methods performed on psychomotor and cognitive aspects that have met the criteria of **Very Good**.

The Results Data of Large Scale Trials

Based on expert evaluation and small-scale trials the next step is a large-scale trial. Large-scale trials aim to determine the effectiveness of changes that have been made to evaluate cognitive and psychomotor tests and small-scale trials whether the development model of *Hadang* traditional game using a plyometric method can be used. Large-scale trial data was collected using questionnaires.

Based on large-scale trials, data obtained from students who have understood and are able to practice traditional sports correctly in a percentage of 89%. Based on the predetermined criteria, the development model of traditional game using the plyometric method meets the criteria very well, so that it can be used for fifth grade students of SD Negeri 98 North Bengkulu. The following data shows the percentage of student questionnaires. In a large group trial a percentage of 21% (6 people) with a very good category is obtained, 43% (12 people) with good categories, 25% (7 people) with sufficient categories, and a percentage of 11% (3 people) with less categories.

The Data Analysis Results of Large Scale Trials

The Data Analysis Results of Large Scale Trials obtained a percentage of answer choices that were 90% suitable. Based on criteria that had been determined, the development model of traditional game using the plyometric method had met the criteria **very well**, therefore from large-scale trials this model could be used for fifth grade students of SD Negeri 98 North Bengkulu. The factor that makes this model acceptable that is all aspects

tested, 90% of students can exercise well. Both from understanding the rules of the game, the application of attitudes in traditional game activities has to be carried out using a plyometric method that is in accordance with the level of growth and development.

V. CONCLUSIONS

The development model products of *Hadang* traditional game using the plyometric method can be practiced by the test subjects. It was based on the results of the analysis of cognitive tests and psychomotor tests of the results of small-scale trials of 80% and large-scale trials of 90% and meeting the criteria very well.

If there are no problems, the development of *Hadang* game using the plyometric method can be continued, but if there is a problem, the game development model can be adjusted and then a work evaluation can be done to obtain the conformity of the development model of *Hadang* traditional game to the conditions and situations in the field.

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9243>

Abstract: In this paper, the energy levels for $^{46-45}\text{Ca}$, $^{46-45}\text{Ti}$ and $^{46-45}\text{Sc}$ isotopes have been calculated. Calculations were carried out in the f7-shell region by employing the effective interactions, f748pn and using the shell model code OXBASH for windows by applying spin-parity of valance nucleons. It is found that there is good convergence of energy levels values with the standard practical value.

Key words: Energy levels, OXBASH Code and gamma transitions.

1. Introduction

The aim of this paper is study of the energy levels of $^{46-45}\text{Ca}$, $^{46-45}\text{Ti}$ and $^{46-45}\text{Sc}$ isotopes by using OXBASH code for windows. This program is a set of codes carrying out shell-model calculations with dimensions up to about 50,000 in the J-T scheme and about 2,000,000 in the M-scheme. Oxbash comes with a library of model spaces and interactions [1, 2].

Applied the shell model and use a Modified Brown and Sherr (f748pn) interaction for neutron and proton orbits in $^{46-45}\text{Ca}$, $^{46-45}\text{Ti}$ and $^{46-45}\text{Sc}$ to calculate the energy levels values. Various observables can be predicted accurately and systematically in terms of the nuclear shell model. For light nuclei, there are several "standard" effective interactions such as the Cohen-Kurath [3] and the USD [4] interactions for the *p* and *sd* shells, respectively. On the other hand, in the next major shell, *i.e.*, in the f7-shell, there are also "standard" interaction such as f748pn [5]. The spectroscopy of nuclei, in the f7-shell region, has been well described within the shell model framework. The best example for using several model spaces and two-body interactions is that of Brown et al, which is the most remarkable work in this field [6,7]. The starting point in all such shell-model calculations is the derivation of an effective interaction owing to the fact that the f7-shell is the most important for a variety of problems in nuclear structure such as electron capture in supernova explosions. In this work, the shell model calculations are carried out in the f7-shell region for the isotopes $^{46-45}\text{Ca}$, $^{46-45}\text{Ti}$ and $^{46-45}\text{Sc}$, to test the ability of the present effective interactions in reproducing the experiment in this mass region.

2. Shell Model Calculations

The calculations have been carried out in the nuclear shell model f7 using the code OXBASH for windows [6]. The code uses an m-scheme Slater determinant basis. With a projection technique, there are been constructed wave functions with good angular momentum J and isospin T. The f7pn model space is comprised of (1f7/2) below the closed N = Z=20 shell [8]. One can find the calculated results of states of the odd A and even A nuclei, number of protons, *i.e.*, 20 to the $^{46-45}\text{Ca}$, with neutron numbers (25, 26), number of protons, 21 to the $^{46-45}\text{Sc}$, with neutron numbers (24, 25) and number of protons, 22 to the $^{46-45}\text{Ti}$, with neutron numbers (23, 24) energy levels value.

2.1. Energy Levels Calculations

The calculations have been carried out using the code OXBASH for windows [9]. In the f7 model space comprised of the 0f7/2 valence orbits outside the ⁴⁰Ca. Two effective interactions have been employed with f7 model space for the calculations of level spectra, these effective interaction is f748pn [5]. It is worth mentioning that ⁴⁵Ca and ⁴⁶Ca have Isospin part (*T* = 2.5 and 3) respectively, ⁴⁵Sc and ⁴⁶Sc have Isospin part (*T* = 1.5 and 2) respectively, while ⁴⁵Ti and ⁴⁶Ti have Isospin part (*T* = 0.5 and 1) respectively.

The energy levels values for ⁴⁵Ca nucleus, the energy levels values are shown in table 1. these values are agreement with the experimental values, and new energy levels have been reached.

Table 1 shows a comparison of the energy levels values with respect to the ground state were calculated from f748pn effective interactions with experimental excitation energies of ⁴⁵Ca

Exp .Res[10]		F748pn	<i>J^π</i>
<i>J^π</i>	Energy elevels		
7/2 ⁻	0.000	0.000	7/2 ₁ ⁻
5/2 ⁻	0.174	0.151	5/2 ₁ ⁻
3/2 ⁻	1.434	1.221	3/2 ₁ ⁻
-----	1.584	1.616	11/2 ₁ ⁻
-----	1.94	1.927	9/2 ₁ ⁻
-----	2.953	2.936	15/2 ₁ ⁻

The energy levels values for ⁴⁶Ca nucleus from f748pn effective interaction is shown in table 2 and these effective interactions give good results in comparison with the experimental values.

Table 2 shows a comparison of the energy levels values with respect to the ground state were calculated from f748pn effective interactions with experimental excitation energies of ⁴⁶Ca

Exp .Res[11]		F748pn	<i>J^π</i>
<i>J^π</i>	Energy elevels		
0 ⁺	0.000	0.000	0 ₁ ⁺
2 ⁺	1.346	1.346	2 ₁ ⁺
4 ⁺	2.574	2.575	4 ₁ ⁺
6 ⁺	2.973	2.974	6 ₁ ⁺

The energy levels values for ⁴⁵Sc nucleus from f748pn effective interaction is shown in table 3 and these effective interaction results reasonably consistent with experimental data. The total angular momentum and parity are (7/2₁⁻, 11/2₁⁻, 9/2₁⁻, 15/2₁⁻, 7/2₃⁺, 5/2₂⁻, 9/2₃⁻, 19/2₁⁻, 23/2₁⁻, 7/2₇⁻) respectively, confirmation of which is (7/2⁻, 15/2⁻, 21/2⁻, 5/2⁻) as well as confirmation of momentum only, which is (1/2, 3/2, 9/2, 5/2, 3/2) respectively, and new energy levels have been reached.

Table 3 shows a comparison of the energy levels values with respect to the ground state were calculated from f748pn effective interactions with experimental excitation energies of ⁴⁵Sc

Exp .Res[10]		F748pn	<i>J^π</i>
<i>J^π</i>	Energy elevels

For ⁴⁶Sc nucleus the energy levels calculations from f748pn effective interaction is shown in table 4. The effective interactions give results reasonably consistent with experimental data. The total angular momentum and parity are (3₁⁺, 5₁⁺, 2₁⁺, 5₂⁺, 4₁⁺, 7₁⁺, 3₄⁺, 1₂⁺, 4₄⁺, 0₁⁺) respectively, confirmation of which is (2⁺, 4⁺) respectively, as well as confirmation of momentum only is (3, 3) respectively, and new energy levels have been reached.

Table 4 shows a comparison of the energy levels values with respect to the ground state were calculated from f748pn effective interactions with experimental excitation energies of ⁴⁶Sc

The energy levels values for ⁴⁵Ti nucleus from f748pn effective interaction is shown in table 5 and these effective interaction results reasonably consistent with experimental data. The total angular momentum and parity are (9/2₁⁻, 11/2₁⁻, 7/2₂⁻, 15/2₁⁻, 17/2₁⁺, 5/2₂⁻, 23/2₁⁻, 27/2₁⁻) respectively, confirmation of which is (3/2⁻) as well as confirmation of momentum only, which is (3/2, 11/2, 13/2, 7/2, 17/2) respectively, and new energy levels have been reached.

Table 5 shows a comparison of the energy levels values with respect to the ground state were calculated from f748pn effective interactions with experimental excitation energies of ⁴⁵Ti

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9244>

Abstract- The purpose of this research was to seek for classroom management strategies that a higher education professor uses in the context of a course of Literature taught to 2nd year undergraduate students from CVPU- Cape Verde Public University (Pseudonym) located in Cape Verde and to explore the role of the professor in using classroom management strategies to establish or maintain favorable conditions for learning and what classroom management practices do teachers implement in order to avoid behavioral problems. This research focused on qualitative data collection and the instrument that was used to collect the data of this study was semi structured interviews. The participant of this study was a professor from CVPU- Cape Verde Public University (Pseudonym) located in Cape Verde. The findings indicate that communication seems to be a fundamental component in classroom management, and it seems to be associated with the teacher's concept of how students learn and their intentions for teaching. In addition, it also suggests that learning is a gradual process, as students approach the fundamental concepts in period of studies, solve problems by relating these concepts in the group discussions and, finally, synthesize and register their understandings in the quiz.

Index Terms- Behavioral Problems, Classroom Management, Classroom Strategies, Higher Education, Teaching and Learning Process

I. INTRODUCTION

Assuming that the act of teaching should be understood in a contextualized way, in time and in space, it is understood that the privileged space for this is the classroom and the time available is that of the class. It is there and at that moment that teachers and students establish certain particular social relations that may favor or disempower the process of teaching and learning. Assuming that the primary purpose of the school is the transmission of historically constructed knowledge to the new generations to understand how, in fact, teachers manage the most diverse situations in search of effective professional duty that is essential to improve the quality of education. Doyle (1986) defines two main teacher tasks associated with classroom

management: class management (group organization, definition of rules, disciplinary procedures and sanctions, articulation and sequencing of activities, etc.); and teaching the content of the program (following the program, motivating students, selecting and organizing resources, evaluating learning, etc.).

The classroom management denotes a competence of the teacher associated with his or her pedagogical knowledge and the context of teaching and that develops through the experience during his or her teaching trajectory. From this perspective, investigations about classroom management should be carried out considering the real contexts of teaching, from which can emerge indications of the main aspects considered by the teacher in the process of organization and management of his or her activities before and during his or her teaching practice.

Statement of the Problem and Purpose of the study

The classroom management is a subject little addressed in educational research, but it configures a fundamental competence of the teacher for the referral of classes and for the maintenance of an environment conducive to learning. It is a capacity that encompasses content management, time, space and people, in order to guarantee the necessary conditions for teaching and learning. The researcher understands that teachers play an important role in classroom management and it is extremely relevant that teachers examine their classroom managements and techniques in order to create a safe environment conducive to learning for all learners. In addition, she believes that being an effective classroom manager is extremely important to successful teaching and learning process and effective classroom management plays an important role in student's classroom achievement.

Therefore, this research project has as its aim to seek for classroom management strategies that a higher education professor uses in the context of a course of Literature taught to 2nd year undergraduate students from CVPU- Cape Verde Public University (Pseudonym) located in Cape Verde. Furthermore, this paper will also address the role of the teacher in using classroom management strategies to establish or maintain

favorable conditions for learning and what classroom management practices do teachers implement in order to avoid behavioral problems.

II. LITERATURE REVIEW

According to the perspective of Amado and Freire (2009), the definition of classroom management includes the events that begin in the planning, with the organization and execution of each class held by the teacher “the orientation of questions and looks, reinforcements and incentives that he or she conveys to students” (Teixeira, 2011, p.115). Also it is included in this concept the evaluation that the teacher implements and the way how he or she manages and acts in relation to different conflicts and powers (Teixeira, 2012). Classroom management can also be described as the instructor responsibility to design and implement efficient classroom routines, policies, and procedures in order to ensure that students’ participate in class discussions, form cooperative learning groups, and accomplish class work, and several other classroom activities and interactions (Sterling, 2009). Classroom management can be also understood as the set of strategies adopted by the teacher, to maximize students’ cooperation and involvement and to reduce disruptive behavior (Arends, 1995; Wang, Haertel & Walberg, 1997, cited in Veiga 2013), maintaining an appropriate learning environment (Brophy, 1996; Djigic & Stojiljkovic, 2011). This concept involves the management of space, time and activities, as well as the management of student behavior, combining the characteristics of the teacher, his / her abilities and competences (Djigic & Stojiljkovic, 2011).

Classroom management is a fundamental step in ordering order, organizing teaching activities, and building an environment conducive to student learning. However, this theme receives little attention in teacher training courses and in educational research, particularly in the context of Higher Education, being a competence developed by the teacher during his teaching career. The first research on the organization and management of the classroom focused essentially on issues associated with order in the classroom, not establishing a direct relationship with the construction of a suitable environment for teaching and learning (Doyle, 1986).

However, since the 1980s, research has gone beyond the limits of order and has been associated with classroom management in teaching and learning processes (Gauthier et al., 1998). From this perspective, Doyle (1986) extends this concept, including the learning dimension, and conceives classroom management as a cognitive activity that allows teachers to anticipations that reduce the need for improvisations in order to promote learning. For the author, classroom management “consists of a set of rules and arrangements necessary to create and maintain an orderly environment conducive to both teaching and learning.”

Sterling (2009) emphasizes three fundamental dimensions of classroom management present in educational research: the management planning, the classroom management in a situation of interaction with students, and the evaluation and control of the classroom management activities. The first dimension refers to

the preparation and planning work that leads to a set of decisions related to the rules of coexistence and to the routines of class functioning, such as the sequencing of the activities and the implementation of a teaching plan. The second dimension refers to the application of disciplinary measures, the sanctions, the rules and procedures that govern the interaction between the agents of the classroom. It is, therefore, the supervision of the work of the students and the conduction of the dialogical interactions that are established in the classroom. The third dimension refers to the evaluation of the rules, procedures and disciplinary measures; therefore, it constitutes a reflexive activity of the teacher on the conduction of his or her classes.

The “management planning” is highlighted by the author as a fundamental stage of preparation for teaching, as stated:

The planning of class management begins not only with the preparation work, before the beginning of the school year, but also with the implementation and the communication of rules, procedures, relationships and expectations towards the students as soon as the year starts (Sterling 2009, p.29).

This planning begins before the beginning of a course and is established in the course of the classes, as a planning in action, particularly when the course starts, because this moment is fundamental so that the agents of the classroom know each other and the rules of Co-existence are shared (Sterling, 2009).

In the scope of Higher Education, Santos (2004), when dealing with the profile of the competent teacher, points out the ability to carry out pedagogical planning as a central capacity of this professional, who must “be clear about the objectives to be achieved in the development of the content with an adequate strategy and an evaluation that is consistent with what he or she has proposed. Plan your classes well and develop them competently (Santos, 2004, p.105).” Cunha (2009) evokes the concept of “participatory management” of the classroom as a characteristic of innovative experiences in Higher Education. In this process, the subjects involved participate in the classroom management from the conception of a planning for teaching to the analysis of the results, in which “there is a break with the vertical structure of power blaming the collective of the teaching and learning process through the proposals formulated” (p. 224). Effective classroom management not only permits the teachers to work with the pupils in a constructive and encouraging manner but also permits teachers to use preventative methods to avoid disruptions that are unnecessary (Schwartz & Pollishuke, 2013).

Thus, classroom management includes not only the physical appearance and the arrangement of the classroom, but also the classroom practices and rules, the responsibilities of the students required by the teacher, the student relationships, disciplinary actions, and the strategies the teachers use and the personalities displayed by the teachers.

Effective classroom management is extremely important because it helps students to be motivated, to exhibit appropriate behaviors, to boost confidence and enhance their learning. “Classroom management is a critical and complex component in the creation of effective learning environments” (Bennett & Smilanch, 1994, p.14). Richardson and Fallona (2001) state that the student learning and the classroom rules set by the teachers

are directly related, though, they consider that the most significant aspect is the classroom management set at the first week of the academic year. Also, Soodak (2003) argues in her research study, *Classroom Management in Inclusive Settings*, how the excellence of a classroom environment permits students to feel comfortable, safe and encouraged. When these aspects are present in a classroom the students' learning improves and misbehavior and disciplinary issues are reduced. Wentzel (2003) states in *Motivating Students to Behave in Socially Competent Ways* that when students have a strong sense of belonging it helps them to achieve good outcomes, encompassing educational motivation, a sense of effectiveness, and emotional well-being. "Also, a strong sense of belonging has been related with a desire to learn and an increase in understanding, while a lack of belonging has been related with undesirable educational outcomes such as absence and withdrawal from school" (Mansor et al., 2012, p.37). Therefore, effective classroom management is considered to be important not only for the classroom achievement, but also for the accomplishment of students' wellbeing and learning and for encouraging appropriate behavior. The use of classroom management skills may be a key component to help students to engage in the classroom. Usually one of the consequences of lack of engagement in the classroom is students' misbehavior. When students are not engaged in the classroom, they will get bored, resistant to teacher's instructions, which may cause conflict in the classroom if teachers do not possess classroom management skills to control this kind of situation.

Roache and Lewis (2011) discuss the relationship between students and teachers, and its effects on students' misbehavior in their study entitled *Teachers' Views on the Impact of Classroom Management on Student Responsibility*. In this study, they put together different views of different authors in relation to "student-teacher" relationship and how it is related to student behavior. One of the approaches they discussed is Canter's (2010), and it falls into a "teacher-oriented" model, which means that the teacher has clear expectations of students' behavior, and what is considered good behavior is enforced by rewards, while on the other hand what is not considered good behavior is addressed by "appropriate punishment". Another approach, supported by Gordon (1974) is the "student-oriented" one. The ones that defend this approach, for instance Gordon, believe that "obedience" is not the key for students to develop responsible behavior, but they should follow a "self-regulatory" process, where they are responsible for controlling their own behavior (Roache and Lewis, 2010). Furthermore, Roache and Lewis also discussed a "group-oriented" approach, which is supported by researchers like Dreikurs, Grunwald & Pepper. These researchers believe that students develop responsible behavior by forming decision groups, with the teacher as a guide to help them follow through the rules (Roache and Lewis, 2010). Dreikurs is a pioneer in the study of behavioral issues, but unfortunately I could not have access to any of his primary studies.

Roache and Lewis had the purpose to examine teachers' points of view on classroom management strategies and the perception they have of the relationship between students' responsibility and these strategies. This study was conducted in Australia, with 145

primary and 363 secondary school teachers. Questionnaires were applied, and after analyzing the data, the researchers found that when students misbehave in the classroom teachers become concerned, and they tend to adopt management strategies like punishments that instead of solving the problem may cause students to misbehave even more. One of the important issues that this primary research shows is that the use of punishment in the classroom may not necessarily be a good way of managing students' misbehavior.

The Classroom Management Idea Book created by Peace Corps (2008) also discusses strategies that teachers can use for a well-managed classroom:

1. Create a motivational environment by getting students involved in classroom activities. It is very important that teachers give students clear directions at the beginning of classes so they know what they are expected to do. It is also important that teachers demonstrate constantly that they believe every single student have the ability to learn.
2. Make every minute count by planning each lesson in advance, and by writing down every learning objective. Not every teacher may think of it, but it is important to be prepared with an emergency lesson or activity in case anything out of the ordinary happens.
3. Be prepared for students' misbehavior, which might be a challenge for teachers. One good strategy is to begin the school year by sharing with students the concept of misbehavior, and to establish a working system with rules and consequences. To make this more effective, allow students to participate in the creation of consequences for breaking the rules in the classroom.
4. Keep everyone engaged, because when students are challenged to think actively, they get involved in learning, which helps them develop critical skills. It is also important to always praise students for their willingness to try and answer questions.
5. Be creative, this is where teachers really put into action their ideas. They can use resources such as pictures, maps, activity ideas, arts and crafts instructions, magazines, and all materials they may find helpful to their classroom.
6. Give students choices, for instance, when found in situations where teachers have no choice unless to punish students misbehavior, it is a wise strategy to let students choose between two possible punishments, Peace Corps (2008).

Furthermore, the problem of students' misbehavior is one that goes beyond the classroom. Rusby (2011) related the school environment and school staff procedures to students' behavior. In her study entitled *Observations of the middle school environment: The context for student behavior beyond the classroom*, she discussed school environment and school staff procedures as very important in helping students develop appropriate behavior. Rusby believes that staff management procedures and environmental factors have the power to positively or negatively influence students' behavior. The use of clear rules and effective behavior management are important for a good "staff-student" relationship, and the lack of such environment can result in students' behavioral problems (Rusby, 2011). While conducting this study, students from 18 middle schools were used as participants, and the methodology was

based on observations. Observers/research assistants were trained and placed in the schools as to assess staff and students' behavior. As there were different environments in each school, there were obviously differences found in students and staff behavior. Most importantly, it was found that staff practices were deeply related to student behavior.

I do believe that school atmosphere, as well as home atmosphere, are important factors in controlling the problem of misbehavior. Most students have behavior problems because they have a difficult relationship at home, because they face violence, or because the family structure is not efficient in providing values that are important for someone to be able to develop positive behavior. Schools have to be equipped with staff members that are trained and able to deal with students that bring behavior problems from home. According to Stormont, Reinke & Herman (2011) "...schools currently lack systematic and coordinated efforts to meet the mental health and behavioral needs of students...". In their study entitled *Teachers' Knowledge of Evidence-Based Interventions and Available School Resources for Children with Emotional and Behavioral Problems*, Stormont, Reinke & Herman (2011) discussed a set of behavior interventions that can help teachers and schools deal with students with behavior problems. One of them is the establishment of "tiers of support with increasing levels of intensity" to reduce or prevent behavior problems. At a general level, all students receive the same instructions for correct behavior. Once teachers determine that these instructions are not efficient for certain students, they provide those students with additional intervention, which are generally conducted in small groups. In case these additional instructions do not prove to be efficient for certain students, teachers have to use specific strategies for students' individual needs. In that case they will have to develop a specific plan to address the behavior problem (Sugai et al. 2000, cited by Stormont, Reinke & Herman, 2011).

In this study, the researchers aimed to find out the knowledge of teachers about intervention programs to help students with behavioral problems, and the methodology used was the application of surveys. Participants included 239 teachers (early childhood and elementary education) from 5 school districts. This research comes to show that teachers have a very limited knowledge of the programs available; however, this cannot be generalized. The results apply only to the teachers that participated in the study; nevertheless, the same research can be conducted in different schools and districts. It is important to add that in addressing students behavior problems, I believe that teachers have to work together with parents for more efficient results because, as I mentioned above, behavior problems may be caused by family environment problems, and in that case teachers alone cannot achieve desired results while using strategies for behavior problems. The next chapter will provide detailed information on the methodologies used in conducting this research.

III. METHODOLOGY

Sample Population

One professor from the CVPU- Cape Verde Public University (Pseudonym) located in Cape Verde participated in this study. The professor investigated is a Master in African Literature and Languages and he acts as an English Professor in Higher Education for more than 20 years and he is recognized by his peers and students as a competent teacher. For more than 15 years he has been the coordinator and professor of a Literature course offered annually to 2nd year undergraduate students of the English Studies course. I chose this professor because he has stood out for years in the institutional evaluation carried out at the end of each semester, in which students evaluate their teachers through a questionnaire.

Having in mind the purpose of this study, this research focused on qualitative data collection. With the purpose to get the necessary information in order to answer my research questions the instrument that was used to collect the data of this study was semi structured interviews. According to McDonough & McDonough (2004) are those interviews "that have previously idealized questions, but giving the researcher flexibility to change the order and format of the questions" (p.183). With the purpose of obtaining the information necessary to answer the research questions it was chosen one data collection instrument as a way to avoid doubts arising during the data collection phase and to ensure the clarity of the data.

Plan for Data Analysis

The data was collected from the performance of the professor in his Literature course integrated by twenty four undergraduate students and whose objective is to provide a global vision of the general principles of Literature. The course was structured from two central teaching strategies, which are: the "periods of studies" and "discussion groups". In the "periods of studies" students meet in groups of six to answer a set of questions about key concepts and information related to a topic in class. These questions were available in the handbook of the course delivered at the beginning of the course and were answered with the support of the textbook delivered by the professor at the beginning of the course. A period of study is performed in an average period of two hours. The group discussions are held with all students, organized in turn. It discusses problems that articulate the information and concepts addressed in the periods of studies. Such questions are available in the handbook or removed from the textbook. Each group discussion is performed in an average period of two hours.

IV. DATA ANALYSIS

After the collection of the data through the methodology discussed in chapter II, the data was analyzed in a statistically valid, reliable, and coherent way. As the purpose of this chapter is to establish how the data was analyzed, below is an explanation of how the instrument described in Chapter II was analyzed.

The data collection was done with the accomplishment of a semi-structured interview that was recorded in audio and video and integrally transcribed. Also it was used as a data source the teaching planning developed by the professor for this course. The interview aimed to mobilize the professor's narratives about his knowledge and experiences about: the purposes and objectives for the teaching, the students and their understandings, the teaching strategies and the curriculum; considering the Literature course given to 2nd year undergraduate students of the English Studies in the first semester of 2016, more precisely during the month of November.

The professor points out the teaching planning as a fundamental step of his practice. This planning includes: the teaching staff, the summary of the course syllabus, A suggestion of bibliography for the course, the indication of websites with software for further studies, a description of the main teaching activities and evaluation criteria, a schedule with the content programming and activities that will be carried out in each class, a study guide for each subject, with questions and problems for the accomplishment of the period of studies and group discussions, and some appendices.

It is therefore a detailed and systematic planning that intends to anticipate the steps that the professor has chosen to guide his teaching. This planning is shared with the students on the first day of class, each of which receives a copy in the form of a handbook. On that day, the professor presents his teaching approach, clarifies doubts and initiates teaching activities. In this way, the students can have an overview of the course and the subjects and activities that are scheduled for each day of the class. At the beginning of the course the professor tends to be more attentive to the group, since it is a moment of adaptation and incorporation of the teaching strategies adopted in the discipline. However, as the students incorporate the dynamics of the classes and become more autonomous, the professor starts to interfere less and less in the learning process.

The class schedule is adjusted according to the progress of the course and if the students advance beyond the proposed one, the teacher proceeds to approach the following subjects. The following is a clipping of the calendar provided by the teacher in his teaching planning, in which he proposes an estimated period to approach a set of subjects.

Month	Day/period	Activity and Subject
November	14(morning)	PS - Non-Fiction - Objectives 1-5.
	16(morning)	GD - Non-Fiction - Exercises 1-5.
	21(morning)	PS - Fiction Part I - Objectives 1-10.
	23 (morning)	GD - Fiction Part I - Exercises 6, 7 and 9-12.
	28 (morning)	PS - Fiction Part II - Objectives 2-9.
	30 (morning)	GD - Fiction Part II – Exercises - 2, 3, 4. Quiz I.

Table 1 - Calendar clipping of the subjects and activities drawn from teaching planning.

In this section, it is presented a program for the teaching of two subjects: fiction and non-fiction. It can be observed that the time available for the approach of each subject is varied. To address the subject "Fiction" the professor suggests one period and to address "Non-Fiction" he also suggests one period. To set the time necessary for the approach of each subject requires the professor to know about the quantity of matters associated to each subject, the strategies used and the stage of students' development.

It is essential for him that the studies are carried out during the classes, as this will allow interaction among students, which for the teacher is an opportunity for them to develop "the skills and abilities", which are directly related to the two main teaching strategies proposed in the discipline, the period of studies and the group discussions. However, according to the professor the option of a group work requires more time for study in the classroom and this directly implies the selection of contents.

The choice of teaching strategies that favor interaction among classroom agents suggests that the teacher's approach does not prioritize the teaching of conceptual contents and corroborates with its purpose that students develop skills and abilities. Another aspect that stands out in the teacher's approach is the organization of teaching activities, which begin with the period of study, continue with the group discussion, and at the end of a cycle of subjects the students hold a "Quiz", which for the teacher "is a learning strategy, it is not an assessment of what they already know. It's a way for them to learn." This structure is maintained throughout the discipline, being interrupted only for the application of one of the three official evaluations proposed in the discipline. The group work also requires an adequate space and infrastructure, as the students need to organize themselves into groups and move through the classroom. Therefore, in order for the periods of studies and group discussions to be carried out, it is important that the chairs can be moved and that the class is not composed of a large number of students. The professor also emphasizes that it is "essential in this type of work, they have literature, they have what to read, this is necessary, and otherwise you cannot do the period of study".

The context in which learning will take place is an element considered by the teacher in the definition of his strategies, because in order for the activities to be carried out and achieve their purposes, it is fundamental that the necessary structural conditions and human resources exist. The professor also emphasizes that his approach requires the interaction between the professor and the students and, therefore, numerous classes make difficult its implementation. During the periods of study, students are free to leave the room and perform their activities at the pace that is convenient for them. The professor reveals that he deals with his target audience in a flexible way and he seeks to create a pleasant learning climate. The professor reveals to have knowledge about the characteristics of his target audience, who are young and adolescent, and so it does not require a rigid posture of his students. For him, a posture with more flexibility

does not imply lack of seriousness neither of the professor nor of the students and that the structure of the discipline allows the students to know the dynamics of the classes and to take responsibility for their learning. In the same way the professor deals with the control of the frequency in the classes. He proves to be quite flexible with the control of the students' frequency and even so, according to him, few are missing classes. For the professor, this is due to the fact that the students recognize the importance of participating in the classes and this can be an indication that the approach proposed in the discipline is approved by the students.

V. CONCLUSION

In this research it was possible to recognize that this professor conducts the classroom management considering: 1) his teaching strategies, 2) the elaboration of study plans for the students, 3) the strategic sequencing of his activities, 4) the organization of students in the classroom and (5) the human and material resources available for teaching. He emphasizes the importance of detailed teaching planning and presents a systematic organization of his activities based on the triad periods of study, group of discussion and quiz; which constitutes a central nucleus of activities that direct the teaching. Communication seems to be a fundamental component in classroom management, since the teacher provides his teaching planning to the students, in which he indicates his teaching objectives and strategies and reveals to be very flexible with the rules of coexistence in the classroom. His appreciation of teaching planning and the way he conducts his classes suggests that one of his goals is to create the conditions necessary for the students themselves to implement this planning and the role of the teacher is to oversee this process. In the case of this study, the classroom management seems to be associated with the teacher's concept of how students learn and their intentions for teaching. His emphasis on activities that provide interaction among classroom agents suggests that for him, learning is favored by interaction among the students.

It also suggests that learning is a gradual process, as students approach the fundamental concepts in period of studies, solve problems by relating these concepts in the group discussions and, finally, synthesize and register their understandings in the quiz. According to him, the choice of student-centered teaching strategies directly implies the selection of the contents for teaching and depends on some variables, such as: a small number

of students, an adequate space for teaching, support of monitors and didactic material for all students.

DOI: 10.29322/IJSRP.9.08.2019.p9245

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9245>

Abstract

Aim:- To assess and compare the prevalence of traumatic dental injuries among day scholars and residential school children and their association with predisposing factors, such as lip competence, molar relationship, overjet and variables such as age, gender and cause of trauma.

Methodology:- Cross sectional study was carried out among 250 residential and 250 day school children aged 9-14 years of South Bangalore. All the children were examined for traumatic dental injuries, its related cause, incisal overjet, molar relation and lip competence using mouth mirror and probe under day light.

Results:- Statistical analysis was done using SPSS version 22.0. Prevalence of dental injuries was 18.2% , commonly seen among boys of residential school aged 13-14 years. The increased prevalence of traumatic injuries was found with Class I molar relation and increased overjet in children with potentially competent lips.

Conclusion:- Increased prevalence of dental trauma among school children stresses the need for awareness towards prevention and treatment.

Index terms:- Cross sectional study, Prevalence, School children, Traumatic dental injury

INTRODUCTION:-

Several millions of people are injured by trauma every year that has multitude of consequences for not only the traumatized individual but also the family members and society. Oral region comprises as small as 1% of the total body area but accounts for 5% of all bodily injuries¹. Oral injuries are more common among the children and the adolescent. Studies have shown that 71-92% of all the TDI's sustained in a lifetime occur before 19 years of age and begin to decrease after 24-30 years². Since there is decline in the

prevalence and severity of dental caries among children, attention has been drawn to other aspects of oral health such as traumatic dental injuries³. These injuries range from simple enamel fractures to severe damage involving the displacement or avulsion of teeth⁴.

Prevalence of traumatic dental injuries has markedly increased in the past few decades. Existing data on prevalence of traumatic dental injuries carried out in different countries have shown that the prevalence of incisor trauma ranges from 6%-34%⁵. This difference may be attributed to age of the study participants, gender, sample from which participants were drawn and criteria used⁶⁻⁷.

Oral health is an integral part of general health. Oral cavity has a multitude of function. Decreased food intake due to oral pain and poor dental status can cause low growth in children. The position and appearance of anterior teeth have a psychological and a social impact on children and hence any injury to the anterior teeth will affect the child's quality of life. It also causes difficulty in speaking clearly and feeling embarrassed to smile or to show the teeth⁸⁻¹¹. Studies have shown that traumatic dental injuries of permanent anterior teeth affects the personality and self esteem of the young patient and its management requires experience, judgement and skill⁸.

The causes for traumatic dental injuries are usually related to the age of the patient . In preschool children the most common cause for traumatic injuries are falls. In school age children injuries are most often caused by bullying at school, sports etc. In adolescents and young adults assaults and traffic accident are the most common cause¹. Predisposing factors include inadequate lip closure and increased incisal overjet of teeth¹²⁻¹³.

Several residential schools are there in Bangalore. In these schools there can be increased prevalence of traumatic dental injuries as there is no parental supervision, increased sports activities, collision, bullying, violence etc. Very few studies in the literature have assessed the prevalence of traumatic dental injuries among residential school children.

Hence the aim of the study is to assess and compare the prevalence of traumatic dental injuries among the day scholars and residential school children in South Bangalore and to correlate the prevalence of injury to the cause of trauma with age of the child, incisal overjet, molar relationship and lip competence of the child.

MATERIALS AND METHODS:-

A cross sectional comparative study was conducted among 500, 9-14 years school going children of both genders from South Bangalore. Ethical clearance was obtained from the Institute's ethical committee. List of Day scholars school and Residential schools was obtained from the Department of Public Instructions. Permission was obtained from school authorities and study schedule was prepared. On the scheduled day the school was visited to collect the data.

Healthy children of the age group 9-14 years were included in the study. Children with permanent anterior teeth lost due to caries or causes other than trauma, children with partial or complete anodontia involving permanent anterior teeth and children undergoing orthodontic treatment were excluded from the study. Informed consent was obtained from both the parents and participants included in the study.

The study was undertaken in 2 parts :- Clinical examination and structured interview.

Clinical examination:- Information regarding age, gender and school was noted down. Clinical examination was done using mouth mirror and probe under day light to examine the number of teeth injured, type of injury, lip competence, molar relation and the overjet. The injured teeth were classified using the Andreasen's epidemiological classification of TDI's including codes of the World Health Organization International classification of diseases to dentistry and stomatology (1997). The Community Periodontal Index Probe for Treatment Needs was used to record the overjet. The molar relationship was recorded using Angle's classification (Angle's class I, class II and class III). Lip competency was recorded as competent lips, potentially competent and incompetent lips when the patient was seated upright and in relaxed state. Lips were noted as competent when the lips were in slight contact when the musculature is relaxed. Subjects with morphologically shorter lips not being able to form a lip seal in relaxed state and who required active contraction of perioral and mentalis muscle to form a lip seal were categorized to have incompetent lips. Subjects with normal lips that failed to form a lip seal due to proclined upper incisors were categorized to have potentially competent lips.

Structured interview:- Structured interview was conducted where the children were verbally asked to state the cause of injury that was documented as fall, collision, road traffic accident, violence, cannot recollect and miscellaneous. Miscellaneous category included biting on hard objects like pen, pencil etc, opening of bobby pins, soda bottles. Other information like duration since the injury occurred (<1 year, 1-2 years, > 2 years and cannot recollect) and if any treatment was taken for the injury was also noted down.

STATISTICAL ANALYSIS:-

The data was collected and tabulated and was analyzed using SPSS software V.22, IBM., Corp

Descriptive analysis of all the explanatory and outcome parameters was done using mean and Standard Deviation for quantitative variables, frequency and proportions for categorical variables.

Chi Square test was used to compare the difference in the distribution of responses for estimating the prevalence of dental injury between the Residential & Day Scholar school children.

Independent Student t test was used to compare the mean dental trauma Index scores between Residential & Day Scholar school children.

The level of significance was fixed at $P < 0.05$.

RESULTS:-

A total of 500 children, 250 from day scholars school and 250 from residential school were included in the study.

Difference in the prevalence of dental trauma between the males and females was stastically significant with higher prevalence of trauma seen among males of residential school (26.7%).

Difference in prevalence of dental trauma between day scholars school and residential school was statistically significant with p value less than 0.05 with a higher prevalence of trauma seen among Residential school children (23.6%).

A stastically significant difference in prevalence was observed between the age group 11-12 years of day scholars school and residential school. but difference in prevalence observed in 9-10 years and 13-14 years was not statistically significant.

In this study the most highly affected tooth was 11 (10.6%) followed by 21(10.4%]. Least affected being 22 (3.2%) followed by 31 and 12 (0.8%). Code 2 injuries (enamel fractures) were come common followed by Code 3 injuries (enamel and dentin fractures).

In the present study most of the subjects were not able to recollect the cause of injury.

Majority of the study participants had Angle's Class I molar relation followed by Class II and very few Class III.

Among these class I with bimaxillary protrusion has had highest prevalence of trauma followed by subjects with Class I (18.7%) and Class II (14.5%).

High prevalence of trauma was seen among subjects having potentially competent lips (42.9%) followed by subjects with incompetent lips (25%). The prevalence was low among subjects with competent lips (15.9%).

High prevalence of traumatic injuries was seen in subjects having overjet of 5.6-8.5mm in both day scholar school and residential school (42.9% and 31% respectively). Lower prevalence was observed among subjects having overjet of < 3.5 mm (7.6% in day scholar school and 20.9% in residential school).

DISCUSSION:-

Traumatic dental injuries are a challenging problem to the oral health professionals³. Unfortunately public is unaware of the risk and does not have enough information to avoid traumatic injuries to the teeth. Although prevention of TDI is the most desirable action, oral health promotion through well structured oral health education program can create positive change in awareness for special group such as school children.

In this cross sectional study the total prevalence was found to be 18.2%. This result is in accordance with the results obtained by Traebert et al (16.6%) and Cortes et al (16.1%) and in contrast to the results obtained by David et al (6%) and Rai and Munshi (5.29%) . This difference could be due to variation of age of the study subjects, gender, sample from which subjects were drawn, criteria used and geographical and behavioural differences between study locations.⁶⁻⁷

In this study TDI's were more common in children of residential school and more commonly found in boys. The reason for increased prevalence of TDI in residential school could be due to increased participation in sports, recreational and physical activity¹⁴⁻¹⁵. Apart from this there is also increased bullying and violence seen in residential school. The reason for boys being more prone to TDI's could be due to their participation and involvement in more aggressive sports and vigorous outdoor activities than girls. The relatively low prevalence of trauma in girls can be explained by the fact that girls are generally more mature in their behavior than boys¹⁵. This corroborates with the findings of studies conducted by Ravishankar et al, Ahlawat B et al, Patel et al, David et al and Cavalcanti et al. These results are in contrast to Garcia-Godoy, where gender distribution was not significantly different.³

In the present study the highest prevalence of trauma was among 13-14 years age group children. Children at this age are usually more active, have psychomotor underdevelopment and poor motor skills and hence cannot precisely evaluate velocity and danger.¹⁴ This result is in accordance to the study done by Hedge et al where the peak age to sustain TDI's was 13-14 and study done by Govindarajan et al and Prabhu et al where more injuries were found in 10-13 year old children.

In this study most commonly affected teeth were the maxillary central incisors. This could be due to the anatomical position of the maxillary incisors which are often associated with presence of overjet and inadequate lip closure.^{5,7,10} Also these teeth erupt early that put them at risk for a longer period of time¹⁴. This result is in agreement with the results obtained by Mona et al and Nik-Hussein et al. In this study fractures involving the enamel were more common followed by fractures involving enamel and dentin^{8,10,14,15} which is in accordance with the results obtained by Garcia-Godoy et al. TDI's usually affect single tooth but certain events may lead to multiple tooth injury as well.²

Conclusion could not be drawn for the cause of the injury in this study as majority of them (78%) failed to recall the cause of trauma. The most probable cause for this could be due to high prevalence of minor injuries, for which children and parents were not concerned by the traumatic event and forgot its circumstances in a short time¹⁶. Future study by interviewing the parents and teachers about the cause will throw light and provide some clue for the cause of TDI's among children. The 2nd most common cause of injury was fall. These results are in contrast with Govindrajana et al where the most common cause of TDI's was fall and the second most common cause was of unknown origin.

In the present study majority of subjects with TDI did not refer to dentist for professional assistance. Lack of adequate knowledge and proper motivation of both parent and dentist along with the limitations imposed due to socioeconomic constraints and high cost of treatment could explain the reason for untreated injuries⁶. This result is in accordance with the study conducted by Nik-Hussein and Gupta et al. Considering that TDI's can have a psychological and social impact on children, the required treatment should be promptly provided. Studies have shown that prompt treatment provided within 24 hours of injury reduced the chances of pulpal death and further complications¹⁷.

In the present study majority of the subjects had Class I molar relation and subjects with Class I bimaxillary protrusion had high prevalence of TDI followed by class I malocclusion which is in accordance with the results obtained by Govindarajana et al. This is in contrast to the study conducted by Dua et al where high prevalence of TDI was found in patients with Class II div I malocclusion.

High prevalence of TDI was found in patients with potentially competent lips. Lips provide protection to anterior teeth by avoiding excessive exposure of these teeth and thus a lack of lip coverage infers greater risk of TDI^{5,9,16,18}. These results are in agreement with the study conducted by Prabhu et al, Govindarajana et al and Mona H et al.

Significant association was found between the occurrence of anterior tooth injury and increasing overjet. The most probable cause for this could be that the increased overjet would result in more forwardly placed anterior teeth and this more prominent position in turn would make these teeth more vulnerable for trauma^{5,9,16,18}. These results are in accordance with El-Kalla et al, Cortes et al, Borzabadi-Farahani et al and Artunet et al.

CONCLUSION:-

High prevalence of TDI is seen which can be minimized by routinely conducting screening camps in schools to identify children who are at risk for TDI. School teachers should be educated regarding the emergency management of TDI. TDI's have both physical and

psychological impact on the child hence educational programs emphasizing the ways to prevent dental trauma and the benefits of seeking immediate treatment for the conservation of fractured teeth should be instituted.^{14,16}

Lead Activity In Blood Of Children In Crude Oil Polluted Sites Of Niger Delta – Nigeria

George, Siyeoforiye Precious

Department of Medical Laboratory Science, Niger Delta University, Wilberforce Island, Bayelsa State, Nigeria.

DOI: 10.29322/IJSRP.9.08.2019.p9246
<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9246>

Abstract- Crude oil contains lead as one of its heavy metals. The Niger Delta is vast with oil facilities that is capable of causing pollution to the environment. Lead is a toxic metal that has affected the children exposed to these polluted sites. This toxicity causes severe brain damage, neuropathy, weakness and many more. Therefore, the detection of this metal is very important to know its threshold in the blood. The source of intake could be in the air or through agricultural produce from these polluted sites. From this study, Mean value for children exposed is 40.1 μ g/dl while the Standard Deviation is 30.9 μ g/dl. This also affected their Intelligent Quotient with value of 40%. The children that are not exposed, have their Mean value of 3.4 μ g/dl while the Standard Deviation is 1.6 μ g/dl and Intelligent Quotient as 60%.

I. INTRODUCTION

The Niger Delta extends over about 70,000km² and make 7.5 of Nigeria land mass. It is a petroleum-rich region and has been the centre of international controversy over pollution that has caused great devastation of land and human life. The crude oil that is being discovered has economically changed man's way of life and is a complex mixture of hydrocarbons with heavy metals. Lead which is one of the group of heavy metals that is found in crude oil causes metal poisoning in the body and the brain being the most vital part. The exposure route is the soil when being contaminated with crude oil and this percolate to affect the underground water, and the adsorption of plants of the metal.¹⁰ In the United State, 14 - 20% of total lead exposure is found in drinking water, and the Centre for Disease Control has set the upper limit for lead in the blood for adult at 10 μ /dl.⁷ At low lead concentrations 95 to 99% of blood lead is bound to red blood cells (RBC) and 1% is found in the plasma, while at higher lead concentrations, a larger percentage of lead is distributed in plasma. Plasma lead is relatively easily exchanged into bone and soft tissues such as the kidney and the brain. The amount of lead bound to red blood cells is reduced by half after approximately 36 days, also for lead found in plasma, the same process takes less than an hour.¹¹ In the soft tissues lead affects various cell processes and cause toxic effects. In bone, it replaces calcium and this is where 70 to 80% of lead is stored in children, compared to 90 to 95% in adults.¹¹ Lead can be stored in bone for years, and continues to accumulate throughout an individual's lifetime. The effect of lead is a concern in children that should be considered since exposure to lead in childhood may affect the lifetime. They are particularly vulnerable to lead poisoning because they absorb 4–5 times as much ingested lead as adults from a given source. Besides,

children's age and innate behavior of hand to mouth result in swallowing lead-containing or lead-coated objects, such as contaminated soil or dust and flakes from decaying lead-containing paint. The main disorders associated with lead exposure are emotional and behavioral disorder, muscle weakness, headache, weight loss etc.⁶ The mode of absorption of lead could be oral mucosa, nose or eye, and in children it is mainly by inhalation and food.¹ In further study, certain factors has contributed to lead poisoning such as occupational lead exposure, consumption of contaminated vegetables, playing in contaminated environment and low educational level.⁸ Studies has shown mean level of lead poisoning in children as approximately 57 μ /dl, which shows high lead poisoning among children.⁵ Also, in 2016, the institute for Health Metrics and Evaluation (IHME) estimated 540,000 death as caused by lead exposure.⁴ This has further caused concern for World Health Organization 1 of 10 chemicals of major public health concern and to protect health workers, children and women of productive age. However, the United State Centre for Disease Control considers 5 μ g/dl to be the reference blood lead level in children.⁵

Therefore, environmental pollution with crude oil and heavy metals has become a global problem. The contaminated soils are dangerous to health and is the only means by which human dispose waste for satisfaction. The crude oil pollution caused by pipe line rupture or vandalism in the Niger Delta of Nigeria, has created serious underground water pollution as contaminant infiltrate the soil up to 70 to 80cm depth or more.³ There was increase in concentration of metals in humans that were exposed to lead and chromium in industries, as samples were digested and analysed.⁹ There are many oil facilities in the rural areas of the Niger Delta, and are seasonally ruptured due to equipment failure, corrosion of pipeline and vandalism. The children at these locations are constantly exposed to lead during environmental pollution. This study will bring a close of gap of the knowledge in the danger affecting these children poor performances in education and a decline in Intelligent Quotient. This should be considered as a factor and be considered by environmental activist to protect the future of children exposed to lead and to build better nation. Although, chelators are available for treatment of lead in blood, but prevention is better than cure.

II. METHOD

The study was conducted in three rural communities in Okrika, Gokana and Akuku Toru Local Government Area. Samples of blood were taken from 60 children in rural and urban

areas, between the ages of 2 to 7 years. Children selected from urban areas are free from oil facilities (non exposed), while children from the rural areas are within oil facilities of spilled sites (exposed). The samples were taken to Rivers State University Teaching Hospital for analysis, and comparative study was done in there educational performance. Informed consent were taken from parents of these children before considered for the study. Also, the inclusive criteria were that, no previous lead poisoning case and weakness (anaemia), while the exclusive criteria are those of medical disease. The parents of these children provided relevant information about there children.

The basic apparatus used for in this study are pyrex glass of 50ml and 100ml, beakers, pipette and Atomic Absorption Spectrophotometer of frequency 100 – 400Hz. The reagents used are Hydrochloric acid (Hcl), Nitric acid (HNO₃) and Hydrogen peroxide (H₂O₂). A standard solution of lead was prepared as stock solution being diluted with 5% HNO₃ solution in distilled water. Reagent black was prepared using the stock solution and 5% HNO₃. The Atomic Absorption Spectrophotometer was used to analyse the blood sample. The accuracy being given priority, samples were prepared in duplicate.

The samples are digested using wet digestion process by adding 5ml of the sample into 10ml of nitric acid in a volumetric flask. It was then placed on a hot plate for temperature increase of about 150°C for 2 hours. The blood sample was then filtered and allowed to cooled. After the process of digestion, 10ml of H₂O₂ was added for complete oxidation process and further diluted up to 50ml.

III. RESULT

In this study, samples taken from children between the ages of 2 to 7 years is shown in table 1. The mean value for exposed children is 32.6µg/dl and standard deviation to be 14.4µg/dl, and this indicates increase concentration of lead. Also, mean value for the non-exposed is 3.4µg/dl and standard deviation to be 1.6µg/dl. In table 2, shows the percentage Intelligent Quotients of children in school age (5 to 7 years). Performance chart was used to enter children’s academic performance gotten from their teachers in school. The children exposed had percentage of 40% and non-exposed had 60% in performance.

Table 1
Mean concentration of lead in children exposed

	Exposed	Non-exposed
Sample size	30	30
Mean (µg/dl)	32.6	3.4
Standard deviation (µg/dl)	14.4	1.6

Table 2

Percentage Intelligent Quotient in children		
	Exposed	Non exposed
Sample size	19	19
% Intelligent Quotient	40	60

Figure 1, shows the concentration of lead against the non exposed children. In the graphical presentation, lower concentration was recorded in greater population of the children. Though, slight increase above 5µg/dl was randomly observed among the children. This could be considered as lead from other sources or transport of farm products from polluted rural areas to urban areas, and could be open for further studies. Also, figure 2, shows the increase concentration of greater children exposed to lead, having highest concentration of 60µg/dl with decrease concentration of 4µg/dl. Figure 3, indicates the percentage of Intelligent Quotient in exposed and non exposed children.

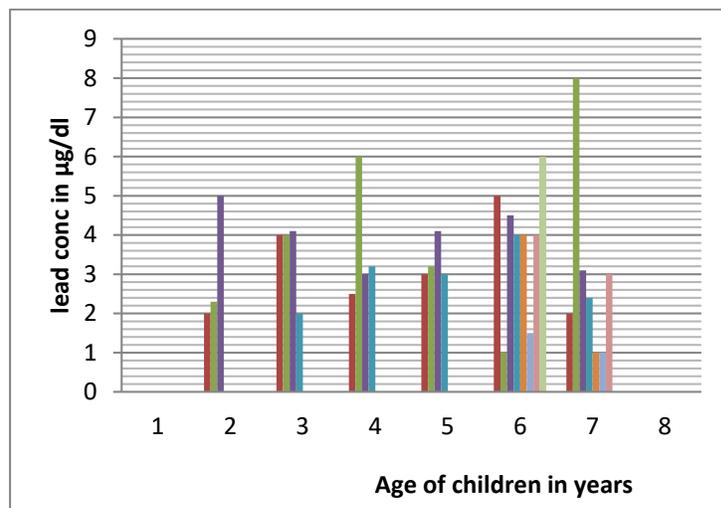

Fig. 1 Concentration of lead in non exposed children sample.

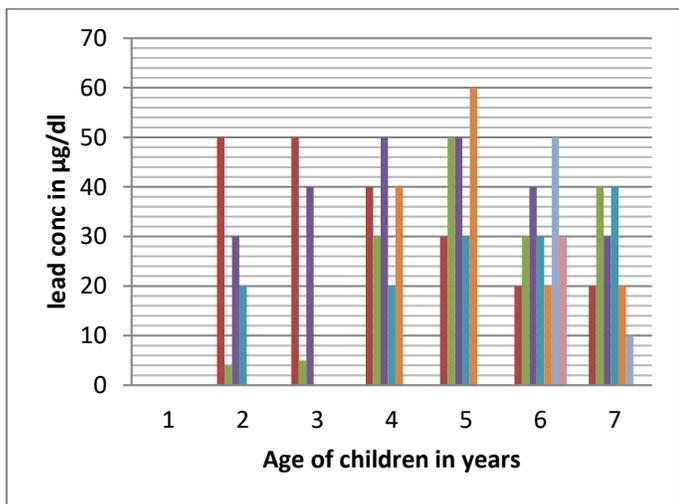

Fig. 2 Concentration of lead in exposed children sample

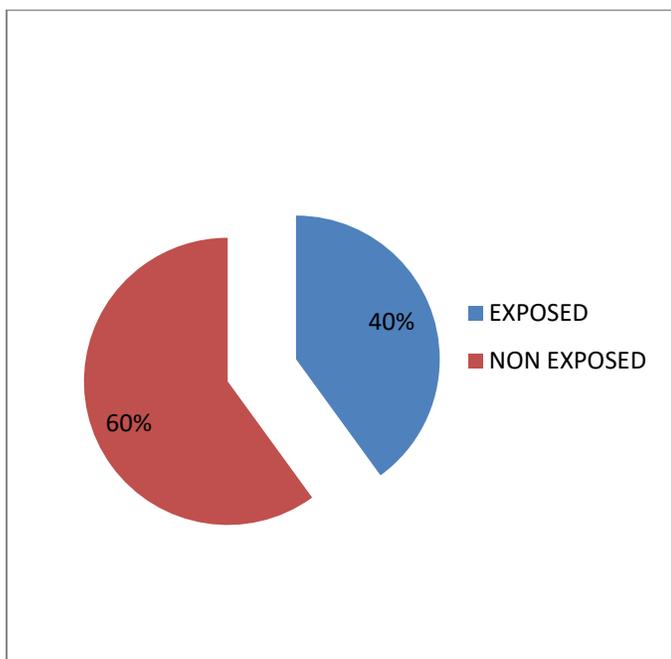

Fig. 3 Percentage of Intelligent Quotient

IV. DISCUSSION

In this study, the concentration range for lead in exposed children is 4 - 60 µg/dl while the mean value is 32.6µg/dl. Also for the non-exposed, the range is 1 -8 µg/dl while the mean value is 3.4 µg/dl. These values are found in children of 2 – 7 years carried out for this study in the rural area of Niger Delta exposed to crude oil spill, and those in the urban area not exposed to crude oil spill.

Studies have shown that symptoms such as drowsiness, exhaustion, convulsion and coma can occur in high lead concentrations of 100µg/dl and above ¹³. However, United State Centre for Disease Control considered 5µg/dl to be reference blood level in children ⁵. Studies have also shown that lead

exposure result from chronic exposure to low lead levels of ≤ 10µg/dl which causes neurological problem in children ³. Iranian’s children were found to have lead poisoning of value 57 µg/dl ⁵. Yale et al. studied British school children with lead concentration to have significantly lower Intelligent Quotient, reading and spelling score.

Presently in this study, the factor considered for increase lead in major crude oil polluted sites is pipeline vandalism and facility failure by oil industries. The children in the rural areas closed to these sites are exposed to risk factors. These crude oil contain heavy metals and of which lead is part. This should be a source of concern for the government to stop this menace and to protect the children from being exposed to lead. Also, children lead monitoring in diagnostic centres should be a concern to maintain their health and academic excellence.

V. CONCLUSION

The concentration of lead in children’s blood in these rural areas of Niger Delta, shows the risk of lead in crude oil polluted sites. This is a potential neurological problem in children and has caused low performance in learning. Government should protect the future of these children by creating awareness of danger in exposure to lead and having regular check in blood lead level in children with preschool and school age.

Universality Of Sankaradeva's Thought For Community Development: A Study Of Assamese Muslims

Darshana Goswami

Research Scholar

Deptt. of Com. & Journalism

Gauhati University, Assam

DOI: 10.29322/IJSRP.9.08.2019.p9247

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9247>

ABSTRACT- Srimanta Sankaradeva was the pioneer to disseminate noble thoughts of moral values and spiritual inspiration for the humanity and social harmony. Liberalization of these thoughts popularized his vision and cultural creations among different communities of Assam. It was a Vaishnavite movement; however, it widens the range of assimilation of dignified outlooks. Attributable to this, Assamese Muslims are one of the significant communities that inspired and accumulate several thoughts of Sankaradeva in their stream. This universality of spiritual bond and cultural involvement is a strong communicating mechanism which playing a vital role in community development of Assamese Muslims. Thus, this research paper is to study the universality and liberalization of Sankaradeva's thoughts for socio-cultural development in Assamese Muslim community that is incredibly noteworthy to highlight the different issues in modern context.

Key words- communicating mechanism, liberalization, universality, vaishnavite

I. INTRODUCTION

Sankaradeva's contributions reached the entire region of Assam influenced to get hold of social dignity and prosperity. It is significant to observe that Assamese Muslims are very attached with Vaishnavite thoughts. They have a unique rationalism which take apart them from other Muslims ideology. This is incredible to study the participation of Assamese Muslims in Sankaradeva's Neo-Vaishnavite tradition without changing the track from Islam. The adaptation and accumulation of Sankaradeva's thoughts into Islamic ideology is a living custom and to this research paper is to understand the socio-economic-cultural transformations for their community development.

II. OBJECTIVE

This research paper has been focused on its objectives mainly to study the Sankaradeva's philosophy of spiritual liberalization that inspired Assamese Muslims community to incorporate in socio-cultural life. Foremost emphasis is to study the contribution of Assamese Muslims to enhance Sankaradeva's vision as a communicating mechanism for greater community development. Also to understand the historic evolution, socio-cultural transformation of Assamese Muslims community and its future prospect with recent circumstance.

III. METHODOLOGY

This is a critical and analytical type of research. The findings of the research are based on two types of data i.e., the Primary data and Secondary data. Different information related to the adaptation and assimilation of Sankaradeva's philosophy by Assamese Muslims community from Sankaradeva era to modern period is considering as chronological edge is the primary data for the research purpose. After the data collection process, data analysis has been done. Also it includes various socio-cultural components of communication process which may establish the influence of Sankaradeva's philosophy in Assamese Muslims community as a vital dynamic aspect for community development.

IV. HISTORY OF ASSAMESE MUSLIMS

The term Assamese Muslim is stand for the religiously Islamic community who used Assamese language, folk culture and social tradition of Assam. Assamese Muslim is also referring as *Asomiya Musliman*. Historically, the Islamic tradition entered Assam during 1206 AD by the force led by Muhammad Bin Bakhtiyar, a turkey invader came to Assam through Tibet region. After this, from 15th to 17th centuries several Muslim invaders came to Assam and the so many conflicts took place were many prisoners stay put here. In between this, during 1662 AD a significant conflict occurred between Ahom dynasty and Mir Jhumla where according to a treaty a part of Assam was occupied by him. Afterward, this was again taken over by Ahom rulers. Along this, several Muslims officials were appointed by Ahom rulers in state of affairs and the acquaintances with Muslim society got increased. Simultaneously, many Intellectuals, Saints, Artists migrated to this province and enhanced Assamese Muslim community. However with the course of time, this region assimilated the Muslims people with indigenous people and culture. So many Muslims married to native girls, learned the local language, adapt folk culture and customs into their life. On the other hand, at that time conversions to Islamic creed also shown as a major fact in increasing the Muslim population. Nowadays, although they possess Islam as their religion but socio-culturally they are distinctive and vibrant which is far away from traditional Middle East Asian live hood and ideology. This is stated by Wikipedia that ' the Assamese Muslims probably one of the less orthodox Muslims communities of entire Asia. They follow many Hindu customs and take part in Hindu festivals'. Due to this distinguished socio-cultural assimilation with other indigenous communities, the Assamese Muslims evenly developed and continued as an imperative part of this multi-dimensional Assamese society.

V. SANKARADEVA'S VISION OF LIBERALIZATION

Sankaradeva was a great intellectual had immense observations on socio-cultural-political circumstance of that period. He understood about the mass appeal of his liberal philosophy of life but at the same time he well known of limitations of people in terms of acceptance. To integrate the multi-lingual, multi-coloured cultural heritage of Assam, Srimanta Sankaradeva formulated a unique form to retelling of motivational mythological stories through several artistic manifestations of drama, songs, sattriya dance etc. that never depicted rigidity of Hindu philosophy but proficient to generate universal platform and huge popularity.

Although the Neo-Vaishnavism is a stream of Hindu religious vision and practice but it is more flexible and progressive. In early period of Sankaradeva, there were so many different deities and mainly living animal and human were sacrifices in the name of *Sakti pujan*. Along this, so many blind beliefs and merciless rituals took place and the social system suffered a lot. To abolish these malpractices and to provide an appropriate divine pathway towards humanity, Sankaradeva introduced EK SARAN NAM DHARMA. *EK SARAN* is referred to be under the guidance and direction of the single God who is not other than Lord Krishna who described as *Palankarta* i.e., the protector of humanity and social values. Instead of offering many things, the three fundamental practices are formulated to worship the single God are *Kirttan*, *Smaran*, *Bandan*. *Kirttana* is to express and execute the glory of Lord Krishna in the form of poetic illustrations that articulated by Sankaradeva. *Smaran* is to bring the instructions learned from *Kritan* and Guru (the mentor) to the mind. *Bandan* is the devotional expression of thoughts towards Lord Krishna and the *Guru* for all those we learn about this world and humanity. To perform and practice these values Sankaradeva established *Sattra* and *Namghar* across the regions which were residential spirituality learning institutions and community prayer houses, respectively. *Sattra* are headed by *Gosain*, a spiritual leader who teaches moral education, social values to disciples, students and followers. And the *Namghar* are the native prayer houses where people of the locality gathered for worship practice and perform the spiritual learning in various art forms like, *Bhaona*, *Sattriya* dance, *Borgeet* presentation. These institutions are widely open for all irrespective of caste, creed, and gender that they can participate in the services and can enjoy the cultural performances.

According to the Census report of India, 1891, it is stated about the Vaishnavite influence on outcast that "when the neophyte takes the Saran, the Gosain inculcates a few moral precepts such as 'Obey your parents', never raise your hands against them', 'be always respectful to elders', tell no falsehood' etc. He then sprinkles sacred water over them and bless them. Having done this he takes his fee and departs. He interferes no farther with their old religious beliefs, nor does he insist on their abstaining from eating pork and drinking rice beer." (Para-233 Vol.1- Chapt-8). It can be assumed that Sankaradeva's philosophy of spirituality distinctly possess the path of moral, social values which does not stress to change the religious or individual identity. Therefore, beginning of Sankaradeva's

era to modern period, along with a number of tribal communities; Assamese Muslims community equally feels enlightened to incorporate Sankaradeva's school of thoughts into their life and culture.

VI. SANKARADEVA'S PHILOSOPHY IN ASSAMESE MUSLIMS COMMUNITY

Srimanta Sankaradeva's one of the distinguished disciple Chandkhai was a Muslim. He was well known for logical account. It stated that Chandkhai had seen Sankaradeva's divine form. He inspired a lot by the Sankaradeva's liberal outlook towards an outcast person like him. Chandkhai became a follower of Sankaradeva and he composed several devotional songs which spread out the message of Sankaradeva on spirituality, morality and humanity. Subsequently, a number of Muslims people were acquainted with Sankaradeva's EK SARAN NAAM DHARMA, and assimilation of Vaishnavite and folk cultures were put into practice.

VII. IMPACT ON ASSAMESE MUSLIMS

About 250 years before the birth of Sankaradeva, the Islamic ideology entered to Assam however the Sankaradeva's philosophical transmission motivated Assamese Muslims community to recognize the multi-cultured foundation of socio-cultural development. It is observed that the institutional structures of *Sattra* and *Namghar* are also established in Muslims community. In 1891, Census report of India stated about this. In Jorhat sub-division of undivided Sivasagar district, presently in Jorhat district there were about sixteen thousands of Muslim populations. The report says that Assamese Musalmans followed the Hindu customs and religious structure. Further this, they have their spiritual leaders i.e., *Gosain*. It was mandatory to all the Muslims populace get attach to the *Gosain* for acquire the knowledge of individual-social values. Namely, *Halungpuria Gosain*, *Bakirpuria Gosain*, *Hak Khoa Dewan Gosain* are some Assamese Muslims *Gosain*. Notably, *Bakirpuria Gosain* is name after the first *Pir* of the line *Bakir*. They have their own *Sattra* where resident disciple (*Bhakat*) used to live who desist from matrimonial or other physical relationships. *Gosain* are be given the offerings from other non-residents followers and disciples. The authorized village chief is called as *Gaonbura* who is appointed by *Gosain* with a turban as a symbol of recognition. Under him a number of *Barik* or peon worked and collect the offerings. In Darrang district, *Damodoria Boragi Sattra* is considerable to have a Muslim family tree that was converted but still participates in *Sattra*'s various programs.

On the other hand, the edifying practices of devotion are basically the good habits of lifestyle. Sankaradeva's philosophy of *Sanskar* i.e., reform for personal, mental and social health and hygiene. Realizing the fact, *Sayan Sadachar*, *Bhojan Sadachar*, *Goyon Sadachar* are introduced which says about the daily routine of sleeping, eating, moving to somewhere etc. Similarly, for mental recreation spiritual activities like singing the devotional songs accomplish with several instruments. It is observed that many Assamese Muslims follows these routines. As well as, while praying they perform rhythmic clapping which is similar to *Kawali* performed by *Sufis*. Such comparable

integration of Vaishnavite thoughts and Islamic culture is assumed to lead the *Baul* culture in Bengal region. It is also seen that integration of Vaishnavite ideology and Islamic tradition brought out folk songs like *Kabira Geet* or *Baadshahi Geet*, *Fakirali Geet*, *UjaUtha Geet* or *Aituti Geet*. Among this, the women participation is a significant element to understand the gender egalitarianism in Assamese Muslims.

In 1630, Azan Fakir a notable Sufi saint came for exploration and distribution of Islamic ideology in Assam. It was about eighty years after the death of Sankaradeva and Azan Fakir found that the Islamic thought of Assam is already absorbed Neo-Vaishnavism of Sankaradeva. They took part in singing of *Kirtana*, took *Prasad*. He understood the universal acceptance of Sankaradeva's philosophy and himself introduced a liberal form of Sufism. He composed *Jikir* and *Jaris* in the pattern of Vaishnava songs i.e., *Borgeet*. *Jikir* and *Jaris* put up with the similar spiritual and humane values to deliver socio-cultural harmony.

Significantly, in Azan Fakir's period there were no mosques among local Muslims in lower part of Assam. There were only community prayers houses *Namghars*. *Sattra* culture is not confined within the frame of spirituality but it leads socio-political-cultural developments of village and the state. In addition, it is to mention that in united India of Pre-Independence period, at Dhaka there were so many Muslims disciple of Madhupur Satra, Coch behar. From this point, it can be understand that the Sankaradeva's establishments straightforwardly influenced the Assamese Muslims community.

VIII. SANKARADEVA'S IDEOLOGY IN COMMUNITY DEVELOPMENT

As per the census of 2011, the Muslims population is about 34% of total population of Assam. Among these, a large number of Muslims are Assamese Muslims who possess liberalized socio-cultural life. From British rule, although there is the Muslim Personal Law (1937) and Sharia Law for Muslims community but Indian constitution provides equal rights to all citizens a Uniform Civil Code under article 44. Hence, as stated earlier, Assamese Muslims are holding global outlook about their socio-cultural development. Looking into the Human Development Index (HDI) according to Open Government Data (OGD) Platform Although the literacy rate 68.5%, which is lowest in the country, and for instance the literacy rate of Assamese Muslims is higher than this with 73.18 % age. Putting this point, social status, gender equality, mass participations are very customary for Assamese Muslims community. Because of the progressive approach a large number of scholars, eminent personalities come out from Assamese Muslims. Namely, Baag Hazarika, the Brave Commander of Ahom Kingdom, former President of India Fakhruddin Ali Ahmed, Anuwara Taimur, the only woman Chief Minister of Assam, Dr, Maidul Islam Bora, the first Assamese Doctorate, Mahanmmed Saadulah, the only Assamese member of the drafting committee of the Constituent Assembly, Fardina Adil, the first Assamese woman IAS officer, Padma Bhshan awardee Vocalist Parveen Sultana, distinguished writer Syed Abdul Malik and many other prominent figures glories the state and the nation.

This revealed the potency of the Assamese Muslims community is enlightened by high social values articulated by Sankaradeva and the disciples to generate greater Assamese community.

IX. CONCLUSION

Sankaradeva says, *Kukur srigal gadorghoru atmaram, Jania sobaku pori koriba pronam* (11/17/33 bhagawat). It means all the living creatures whatever it may be all are to be valued. Consequently, all the people of any caste, creed, and gender they are imperative & respected. These high principles also delighted Mahatma Gandhi, the father of nation who said, “A great Vaishnava revival under Sankaradeva in the sixteenth century has made Assamese people kindly, tolerant and humane. There is no sign anywhere of that form of untouchability which is to be found in South India. Assam, indeed, is fortunate for Sankaradeva has five centuries back, given the Assamese people an ideal, which is also the ideal of Ram-Rajya.”

Today, some rigid and aggressive Islamic elements is leading a faithless environment in the world. To abolish these it need to open the thoughts in a global way. Beyond the religious customs and acquaintance, Global community can incorporate Sankaradeva’s ideology of social ethics and kindness. It can be comprehend that accepting the institutional and structural sketch of Neo-Vaishnavism; the Assamese Muslim society becomes a model of community development for not only this region, also for rest of the world.

Design and Implementation of Solar Tracking System through PIC Controller

Ei Phyu Soe*

Department of Electrical Systems and Instrumentation, Myanmar Aerospace Engineering University, Meiktila Township, Mandalay Division, Myanmar

DOI: 10.29322/IJSRP.9.08.2019.p9248
<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9248>

Abstract- Solar energy is considered to be as a renewable energy solution for most of energy crises and environmental pollutions. Sun always moves from east to west direction independent of weather condition. So with this concept, movement of the solar panel without using sensors is done with the help of programme loaded into the microcontroller. Solar tracking enables more energy to be generated because the solar panel is able to maintain a perpendicular profile to the sun's rays. As such, it is vital that those in engineering fields understand the technologies associated with this area. This thesis describes the design and implementation of solar panel tracking system by using PIC microcontrollers. These solar tracking systems are controlled using PIC16F887 Microcontroller for vertical axis and PIC16F84A Microcontroller for horizontal axis. Two stepper motors (NEMA17) is mounted to control the vertical axis and horizontal axis. The project includes the design and construction of Solar Tracking Control with the associated electronic circuits. This prototype is designed for double axis to solve solstice problem. The PIC Microcontrollers are programmed using C language in microC PRO for PIC.

Index Terms- solar tracking system, PIC microcontroller, stepper motor, double axis, microC PRO.

I. INTRODUCTION

Now, many people use solar energy or photovoltaic energy as an alternative power because it is free and renewable. The sun is the central body of this planetary system; it is the star closest to the earth. Nowadays, solar energy has been widely used in the world, and it's expected to grow up in the next years. One of the most important problems facing the world today is the energy problem. This problem is resulted from the increase of demand for electrical energy and high cost of fuel. The solution was in finding another renewable energy sources such as solar energy, wind energy, potential energy etc.

Radiation from the sun can be converted into usable energy through thermodynamic processes. However, concentrating the energy from the sun can be difficult because the incident radiation that reaches Earth is spread out over a large area. Moreover; the solar panel that many of the users use is only in one way direction. If the sun located at the direction that is not perpendicular to the solar panel, the power that can be generate is low when comparing to the sun located exactly perpendicular to the solar panel. The sun rotates from east to west during a day, from north to south over a year but the highest power that can be generate by the solar panel when the solar panel is perpendicular to location of the sun.

Therefore, it is needed to rotate the solar panel in order to follow the sun's direction. Tracking systems try to collect the largest amount of solar radiation and convert it into usable form of electrical energy (DC voltage) and store this energy into batteries for different types of applications. The sun tracking systems can collect more energy than a fixed panel system collects.

II. HARDWARE AND SOFTWARE USED IN SOLAR TRACKING SYSTEM

Solar Tracking System

The solar tracker that designed is a two axis tracker, which will track the sun on both horizontal and vertical axis. This is achieved by building a prototype that consisted of many individual parts. Some of the key hardware that used is

- 1) Stepper motors
- 2) PIC 16F microcontrollers
- 3) Driver circuit (L298N)
- 4) 7-segment display

In order to make the system completely, all these hardware had to be linked together.

1) Stepper Motor

Stepper motors are commonly used for precision positioning control applications. All stepper motors possess five common characteristics which make them ideal for this application. Namely, they are brushless, load independent; have open loop positioning capability, good holding torque, and excellent response characteristics.

Figure 1 Stepper motor

A bipolar stepper motor was selected because of the precision it offers in positioning applications. Additionally, although full bridge circuit is needed the bipolar offers higher torque than unipolar type. The motor (NEMA 17) specifically used in the project was a 12 volt, 1.8 degree-per-step, 2 phase, and bipolar motor. It was decided to half-step the motor in order to

provide greater positioning accuracy. This results in 0.9 degrees-per-step. NEMA 17 stepper motor is shown Figure 2.

Figure 2 NEMA 17 stepper motor

2) PIC16F887 Microcontroller

PIC 16F887A is one of the most commonly used microcontrollers especially in automotive, industrial appliances and consumer applications. PIC16F887 is at the upper end of the mid-range series of the microcontrollers developed by microchip Inc. It can be reprogrammed and erased up to 10,000 times. Therefore it is very good for new product development phase. There are 40 pins on PIC 16F887. Most of them can be used as an I/O pin.

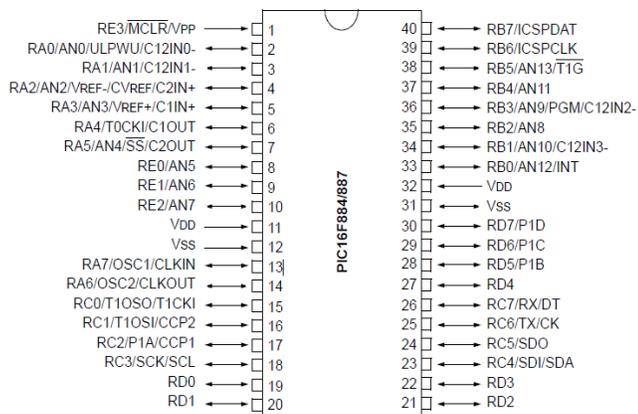

Figure 3 Pin Diagram

3) Motor Drive Circuit

The Motor Shield is based on the L298, which is a dual full-bridge driver designed to drive inductive loads such as relays, solenoids, DC and stepping motors. It can drive two DC motors, controlling the speed and direction of each one independently. All inputs are TTL compatible. Each output is a complete totem-pole drive circuit with a Darlington transistor sink and a pseudo Darlington source. Two enable inputs are provided to enable or disable the device independently of the input signals. The driver has some features such as wide supply voltage range 4V to 35V, separate input logic supply, thermal shutdown, high noise immunity inputs, and output current 2A per

channel, peak output current 4A per channel and output clamp diodes for inductive transient suppression.

L298N driver uses four input pins and two enable pins to configure the operation of a stepper motor. Digital output pin of PIC microcontroller are wired to four input pin of the driver to control the direction of the motor. Two enable pins are connected to the supply pin of the microcontrollers.

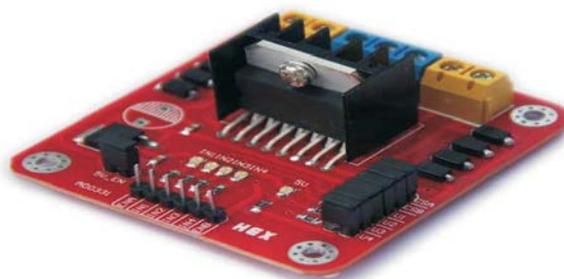

Figure 4 Motor Driver Circuit

4) 7-Segment Display

There are two types of 7-segment display: common anode (CA) and common cathode (CC). Basically the display consists of seven segments of LEDs connected either as common anode or common cathode. In a common anode display the anodes of all the LED segments are connected together and the signals are sent to the individual cathode segments as shown in Figure 5. Similarly, all the cathodes are connected together in a common cathode display and the signals are sent to the individual anode segments. Table 1. shows the segments that should be turned on to generate the decimal numbers 0 to 9.

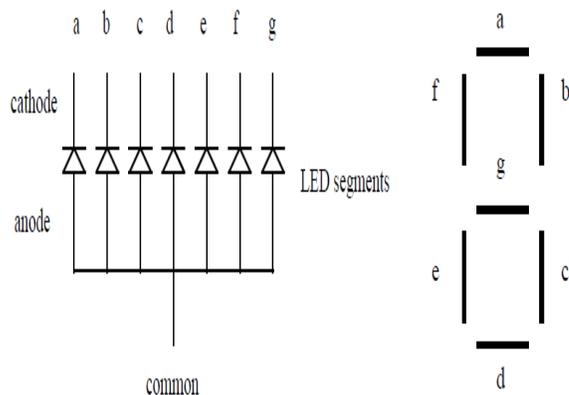

Figure 5 The signals are sent to the individual cathode segments

In this system four common anode 7-segment LEDs are used to display time. The program is written to count up seconds, minutes and hours and display the data on the 7-segment display.

Table 1 The segments are turned on to generate the decimal numbers 0 to 9

Number	g	f	e	d	c	b	a
0	0	1	1	1	1	1	1
1	0	0	0	0	1	1	0
2	1	0	1	1	0	1	1
3	1	0	0	1	1	1	1
4	1	1	0	0	1	1	0
5	1	1	0	1	1	0	1
6	1	1	1	1	1	0	0
7	0	0	0	0	1	1	1
8	1	1	1	1	1	1	1
9	1	1	0	0	1	1	1

III. CONSTRUCTION OF TWO AXIS SOLAR TRACKING SYSTEM

In order to make the automatic solar tracker, all the components are linked together to track the sun. It was very important to design the system carefully so that slightest movement of the sun can be tracked. The two complete circuits used to track the sun are Figure 7 and Figure 8. One of the microcontrollers is responsible for tracking the sun on each of the two axes. In the circuit, timer of PIC microcontroller is used and for seasonal changes push-button switch is also utilized in controller of horizontal axis for tilting solar panel by manually. Without using sensor, movement of solar panel is done with the timer of PIC.

When reaching specific time, microcontrollers control the movement of stepper motor. As each stepper motor has 4 electromagnets so 4 pulses are required from the microcontroller for each of the stepper motors. Since the stepper motors have high current rating so the pulse generated by the PIC 16F microcontroller is not sufficient to drive the stepper motors.

So, to amplify the current output from the microcontroller L298N module driver is used. As the pulse is given in sequence from the microcontroller so the stepper motors receive the pulse accordingly telling them which way to move and how many steps to move. This mechanism allows the whole system to continuously track the sun throughout the whole day.

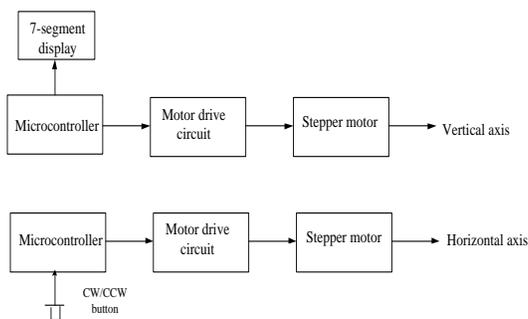

Figure 6 Hardware Block Diagram

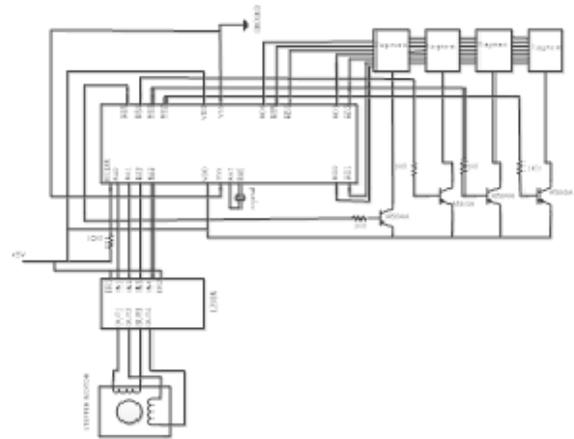

Figure 7 Hardware Circuit Diagram of Vertical Axis

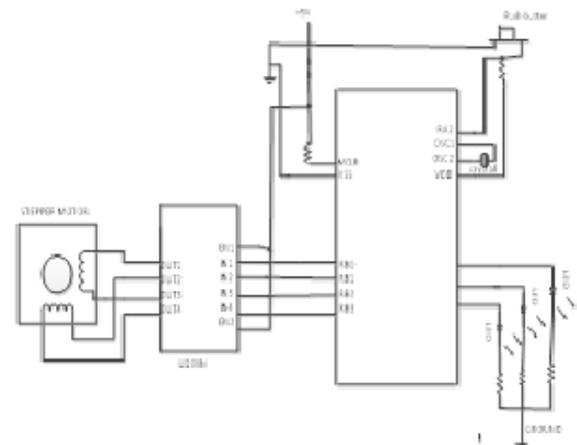

Figure 8 Hardware Circuit Diagram of Horizontal Axis

IV. TEST AND RESULT

A. Overall Circuit Diagrams of Solar Tracking System

In simulation circuit diagram, four 7-segment LED displays connected to PORTC of PIC microcontroller, enable pins of digits (1 to 4) are connected to PORTD. And PORTA pins of microcontroller generate pulses to input pins of motor driver. The controller is operated from a 4MHz resonator. In this program, timer module of microcontroller is used to get seconds, minutes and hours so that 7-segments display time. The stepper motor rotates the required direction at the specific time.

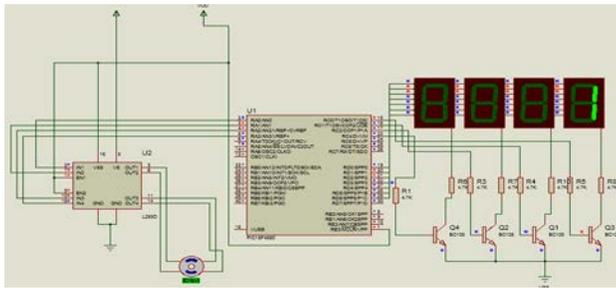

Figure 9 Simulation circuit diagram of solar tracking system for vertical axis

For giving pulses PORTB pins of PIC 16F84A are connected to input pins of L298N motor driver and are also connected LEDs. When running the motor, LEDs also emit light. If a push-button switch connected RA2 is pressed, the motor changes in the direction.

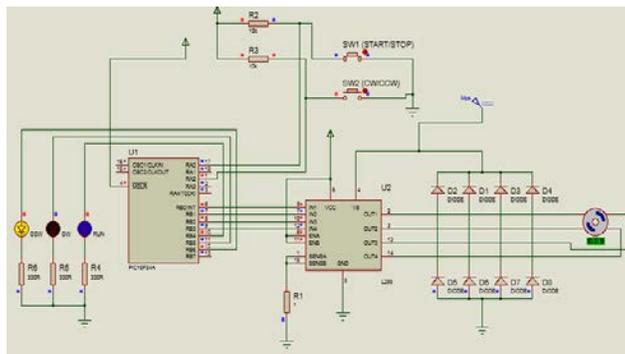

Figure 10 Simulation circuit diagram of solar tracking system for horizontal axis

B. Controller Circuits

The sample arrangement of controller circuit on project board is shown in figure. Four 7-segments display minutes and seconds. The right two display seconds and others are for minutes. When it reaches at 10minutes, PIC output pins will transmit output signals.

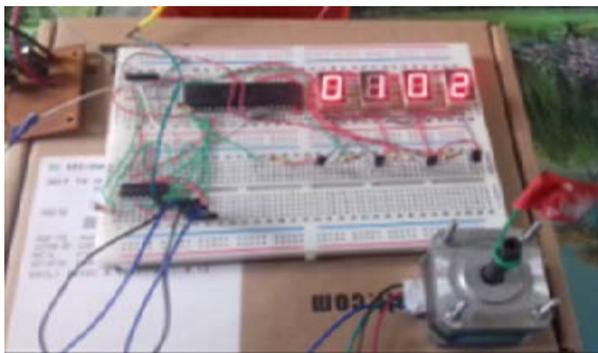

Figure 11 Testing controller circuit (PIC16F887)

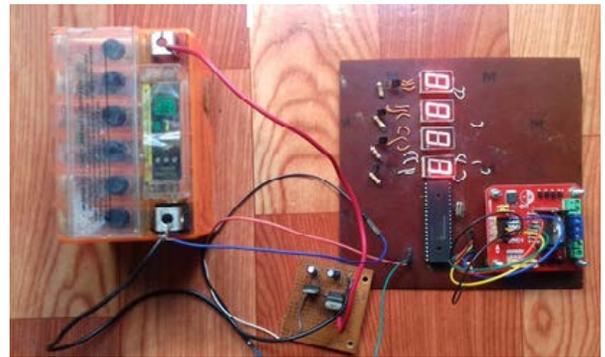

Figure 12 Testing controller circuit (PIC16F887)

The following figure is controlling circuit of PIC16F84A for horizontal axis. In this circuit, switch is utilized to control the clockwise / counterclockwise direction of the motor. Three LEDs also include to display condition (CW /CCW).

2:00 PM	12.56	1.38	17.332	11.21	1.24	13.901
3:00 PM	12.07	1.33	16.053	10.33	1.14	11.776
4:00 PM	11.82	1.31	15.484	9.73	1.08	10.508

Table 2 shows the data of voltage, current and power received from solar tracking system and static solar panel for a day.

V. CONCLUSION

This paper has presented a means of tracking the sun's position with the help of microcontroller. Specially, it demonstrates a working software solution for maximizing solar cell output by positioning a solar panel at the point of maximum light intensity. Built in timer of PIC is used in this system so that it responds more accurately. Even in a cloudy day when intensity of sun light may vary at different time of a day, the timer can be more that handy to drive solar panel correctly in that low light. So the prototype represents a method for tracking the sun both in normal and weather condition. Moreover, the tracker can initialize the starting position itself which reduce the need of any more photo resistors. To solve summer solstice and winter solstice the solar panel is titled manually with the help of switch. The PIC microcontrollers are programmed using C language in microC PRO PIC. So C language has been studied in detail. In addition; the design of mechanical structure and electrical circuit has been understood.

ABSTRACT: Increase in population around the globe today has brought about significant increase in the amount of waste generated. In other words, detection, monitoring and management of waste have become a challenge in developing countries. Due to the indiscriminate disposal of solid waste at dump sites and the environmental pollution posed by this activity, this paper proffers a solution to tackle this menace. The solution adopts an innovative approach by the application of Internet of Things (IoT) to implement a smart refuse (garbage) monitoring system. This application will tackle challenges of untimely and inefficient waste management by designated agencies. To achieve this work, ultrasonic sensors were used to detect instantaneous level of waste in trash bin at various dump sites. These sensors give feedback via a Wi-Fi module to the web application of the waste management authorities for consistent monitoring thereby curbing the over flow of refuse dumps at sites. A significant contribution in this work involves the use of an interlock mechanism that will not allow further dumping of waste once the trash bin is full. Implementing this application using a Wi-Fi module is cost effective, readily accessible, reliable and an efficient approach. This system when implemented will ensure a cleaner and healthier environment with human computer interface communication system.

Keywords: Internet of things, wireless network, sensors, microcontrollers.

I INTRODUCTION

Due to the rate of population growth, garbage management has become a global issue. Inadequate and untimely information on the conditions and state of dump sites has led to the menace of overflowing garbage bins located at strategic positions (Kanchan and Chitode 2014). This poor situation ought to be alleviated by the government and concerned authorities by implementing viable and feasible methods to overcome this challenges. This work therefore explores options, strategies, and practical way to tackle this issue.

Internet and its applications have become a fundamental and essential part of everyday life. Due to the tremendous demand in innovative ideas, researchers have gone beyond connecting just computers into the web. Internet communication over the years has widely grown from user-to-user interaction to device-to-device interactions. The IoT concepts were proposed few years back but can be applied to provide an effective and reliable platform for smart garbage management system. Some of the commonly used methods were implemented using sensors and microcontrollers. The details of each bin are monitored by the waste management authority with the help of Graphic user Interface (GUI). The implementation of smart garbage management system using sensors, microcontrollers and WI-FI module ensures waste bins are clean as soon as the garbage level reaches its maximum. If the dustbin is not cleaned in specific time, then the details is sent to the higher authority to take appropriate action against the designated contractor. This system also helps to monitor falsified reports about the condition of dump sites and reduce incessant trips by garbage collection vehicles. Implementing this scheme will help to reduce cost of waste collection and ultimately help to maintain a healthy and clean environment.

II REVIEW OF RELATED WORKS

Vikrant et al, Narayan et al and Sinha et al 2015 proposed a smart garbage management system for smart cities. In the work, the level of garbage is detected with ultrasonic sensors and communicated to the authorized control room using a GSM module. A GUI was also developed to monitor the desired information related to the garbage for different selected locations. A major drawback of this system lies on the fact that it was powered with DC supply only, requiring recharging of batteries on a timely basis.

In Navghane et al 2016, a dustbin was interfaced with microcontroller based system having IR wireless systems along with central system showing current status of garbage. This was actualized on mobile web browser with html page by Wi-Fi, Such that the information on the status of the bin will be updated on to the html page using a Wi-Fi module. But weight sensors were used to detect the amount of garbage rather the level of garbage in dustbin. Such information can be misleading as the weight may at times not imply that the waste in the bin has reached full capacity.

Shaficul et al 2012 provided an overview on solid waste monitoring system. Guerrero et al 2014 presented an extensive survey on the challenges associated with collection and control of waste in developing countries between 2005 to 2011. The models in the survey were tested on real time data. The outcome presented systemic approach for solid waste collection in developing countries. Although IoT based approaches were not considered at this time. But advanced scheduling and routing via exploiting modern ICT algorithms were considered. In Alexey et al 2014, a novel cloud based system was presented for data sharing and dynamic route optimization for waste management in inaccessible areas. The goal was to provide software as a service (SaaS) for customers and develop a beneficial communication between all stakeholders in the waste management system.

In Meghana and Nataraj 2015, a multipurpose infrared sensor was used to detect the level of garbage in a dump site. The sensors sense and carry signals which are distinguished by their connector names. The GUI gives the output level of the garbage, location, date and time the bin got filled. A major drawback of this system is that the latter does not ensure whether garbage is cleaned up or not.

In Mustafa and Ku Azir 2017, an IoT device which uses yet an arm controller together with ultrasonic sensors to detect the level of garbage was implemented. In Alice et al, the weight and toxic condition of the waste inside the bin was used to ascertain if the bin is due for discard by the concerned agencies. In Asima and Sumanth 2017, Zig bee approach was sought to implement the transfer of information of the bin through a mesh network. This approach suffered the limitation of low data rate applications however, Information concerning the status of the bin can be obtained anywhere in real time. In Akash et al, apart from the monitoring and detecting features of the garbage bin, additional feature like fire sensors was added to the device to detect fire outburst as a result of waste reaction within the bin. This work is therefore geared towards solving the problem of spillage of waste in refuse dump by adopting an interlock mechanism that will prevent further dump of refuse in the dumpsite as well as giving information to the relevant authorities on the condition of the site.

III METHODOLOGY

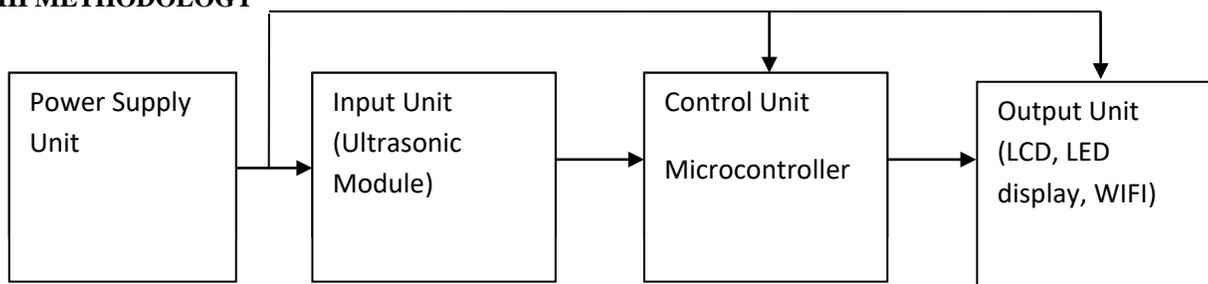

Figure 1: Block Diagram of the circuit component of the IoT based garbage monitoring system.

The circuit is divided into four sections; each section performs a specific task. The block diagram in figure 1 shows the basic parts of the circuit components.

The input unit is made of the ultrasonic module with the control unit made up of the ATMEGA328 controller. The controller has a memory space of 2 kilobyte RAM and 32 kilobyte ROM. The controller uses operating voltage of 5-volt dc. The output unit is made up of the light emitting diode, the liquid crystal display and the WIFI module (ESP8266).

The input unit consists of two HC-SR04 ultrasonic (sensor) modules which fetches the depth of the container (trash bin). It is a four terminal device with pins: Vcc, Gnd, Echo and trigger. The Vcc and the Gnd pin-outs are connected to the 5V and the Gnd of the voltage regulator respectively. The ultrasonic sensor uses the two fundamental pins: Trigger and Echo, which are used for calculating the level of the waste in the bin by generating sound waves and thus calculating the time duration of the echo. The Ultrasonic Sensor sends out a high-frequency sound pulse and then determines how long it takes for the echo of the sound to reflect. The sensor has 2 openings on its front. One opening transmits ultrasonic waves, (like a tiny speaker), the other receives them, (like a tiny microphone).The ultrasonic sensor uses this information along with the time difference between sending and receiving the sound pulse to determine the distance to an object.

The trigger pin is used to send a sound wave; this is triggered by sending a 10 μ s signal to the trigger terminal from the unit. The sound is reflected from the intruder body. The depth of the trash bin from the device is measured by the duration of the signal times the velocity of sound wave. The duration of high level as received by the control unit is at the echo terminal connected to the control unit.

The ARDUINO ATMEGA328 microcontroller gets information from sensors and processes it. The microcontroller further compares the received data with the threshold level set to generate the required output The Atmega328 microcontroller pin-outs are connected to the ultrasonic module, the led indicator, ESP8266 and the liquid crystal display. It receives signal from the input unit and sends it to the output unit. The sensor signal is sent to the control unit where calibration is done and the information displayed on the LCD. Pin 2 to 4 of the controller (U4) is connected to the ultrasonic module, the ultrasonic module measures the depth of the container and sends the signal to the microcontroller, the program written is used in calibrating the depth of the container. The controller sends data to the LCD to display the depth of the trash can for the user. The user is able to communicate with the device using the LCD to visualize and the system. The LED indicator is also calibrated to display the level of dirt in the container.

The Atmega328 has an on-chip oscillator that requires an external clock to run it. Therefore, a quartz crystal oscillator (X1) is connected to pin 9 and pin 10 of the Atmega328 controller (U5). The crystal is used to control the processing speed of the microcontroller. The speed of the microcontroller refers to the maximum oscillator frequency connected to the crystal pins. The ESP8266 module is connected to the pin 15 and 16 of the control unit. The microcontroller communicates with the ESP8266 via the use of its serial port. The microcontroller and the WIFI (ESP8266) module communicate with the baud rate of transmission (9600 bits per second).

The output unit consist the LCD, LED indicator and the WIFI module (ESP8266).The WI-FI modem has a powerful on-board processing ability with storage capability that allows it to be integrated with the sensors and other devices. The ESP8266 has self-calibrated Radio frequency which allows it function effectively under all operating conditions. The WIFI module is used to transfer the data (level of dirt in the trash bin) to a web app, to notify the authorities in charge of cleaning the dirt, about the level of dirt in the bin. The LED indicator is arrayed in four steps, step 1; indicates that the trash can is empty, step 2; indicates the trash can is 25 percent full, step 3; indicates the trash can is 50 percent full and step 4 is used to indicate that the trash can is completely filled.

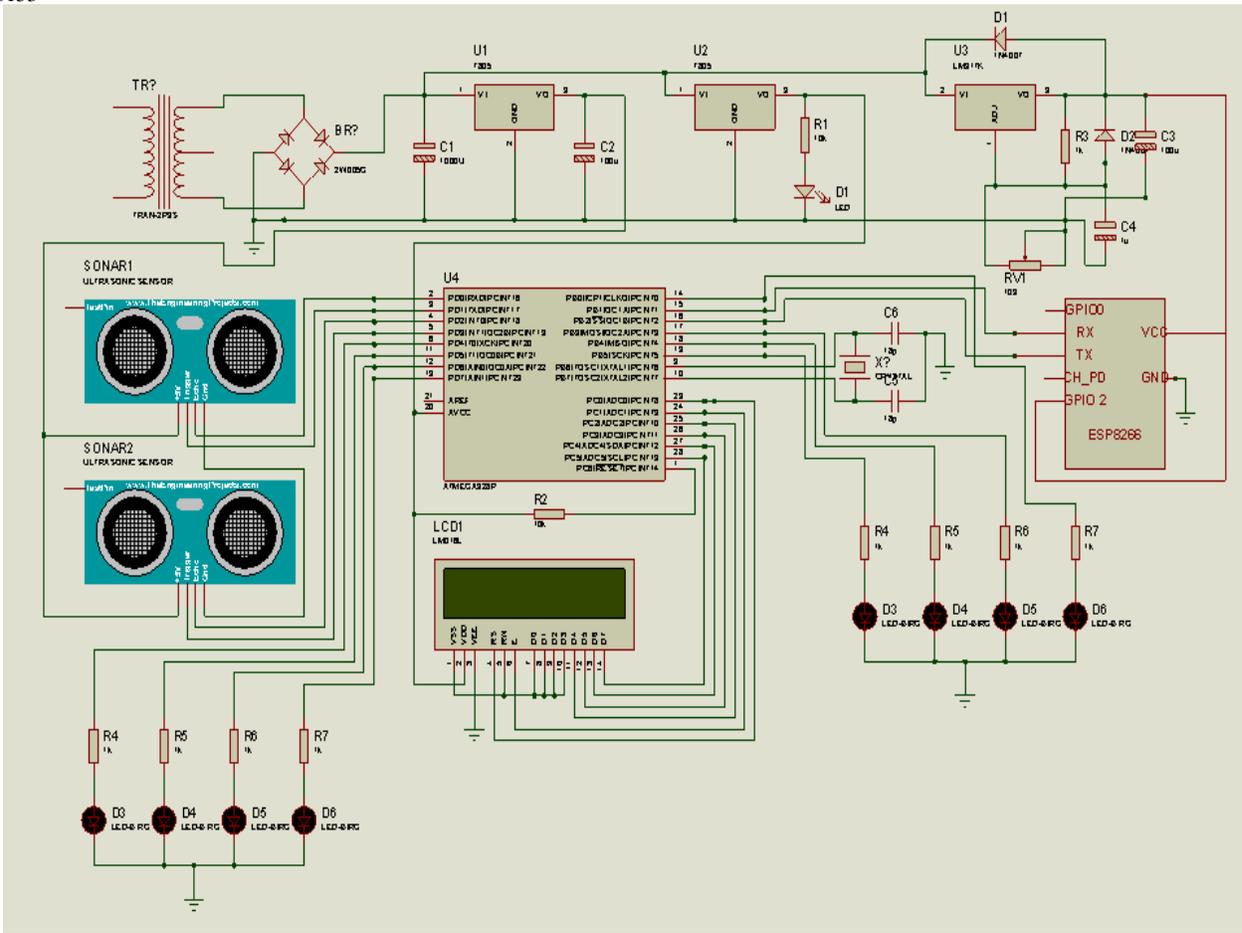

Figure 2: Circuit diagram of the IoT based garbage monitoring system

SYSTEM ALGORITHM

- Step 1: Start Process.
- Step 2: Initialize the System
- Step 3: Check for the level of dirty in trash can.
- Step 4: Check if level of trash can is empty, 25%, 50%, or full
- Step 5: If step 3 is untrue go back to step 2
- Step 6: Else Display level on the 16*2 LCD display.

Step 7: Send the level of Trash to web page.

Step 8: Repeat process by going to step 3.

Step 9: Stop process.

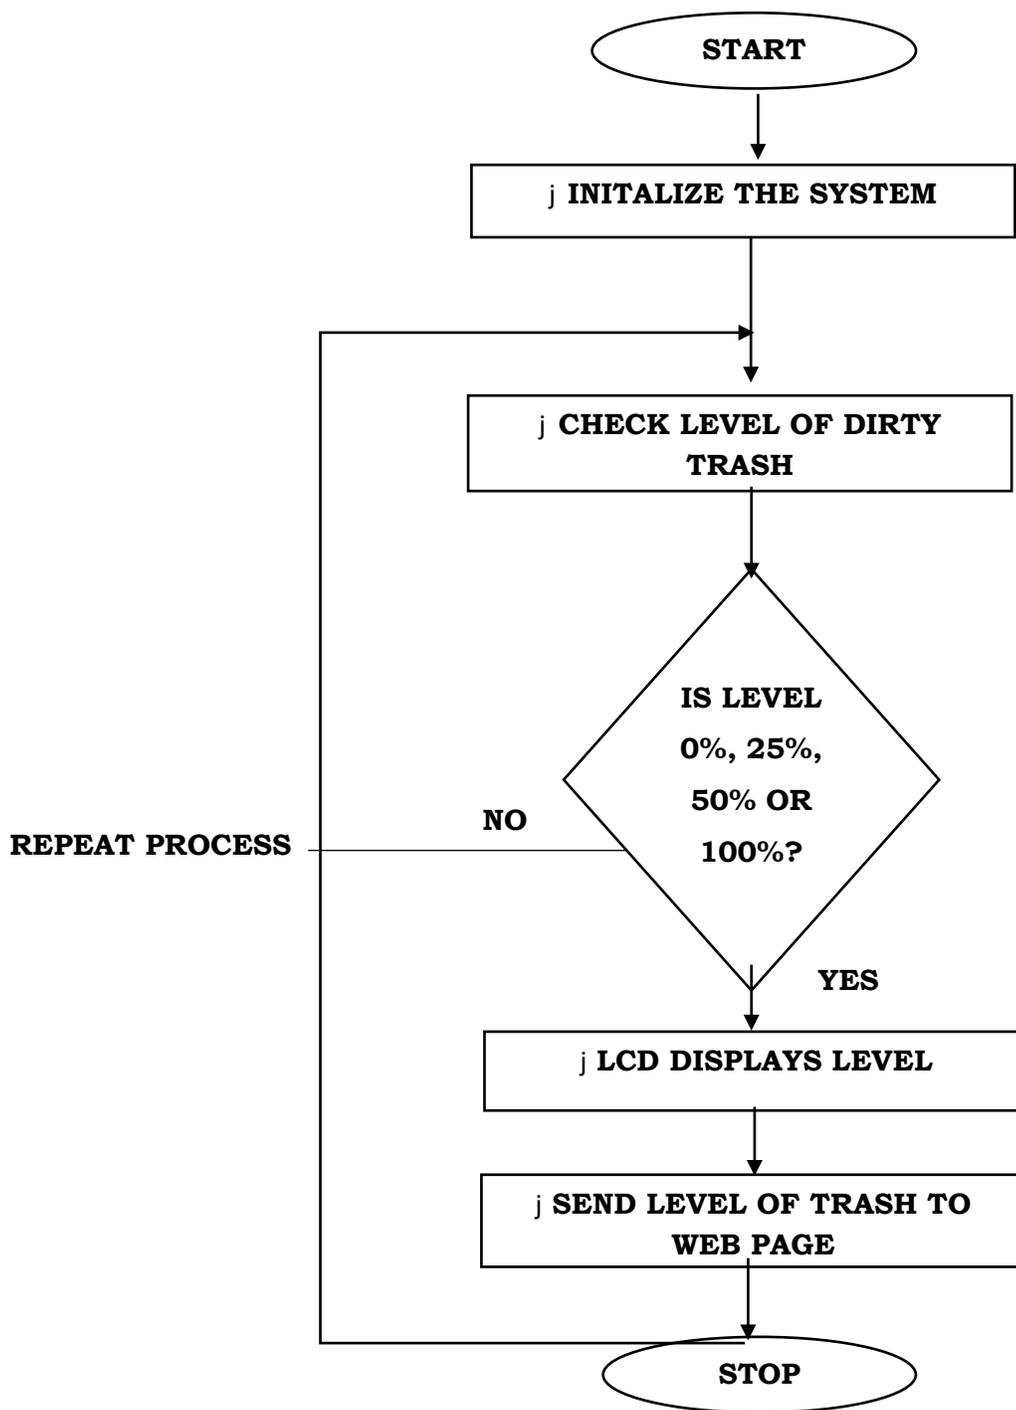

Figure 3: Flow chart showing the step-wise operation of the IoT based refuse system

IV RESULTS/DISCUSSION

Some part of the circuit diagram was simulated in the integrated environment called Proteus version 8.6 Professional. This was done to ascertain the fact that the circuit is realizable. The ultrasonic sensor senses and receives the signal which is displayed on the LCD including the garbage level indication on the bin.

Table 1: Signal Voltage during Reception, indicating the bin capacity and the corresponding display level.

Garbage bin	Action
Container is empty	Liquid crystal display shows Level 1.
Container is 25% full	Display shows Level 2.
Container is 50% full	Display shows Level 3
Container 100% full	Display shows Level 4.

Table 2: Results obtained on testing the Circuit

Process	Component	Action
Power is supplied to the circuit	Power indicator LED and program indicator LED	Both LEDs turn on
RF signal is sent out from the sensor to ascertain level of dirt in the bin	Level 1 (Container) empty	Liquid crystal display shows Level 1. Sends the information to web app
RF signal is sent out from the sensor for another specific level	Level 2 (Container 25% full)	Display shows Level 2. Sends the information to web app
RF signal is sent from the sensor for a half full level	Level 3 (Container 50% full)	Display shows Level 3. Sends the information to web app
RF Signal is sent from the sensor for maximum level	(Container 100% full)	Display shows Level 4. Sends the information to web app and prevent further dump.

5.0 CONCLUSION

The design and implementation of the ARDUINO based internet of things (IoT) Refuse monitoring system was achieved and its performance met expectation. The circuit was able to detect the level of garbage and transmit information concerning the state of the system using WIFI module to a web app. The liquid crystal display helped to visualize the state of the system. The state and condition of the site can be viewed on the web app from any internet enabled device.

The system when implemented will prevent environmental pollution. Other advantages of the system include the fact that; it involves full automation and requires less human intervention in its operation.

The Impact of Advertisement and Sales Promotion towards the Consumer's Decision to Use OVO Application in Palembang, Indonesia

Triana Sukeci, Zakaria Wahab, Ahmad Widad

Magister Management, Sriwijaya University, Indonesia

DOI: 10.29322/IJSRP.9.08.2019.p9250

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9250>

Abstract- The objective of this research was to analyzing the influence of advertising and sales promotions on consumer's decision to use OVO application in Palembang City. The analysis used a Multiple Linear Regression by using Verse 23 of SPSS to calculate the data. The data was collected by filling out an online questionnaire for one hundred respondents. The results of this study indicated that advertising and sales promotions had a positively and significantly influenced on consumer's decision.

Index Terms- advertise, sales promotion, customer decision.

I. INTRODUCTION

The enhancement of the technology nowadays, it is not only impacted to the education, social, and politic sectors, but also to the finance sector. It is marked by the trade development of financial technology. Financial Technology is becoming a hot topic recently because it is a new thing in business and it can give a great chance in the financial industry.

PT. Visionet International as a digital payment company which belongs to Lippo Company is one of Fintech from Indonesia that facilitates payment through the application. A launched Smart Financial Application is OVO, this application tries to facilitate every needs related with cashless and mobile payment. OVO Application is now available for Android smartphone platform and iOS. OVO has been joined into 200 cities and more than 400 malls in Indonesia. Quoted from www.cnnindonesia.com (2018) page, the rate of OVO's growth in Indonesia in 2018 has reached more than 10 million users that comes from transportation, retail, and e-commerce. This company claims that it has had more than 500.000 offline tenants in 2017 that uses OVO as a payment method.

In early 2018, Telkom Group Company names MDI Ventures together with Mandiri Securities makes a report about the growth of mobile payment service. From their point of view, the business value of mobile payment in Indonesia is predicted reached in rate Rp. 459 billion in 2020. Based on www.cnbcindonesia.com (2018), in the last two years, OVO and GoPay get the top rank of digital payment tools in Indonesia. According to Fintech report in 2018 which is held by Daily Social and OJK as mentioned from 1.419 respondents, 79,4% uses GoPay. Whereas, 58,4% uses OVO and 55,5% respondents use T-Cash from Telkomsel.

Seeing the phenomenon of the development of payment instruments and the achievement of OVO in two years operating as a startup and not many studies that discuss mobile payment in Indonesia made me interested in conducting research that discusses the influence of advertising and sales promotions that influence consumer's decisions to use OVO applications.

II. LITERATURE REVIEW

Advertisement

Based on Bearden and Ingram (2007: 393), advertisement is a persuasive marketing communication element, non-personal, paid by sponsor and spread through mass communication to promote the use of product, or service. Then, according to Gitosudarmo (2008 : 228), advertisement is a main tool for the company to influence their consumer. This advertisement could be done by entrepreneur through newspaper, radio, magazine, television, or even posters that are showed in the roadside or strategic places.

H1: There is an impact of advertisement significantly-influenced towards the consumer's decision to use OVO application in Palembang.

Sales Promotion

Based on Kotler (2005:298), sales promotion is "every collection of incentive tool, which is most of the short period of time, which is programmed to stimulate the purchase of the certain product or service faster and bigger by consumer and seller". Whereas, sales promotion according to Utami (2008:134) is "a short period of time encouragement to buy or sell a product or service.

H2: There is an impact of sales promotion significantly-influenced towards the consumer's decision to use OVO application in Palembang.

Consumer's Decision

Purchasing decision based on Schiffman and Kanuk (2007), Is "the selection of an option from two or alternative choice" could be translated as purchasing decision is the one's decision to choose one of several availability choices. On the other hand, the availability of choices which were more than one was a must in taking the decision. Sweeney (2008), said that the indicator of purchasing decision is to buy or not buy related with

the conviction in purchasing and would not expect any problem where it was found a hope that was not getting any trouble or risk.

III. CONCEPTUAL FRAMEWORK

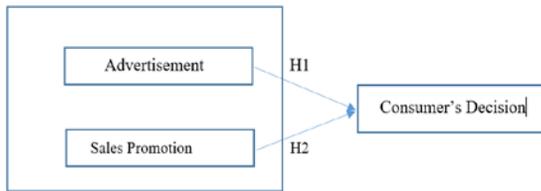

Fig-1 Conceptual Framework

IV. RESEARCH METHODOLOGY

Technic of data collection was using online questionnaire which was collected from more than 100 respondents who have used OVO Application and located in Palembang. The online questionnaire was divided into three sections. Firstly, filtering the respondents based on the above requirements. Secondly, collecting the respondents' identity. At last, collecting the idea of respondents about independent variable (advertisement and sales promotion) and dependent variable (consumer decision). Every question is valued in the Likert's scale of 6 points. The data was analyzed through the multiple linear regression by using verse 23 of SPSS.

V. RESULT

Validity Test

Based on the above instrument validity test table research, it could be seen that the rvalue on the table is having a bigger value than the rtable. It is 0,3610.

Table-1 Validity Test Result

Variable	State ment	r _{table}	R _{test}	Result
Advertisement(X ₁)	1	0,3610	0,618	Valid
	2	0,3610	0,711	Valid
	3	0,3610	0,728	Valid
	4	0,3610	0,588	Valid
Sales Promotion(X ₂)	1	0,3610	0,843	Valid
	2	0,3610	0,782	Valid
	3	0,3610	0,805	Valid
	4	0,3610	0,823	Valid
Consumer's Decision(Y)	1	0,3610	0,788	Valid
	2	0,3610	0,779	Valid
	3	0,3610	0,728	Valid
	4	0,3610	0,757	Valid

5 0,3610 0,781 Valid

Table.1 shows that all r_{tests} are bigger than r_{table}. It means that all indicators are valid as research instrument.

Reliability Test

The instruments are declared reliable if the Cronbach's Alpha value is bigger than 0,6.

Table-2 Reliability Test Result

Variable	Cronbach's Alpha	Criteria	Result
Advertisement (X ₁)	0,855	0,6	Reliable
Sales Promotion (X ₂)	0,963	0,6	Reliable
Consumer's Decision (Y)	0,902	0,6	Reliable

Alpha is bigger than 0,6. It means that all variable indicators are reliable.

Respondent's Overview

The Information which is collected by gender, respondents' age, education, and profession.

Table-3 Respondent's Distribution Identity

Age	Frequency	%
17 - 20 Years	6	6
21 - 30 Years	63	63
31 - 40 Years	27	27
41 - 50 Years	4	4
Total	100	100

Gender	Frequency	(%)
Male	53	53
Female	47	47
Total	100	100

Education	Frequency	(%)
Junior High School	1	1
Senior High School	15	15
Diploma	13	13
Bachelor	69	69
Graduate	2	2
Total	100	100

Profession	Frequency	(%)
Student	10	10
Entrepreneur	11	11
Civil		
Servant/TNI/Police Officer	7	7
BUMN Employee	10	10
Private Employee	55	55
Housewives	7	7
Total	100	100

Multiple linear regression is used to explain the relation among variables that were tested. The regression equation can be seen as following:

$$Y = 4,432 + 0,402X_1 + 0,625X_2$$

The equation can be detailed as below:

- The constant (α) is 4,432, it shows that if the variables of advertisement and sales promotion are 0, then the consumer's decision is 4,432.
- The coefficient of regression (β) advertisement is 0,402, it shows by adding one unit of advertisement, then it would be increased consumer's decision of 0,402.
- Regression coefficient (β) sales promotion is 0,625, it shows that by adding one unit of sales promotion, then it would be increased consumer's decision of 0,625.

Multiple Linear Regression Analysis

F-Test (Simultaneous)

Table-4 ANNOVA Output
ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	749.861	2	374.931	88.719	.000 ^b
	Residual	409.929	97	4.226		
	Total	1159.790	99			

a. Dependent Variable: Consumer's Decision

b. Predictors: (Constant), Advertisement, Sales Promotion

According to Table-4, it could be seen that sig was $< 0,05$ concluded that advertisement and sales promotion had (0,000 $< 0,05$). It meant that H_a was accepted. Then, it could be significantly effected on consumer's decision.

t-Test (Partial)

Table-5 Coefficients Output

Variable	Coefficients ^a			t	Sig.
	Unstandardized Coefficients		Standardized Coefficients		
	B	Std. Error	Beta		
(Constant)	4.432	1.530		2.896	.005
Advertisement	.402	.080	.344	5.048	.000
Sales Promotion	.625	.073	.585	8.597	.000

a. Dependent Variable: CONSUMER'S DECISION

According to Table-5, it was described as following:

- The Sig of X_1 0,000 $< 0,05$. It meant that H_a was accepted and H_0 was rejected. Then, it could be summarized that advertisement has partially significance effected on consumer's decision.
- The Sig of X_2 0,000 $< 0,05$. It meant that H_a was accepted and H_0 was rejected. Then, it could be summarized that sales promotion has partially significance effected on consumer's decision.

Coefficient Determination

Table-6 Model Summary Output

Model Summary^b					
Model	R	R Square	Adjusted Square	R	Std. Error of the Estimate
1	,804 ^a	,647	,639		205,574

a. Predictors: (Constant), ADVERTISEMENT, SALES PROMOTION

b. Dependent Variable: CONSUMER'S DECISION

According to Table-6, it could be seen that R^2 was 0,639 and equal to 63,9%. It meant that the advertisement and sales promotion had significantly effected on consumer's decision was 63,9%. And the rest, 36,1%, was affected by other variables which was not included in this research.

VI. DISCUSSION

The advertisement has a significance $0,000 < 0,05$ and regression coefficient is 0,402. Thus, advertisement has positively and significantly effected on consumer's decision. According to the research of Mohammad Pambudi Ary Wicaksono and Ni Ketut Seminari (2016), it shows that the advertisement has a significantly effected on consumer's decision.

Sales promotion has significance $0,000 < 0,05$ and regression coefficient is 0,625. Thus, sales promotion has positively and significantly effected on consumer's decision. Elisa dan Yurnizal Firdaus (2015) and Priccila Natalia dan Mumuh Mulyana (2010). Their research show that there are positive relationship between sales promotion and consumer's decision. The higher sales promotion, the higher consumer's decision.

VII. CONCLUSION

Based on the above result and discussion, it can be concluded as following:

1. Advertisement has positively and significantly effected on consumer's decision to use OVO application in Palembang, Indonesia.
2. Sales promotion has positively and significantly effected on consumer's decision to use OVO application in Palembang, Indonesia.

VIII. RECOMMENDATION

Based on above result and discussion, the recommendations are given as following:

For company

1. PT. Visionet International is suggested to improve the quality of OVO advertisement on social media, such as : youtube, twitter, and Instagram to embed the image of the company in consumer's mind

2. PT. Visionet International is suggested to give an interesting sales promotion to the OVO customers.

For further researcher

Based on the conducted research, the influence of advertisement and sales promotion towards the consumer's decision to use OVO application in Palembang city was 63,9%, whereas the rest of 36,1% was influenced by another variable which was not researched in this research. Therefore, it is hoped to the next researcher could add another variable which was not analyzed in this research, like marketing mix strategy, satisfaction, and the attitude of OVO service application users.

The Influence of Wedoro Village's Local Wisdom Based Learning on Elementary Students' Creative Thinking Abilities

Lutfi Mushonif Elghufri, Suryanti, Widowati Budijastuti

Primary Education, Postgraduate, Surabaya State University

DOI: 10.29322/IJSRP.9.08.2019.p9251

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9251>

Abstract : This study aims to determine the effect of learning by using a scientific wisdom-based local approach to making sponge slippers in Wedoro village towards creative thinking skills in 4 elementary schools . Subjects of this study was Grade 4 MINU Tropodo Waru Sidoarjo as many as 28 students to design *one group pretest-posttest* . Methods of collecting data using observation sheets of student activities during the learning process and thinking skills test . Data analysis techniques use if quantitative descriptive . The result showed that the method of scientific approach using local wisdom in the form of the manufacture of slippers in the village Wedoro District of Waru Sidoarjo to increase creative thinking skills showed high category and students activity give positive response with good category to learning. The results of the study found that learning using a scientific wisdom-based approach to making Wedoro village sandals on material of various styles and their benefits is appropriate to be used to improve students' creative thinking skills.

Index Terms - Local Wisdom , Creative Skills , Scientific Approach .

I. INTRODUCTION

Learning with a scientific approach is learning that emphasizes the discovery of something with the process through scientific steps. The 2013 curriculum that emphasizes the learning system must contain substantive learning experiences, such as: observing, asking questions, gathering information, associating, and communicating (BSNP, 2013). The science learning model is a learning model using stages such as: (A) Obtaining information through empirical methods, (B) Information obtained by investigations has been arranged logically and systematically and (C) Is a combination unit in the process of critical thinking that can trusted and valid (Kemdikbud, 2014)

The scientific approach or also called the scientific approach is a learning approach that emphasizes the activities of students through observing, asking, reasoning, trying and networking in learning activities in schools (Rusman, 2015). The scientific approach includes observing, asking, reasoning, trying and processing (Sudarwan, 2013). These steps are not always followed sequentially, especially in integrated thematic learning for elementary schools whose learning uses themes as a unifying of some lesson content. The scientific approach, beginning with the observation process that can be done using media images, audio, audio visual and other media such as problems. Next, ask. Students who are still sitting in elementary school are not easy to ask questions if they are not faced with interesting media. Effective teachers should be able to inspire students to improve and develop the realm of attitudes, skills and knowledge.

Basically science learning is emphasized to provide experience directly to students, to develop their competencies so that students are able to understand the natural environment. Science education is intended to investigate and take action so that it can help students get a deeper understanding of the universe. The method for studying science varies greatly, but in a wrong perspective, for example, the viewpoint of the context of students is more appropriate if it can optimize local wisdom (Azizahwati, *et al.* , 2005). The procedure for teaching science can be developed through the uniqueness and superiority of an area (Kartono, 2010). The integration of scientific material with local wisdom based on the science learning process has the opportunity for students to be able to express their thoughts, accommodate their concepts, foster creativity, create effective learning, which has implications for a more conducive learning atmosphere (Warpala, *et al.* , 2010)

Efforts to strengthen local resources as a foundation for enriching the educational space are considered important because they are based on the conclusion that the condition of the modern world and all accompanying devices are not sufficient to deliver the inhabitants of the earth to live a more valuable life. The idea in the development of education based on local resources rests on the conclusion that each group has certain ways and techniques that are developed to play a role in life in accordance with the context. Value-based education is needed to develop moral quality, personality, and togetherness that are increasingly eroded by the progress of the age (Aspin, *et al.* , 2007). As an effort to develop the value of local wisdom in education needed creative thinking skills as a provision of valuable experience for students in facing the challenges of the advancement of science and technology that continues to grow rapidly.

Education based on local power or local wisdom is education by utilizing local excellence as a source of development of student competence in aspects of culture, economy, information technology, communication, language, ecology and others that support the learning process in Asmani elementary school (2012). While the local power of an area can be in the form of crops, artistic creations, traditions, culture, services, human resources, natural resources and various other types. The advantages of local power possessed by an area can be utilized by educators to foster learning skills in schools so that they can increase knowledge about the potential of the region .

Creativity as a demand for the 21st century will continue to be increased for various jobs, many even believe that our current age of knowledge is rapidly giving way to the age of innovation, where the ability to solve new ways such as energy use, to create technology or make existing technology applications such as electric cars and efficient solar panels, or even find new knowledge and discoveries that are entirely new industries (Bernie Trilling ,2009). Lack of attention to developing creativity and innovation skills is based in part on a number of common misconceptions that creativity is only for geniuses, or only for young people, or cannot be studied or measured. In fact, creativity is based on something virtually every person's imagination has.

The ability to think creatively is part of the basic capital that must be possessed in looking at the progress of this era. This thinking habit includes skills in exploring and formulating information, processing it, making decisions and solving problems creatively (Wulandari, *et al.* , 2011). One of the reasons for the low creativity of students in Indonesia is the result of a less supportive environment for expressing their creativity, especially in the family and school environment. Creative thinking skills is a way of thinking that contain characteristics: fluency, flexibility , originality and elaboration (Filsaime, 2008).

Wedoro Subdistrict Waru Sidoarjo is a center for making sponge slippers that has been around since the 1980s. According to the information obtained from the Wedoro village government, there are currently around 150 manufacture of slippers which are spread throughout the village. The large number of small industries that have developed there makes it very easy to find the industry. Departing from that, the researcher will utilize local wisdom in making sliper in force material for fourth grade students to foster students' creative thinking skills. Learning with creative thinking skills is expected to bring up creative solutions and ideas in the process of making sponge sliper.

Force material in class IV is new knowledge for students so it needs to be recognized directly through teacher explanations as well as seeing and practicing directly. The concept of various styles can be embedded by choosing the right media especially by giving examples by linking it to real life that is often encountered by students. The activities of the students developed by the researcher are made in such a way that students are able to build their own knowledge about material of various styles by linking local wisdom to the local area in the form of making sliper.

Observation results at MINU Tropodo Waru Sidoarjo as a preliminary study in November 2018 stated that educators had not conducted learning by teaching about local cultural values in the local area. This condition has resulted in the students' lack of understanding of the culture that contains the value of local wisdom in the local area. Learning by using the scientific approach that has been taught without being integrated with the value of existing local wisdom. Scientific approach activities have not been able to foster creativity in giving arguments to answer questions.

Based on the results of interview with educators at MINU Tropodo Waru Sidoarjo on theme 4 Various Jobs. The result, the value of class IV A students in science subjects as much as 60% of the results are below the standard set so it can be concluded that the student learning outcomes are still below the average. According to observations on the activities of the students in the class, educators have explained that the students are fairly active. However, educators should provide stimulation to students to be able to improve their creative thinking skills. Because, so it is necessary to do the learning process by using a scientific approach based on local wisdom to foster the creative thinking skills of students in the school.

II. RESEARCH METHODS

This study used the One-group Pretest-posttest design because the tests were carried out in one group without a comparison group. The design of this study was used to obtain results about pretest scores and post test scores on students' creative thinking skills in material styles and benefits.

Subject and location of the study

The research subject was 4th grade student at MINU Tropodo Waru Sidoarjo consisting of 12 boy and 16 girl. This research was conducted at the MINU Tropodo school which took place at Tropodo 1 No. 1 Street. 241 Waru Sidoarjo.

Data collection technique

1. Observation

Observation as a data collection technique is carried out to obtain research data in the implementation of the learning process based on the learning plan that has been made. Observations to get the desired phenomenon must be carried out by two observers to find out the implementation of the activities of teachers and students, and the obstacles that occur. Observation of the implementation of the lesson plan is done to see the steps of learning. Observations for students by observing the activities contained in learning when it takes place.

2. Creative thinking skills test

To measure the learning outcomes of students using the pretest and posttest in the form of a description that is adapted to the indicators of creative thinking, namely flexibility, detail, fluency and authenticity. Test of creative thinking skills in the form of descriptions are 8 questions used to determine students' creative thinking abilities.

3. Data validity and data analysis

1. Student activities

Observation of the results of student activities is measured by the following formula

$$P = \frac{\Sigma R}{\Sigma N} \times 100\%$$

P : percentage of student activity

ΣR : Amount of frequency of student activity

ΣN : number of frequencies of all student activities

2. Test of creative thinking skills.

To measure creative thinking skills students use the following formula:

$$M = \frac{\Sigma f}{N} \times 100\%$$

Information

M: The ability to think creatively

f : Scores obtained by students

N : Maximum score

Table 1.
 Value Range of Creative Thinking Skills

No.	Value	Predicate	Information	Category
1	> 92-100	A	Very skilled	Complete
2	> 83-92	B	Skilled	Complete
3	≥ 75-83	C	Fairly Skilled	Complete
4	<75	D	Less skilled	Not completed

III.RESEARCH RESULT

A. Student activities

The activity of students in this study is by making observations during the learning process related to the material presented. From the results of the study during the learning process activities with the average student was very interested in the material taught. The use of media and textbooks that are interesting has made students happy about the activity, as evidenced by 100% of students observing the video or picture that was delivered. The use of teaching books is also a concern for children where an average of 98% of students are also interested in existing textbooks. In addition 98% of students were also very enthusiastic about conducting experiments in accordance with the instructions on the worksheet.

Table 2
 Observation results of student activities

No.	Student activities	The first meeting	Second meeting	Third meeting
1	Observe the pictures / videos shown by the teacher	100%	97 %	97%
2	Listen to the explanation	97%	94%	97%
3	Asking question	89%	97%	94%
4	Read textbooks to find important information	97 %	97%	100 %
5	Discuss with friends in groups	97%	94%	86%
6	Students work in groups according to the teacher's instructions	92%	92%	92%
7	Students carry out experiments / observations according to the worksheet instructions	92 %	97%	100 %
8	Students present group work in front of the class	84%	86%	84%
9	Students evaluate the results of other group presentations	86%	89%	86%
10	Students show deviant behavior	89%	94%	94%

B. Test results of students' creative thinking skills

The creative thinking skills test is given twice before and after learning using a device developed at the first meeting. The results of the test of creative thinking skills are used to determine the level of thinking of students. Scores obtained during posttest showed that 92%

of students scored with less skilled categories. After treatment of 28 students using the local wisdom-based santific approach as much as three times 85% of students scored highly skilled and the remaining 15% were skilled.

Table.3 Value of pretest and posttest of creative thinking skills

No.	Student initials	Pretest	Posttest
1	A A	67	92
2	AW	69	90
3	BD	65	95
4	BS	65	93
5	DF	69	92
6	DT	69	89

25	TU	69	89
26	VE	70	89
27	ZJ	70	90
28	ZM	67	90

IV. CONCLUSIONS AND RECOMMENDATIONS

Based on data analysis and discussion of research results, then linked to the formulation of the problem and research objectives, it was concluded that local wisdom-based learning of Wedoro village sandals can improve the creative thinking skills of MINU grade 4th students at Tropodo Waru Sidoarjo on the material styles and benefits in life daily.

Based on the results of the study, there are several suggestions including:

1. Students' creative thinking skills developed using learning tools with a local wisdom-based scientific approach provide positive results for the learning process so that it needs to be broadly developed in other science materials.
2. Learning using learning tools with a scientific approach requires good time management, so that all stages can run optimally.
3. The development of learning devices with a local wisdom-based scientific approach to teach creative thinking skills can be used as a reference in the implementation of the 2013 curriculum.

Abstract - This study aims to produce local wisdom-based teaching material products in Ngingas Village to improve critical thinking skills of fifth grade students of elementary school. This research is a development research owned by Thiagarajan, Semmel, and Semel (1974) or called 4D Research and development which has four stages including: determination, design, development, and distribution. The subject of the study was the development of local wisdom-based science teaching materials in Ngingas Village by being tested in the fifth grade of SDN Ngingas Subdistrict Waru Sidoarjo using the design of the one group pretest-posttest. Teaching materials and their devices have received valid category mode from the validator. The practicality of teaching materials can be shown from (1) The implementation of overall learning gets a very good category. (2) Learning activities show an increase in the stage of understanding the focus of the problem and drawing conclusions. (3) Students' responses to learning using local wisdom-based teaching materials in Ngingas Village have a category of levels of interest from students . The effectiveness of teaching materials that have a good level of readability, learning outcomes on the test of critical thinking skills is very good because being able to achieve the minimum completeness criteria means that students complete in learning, and. The conclusion of this study is that local wisdom-based science teaching materials in Ngingas Village developed meet the criteria of validity, practicality and effectiveness so that they can be used to improve critical thinking skills of fifth grade students of elementary school.

Keyword- Teaching Materials, Local Wisdom, Critical Thinking Skills.

I. INTRODUCTION

Basic education is the main basic pillar of all levels of sustainable education aimed at providing education to prepare students to become human beings who have character, become citizens who are able to carry out their main obligations in achieving their future (Ali in Prastowo, 2013). Considering the importance of basic education in primary schools, the consequence is that the government must strive to improve the quality of relevance of basic education through curriculum development that has complemented the previous curriculum. The 21st century competency for four competencies supports the weaknesses that occur for education in Indonesia by improving students' thinking skills . The importance of critical thinking can make students interact, analyze, or even manipulate information beforehand so it is not monotonous. Critical thinking does not make difficult school learning material easy to understand, but the subject matter can teach a variety of critical thinking skills practiced in everyday life, namely increasing the ability to understand arguments or developing issues so that we can avoid making decisions that incorrect or not in accordance with the problem (Bassham, et al., 2011) .

The teacher as a learning designer must design learning plans according to the needs of students . Good planning will make learning regular so that learning will attract both students . Development of science materials based on local wisdom will help and facilitate the learning process in achieving predetermined goals. Each teacher is obliged to arrange learning tools which consist of: teaching materials, syllabus, learning implementation plans, student activity sheets, and student assessment sheets. Active collaboration between observers of education, stakeholders / community, business world, and bureaucracy, is very significant in the success of local wisdom-based education programs. Local wisdom-based education requires kema m ladies creation and innovation (Asmani, 2012) .

Local wisdom in each area is the basis for policy making at the local level in the fields of health, agriculture, natural resource management and community activities (Tiezzi, et al., 2007). Development of material depends on student books owned by learners. Facts prove that there are many young generations who do not understand the local wisdom that arises in their respective regions, students have not been able to integrate the concept of learning with the phenomena encountered in their environment. Though local wisdom contains local culture from the past that supports life now. Local wisdom is needed in the tradition that grows in the community to manage existing natural and human resources so that sustainability is maintained. Sidoarjo regency, precisely in the

Ngingas Village, Waru District is known as a metal industry village which produces many metal objects both domestically and abroad. So that it is appropriate for the local wisdom of metal villages to be internalized into learning in schools, so that students are more familiar with the local wisdom of metal villages in their area. Because from the results of the questionnaires it turned out that 780% of students stated that they did not yet know the local wisdom in their area could be used as learning materials that supported the material. One of the innovations that can be done to overcome the above problems is to develop teaching materials based on local wisdom in Ngingas Village.

Some alternatives to solve this problem are by developing local wisdom-based teaching materials in Ngingas Village. This teaching material is also adapted to the conditions of students in the surrounding area. Another expected outcome of the development of this teaching material is that it can improve students' critical thinking skills. Critical thinking has many benefits in everyday life. Critical thinking teaches a variety of thinking skills which, if practiced significantly, can improve the ability to understand arguments or issues discussed in teaching materials (Bassham, et al., 2011).

The development of local wisdom-based science teaching materials in Ngingas Village in learning is believed to be one of the teacher's methods for making learning easier for students to understand the science concept, so that their thinking develops. The local wisdom-based development strategy can provide a nurturant effect of developing skills such as critical logical thinking (Hariri, et al., 2016). People who think critically will evaluate and then conclude things based on facts to make decisions (Hassoubah, 2007). So that one characteristic of people who think critically will always look for and explain the relationship between the problems discussed with experience or other similar problems. This relates to the experience of students in utilizing local wisdom in their area in supporting learners' learning about the material encountered in learning.

Critical thinking is often referred to as thinking that seeks deficiencies or mistakes of people or groups, whereas criticism is not the same as criticism which tends to attempt to overthrow or attack others, critical thinking is the ability to issue logical and rational opinions to find facts from a view. This misunderstanding is the limitation of freedom in increasing thinking in order to develop. According to the father of modern critical thinking tradition explained that critical thinking is an activity in weighing, continuing and researching a belief or knowledge that is not easily accepted but by expressing various arguments that support rational conclusions. Critical thinking is considered the same as active thinking (John Dewey in Sihotang, et al, 2012). Critical thinking is taught to students to think critically at different points of view on related issues and their consequences in daily life and evaluate a problem from a social and environmental perspective (Mapeala & Siew, 2015). Critical thinking is a reasonable thing that is reflective thinking focused on deciding what to believe or do, it involves affective dispositions and cognitive skills (Ennis, 1987). The approach used to make it easier to recognize elements in the critical thinking process that can use the FRISCO approach (Ennis, 2012). These elements include : focus, reason, inference, situation, clarity, and overview.

Teaching materials are the most important supporting part for curriculum development in the implementation of education. Teaching materials are part of learning tools including syllabus and plan for implementing learning. Teaching material is a composition of materials collected from various learning resources that are systematically made (Prastowo, 2016). The importance of teaching materials used by various parties has functions including for teachers and students. For teachers, among others, can shorten the time in teaching activities, change the teacher from the teacher to become a facilitator, improve the learning process to be more interactive and effective, as a reference in focusing all learning activities that are part of the substance of competencies taught to students, as well as evaluation tools mastery of learning outcomes.

Local wisdom is the personality or identity of the inventions, feelings and intentions of a nation that has the ability to absorb, even cultivate cultures originating from foreign cultures or other nations into their own character and abilities (Wibowo, 2015). Local wisdom is a habit that is formed in the community based on the results of a particular nation which is not necessarily owned by other nations. For this reason, skills are needed to maintain the management of existing natural resources by increasing human resources owned by a nation so that the existing culture remains and is preserved. Local wisdom-based education is education that utilizes the needs of global competitiveness and local excellence in aspects of economics, language, culture, information and communication technology, students' human and environmental conditions, etc. which contain benefits for the development of student competencies at all levels of education units. especially elementary schools both formal and non-formal education that have accreditation or recognition from the government (Toto Ruhimat in Asmawi, 2012).

II. RESEARCH METHODE

The following research is development research using the 4D model, namely the development of local wisdom-based Science Teaching Materials in Ngingas Village to improve the critical thinking skills of fifth grade students of elementary school. The subjects in this study were local wisdom-based science teaching materials in Ngingas Village to improve the critical thinking skills of fifth grade students of State Elementary School in the even semester of the school year 2018-2019. This research will be carried out in the even semester of the school year 2018-2019 which is located in Ngingas Elementary School, Waru District, Sidoarjo Regency. Ngingas Elementary School was chosen as a research site because it was one of the areas where most of the population worked as metal entrepreneurs which was a form of local wisdom in the school. The research design uses research and development development research designs belonging to Thiagarajan, Semmel, and Semel (1974) or referred to as 4D which consists of four stages including: Define, Design, Develop, and Disseminates. The stages of defining to analyze the objectives and boundaries of the subject matter include five steps, among others, a needs analysis based on the characteristics and abilities of fifth grade elementary school students shows that 80% of students have never used local wisdom to develop heat transfer

material. Analysis to students related to the academic ability of students, the emotional and social background of students, physical characteristics, and the level of cognitive development of students . design phase consists of several stages, among others by arranging the test, media selection, the selection format, the preliminary draft. The development phase includes teaching materials, syllabus, learning implementation plans (RPP), student activity sheets (LKPD) , and tests of critical thinking skills. Validity learning measured from teaching materials and learning tools, learning practicality measured by adherence to learning, the activities of students , and the response of students to learning. The effectiveness of learning is measured by the readability of teaching materials and the increase in learning outcomes from tests of critical thinking skills from pretest to posttest.

III. RESULT AND DISCUSSION

Preparation of research results based on data obtained during the development of teaching materials and the results of limited trials conducted at the Ngingas Waru Sidoarjo. The research subject was in the form of local wisdom-based teaching materials in Ngingas Village related to heat transfer, while those acting as observers were fifth grade teachers at Ngingas Elementary School. The results of the development and implementation of teaching materials developed along with supporting devices include syllabus, Learning Implementation Plan (RPP), Student Activity Sheet (LKPD), and Critical Thinking Skills Test.

A. Results Validity development of teaching materials

Complete and understandable layout design of teaching material contents. Complete teaching materials include writing titles, subtitles, understanding concepts, page numbers, and captions of each material supported by related images. A consistent layout according to a predetermined pattern with spaces between paragraphs that are clearly arranged between the right and left margins. Teaching materials can be understood by the use of the upper and lower desian , as well as the middle part based on white to clarify the material contained in the teaching material so as to facilitate the level of readability of students . Local wisdom chosen in the study of this material included making crowbar. Crowbar is an object made of iron, the shape of both ends is flat and pointed, making semi-traditional crowbar with combustion. Making crowbar is one form of activity that is still semi-traditional as a work carried out for generations . shows that overall the development of teaching materials has a valid category mode. The average percentage of suitability of the assessment given by the validator to the instructional materials developed is 94.15%. The development of teaching materials is declared valid based on the preparation in accordance with the steps in accordance with the development instruments found in the Minister of Education and Culture in 2017.

B. Practicality of Teaching Materials

Practicality teaching materials can be observed from some of the following activities: (1) H acyl learning keterlaksanaan shows the general assessment of the enforceability of the third meeting of the RPP on many found very good category. Overall the percentage of RPP implementation in the score is between 75% and 100%. So that it can be stated that learning using local wisdom-based teaching materials can be carried out very well. (2) Student activities during the learning process using local wisdom-based teaching materials indicate that the activities of students during the learning process using observed local wisdom-based teaching materials have a very good category. Both observers have the same and consistent results so that the instrument is said to be very good and reliable. In the activity propose a simple explanation students have the ability to provide an explanation based on existing knowledge. This affects the existence of teaching materials that support students to better understand the existence of existing local wisdom related to learning materials. While the irrelevant aspects there are still students who do not focus on learning and are a little crowded which makes the class less conducive. (3) The response of students' interest in the development of teaching materials carried out in class towards the use of local wisdom-based teaching materials in learning to improve critical thinking skills. The results of the response of students in a questionnaire to measure the practicality of teaching materials that produce a response that is carried on the process of learning, t erdapat 20 questions to support the development of teaching materials so that researchers concluded that based teaching materials keraifan local village Ngingas developed by the researchers have the category level of interest higher than students .

C. Effectiveness of Teaching Materials

The effectiveness of teaching materials is measured from the results of readability and learning outcomes of tests of critical thinking skills. (1) The readability test of local wisdom-based teaching materials is used to determine the level of readability of the teaching materials developed. The results of the calculation using sentence hitching by using appropriate words so that the teaching material can be read shows the average number of words that can be completed by students is 36 words out of 50 words or the percentage obtained is 72%. This shows that teaching materials based on local wisdom can be used in learning activities. (2) Practicality Critical thinking skills are assessed using assessment rubrics that are presented in the form of numbers. The following results of the pretest and posttest of the critical thinking of students in using local wisdom-based teaching materials in Ngingas Village showed that the average results of the prestige scores of students' critical thinking skills were 84.8 % . The results of critical thinking tests can be observed in table 1.

Table 1 Learning Outcomes Pretends and Postings Critical Thinking Skills

No.	Name	Value				N	Kat
		Pretest	Completeness	Postes	Completeness		
1	FS	24	Not completed	42	Not completed	0.23	Low
2	Elementary school	30	Not completed	84	Complete	0.68	Is being

No.	Name	Value			N	Kat	
		Pretest	Completeness	Postes			Completeness
3	AF	38	Not completed	88	Complete	0.64	Is being
4	ZS	36	Not completed	88	Complete	0.65	Is being
5	SW	80	Complete	100	Complete	0.25	Low
6	FZ	40	Not completed	94	Complete	0.68	Is being
7	AF	82	Complete	100	Complete	0.23	Low
8	ID	36	Not completed	94	Complete	0.73	High
9	MA	22	Not completed	92	Complete	0.88	High
10	A A	36	Not completed	92	Complete	0.7	High
Average		42.4		84.8		0.742	Is being
% Complete		20%		90%			
% hasn't finished yet		80%		10%			

N-gain value meme n Uhi category is, it indicates there is an average increase in critical thinking test students after learning using teaching materials based on local wisdom. Students who complete learning are as much as 90%, while those that have not been completed are 10%. Based on the analysis of the results of critical thinking tests the students' incompleteness as a result of lack of understanding the text contained in the test questions.

Based on this description, local wisdom-based science teaching materials in Ngingas Village along with supporting tools for overall learning have met all the criteria of a good learning component because they have validity criteria, practicality, and effectiveness. Teaching materials that have been developed and received validation from the expert team have a high percentage of agreement .

IV. CONCLUSION

Data analysis and discussion of the results of the discussion from the previous chapter related to the formulation of the problem and the purpose of the study, resulted in the conclusion of local wisdom-based science teaching materials in Ngingas Village along with supporting devices that have been developed as follows.

1. Science development of teaching materials based on local wisdom in the village Ngingas along with supporting devices have been validated by a team of experts has declared to the level of an invalid 's good at 94.13% and can be used to improve critical thinking skills fifth grade elementary school.
2. Learning using science materials based on local wisdom to improve critical thinking skills has good practicality criteria supported by the implementation of learning plans , including student activities that have a good category during the learning process, as well as student responses of more than 70% who are interested in teaching materials developed.
3. Local wisdom-based science teaching materials in Ngingas Village have a readability level of 72% which means teaching materials are easily understood to influence the increase in results from pretest to post-test to reach completeness so that the developed learning material meets the effectiveness criteria for improving critical thinking skills of fifth grade students .

Suggestions that can be stated by researchers related to research that has been done include:

1. The application of local wisdom-based science teaching materials in Ngingas Village to improve critical thinking skills for teachers must be able to further explore the local wisdom found in the area of learning and be able to provide a link between local wisdom and the knowledge of natural science in it.
2. Application of science teaching materials based on local wisdom in the village Ngingas to improve critical thinking skills of students can be developed for conserve where local knowledge of the region with the cooperation of stakeholders in the area.
3. Learning related to improving students thinking skills is very important to be applied in learning activities because it can attract students interest and activeness .
4. Learning by using local wisdom-based teaching materials in Desa Ngingas can be developed by expanding the subject of students along with a more complex study of material.

Study Attitude and Academic Achievement in Biology at Secondary School Level in Mubi Metropolis of Adamawa State

Dr Dorcas Oluremi FAREO

Department of Educational Foundations, Adamawa State University, Mubi.

DOI: 10.29322/IJSRP.9.08.2019.p9253

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9253>

Abstract- This study examined the study attitude and academic achievement in Biology at secondary school level in Mubi metropolis of Adamawa State. The population of the students was all students in public secondary schools in Mubi metropolis of Adamawa State, out of which a sample size of three hundred was drawn through stratified sampling technique. The research instrument for data collection was self-developed by the researcher. The validity of the instrument titled “Study Attitude and Academic Achievement in Biology at Secondary School Level Questionnaire” was carried out by an expert in Counselling Department, while t-test reliability method was used to carry out the reliability of the instrument, and the reliability co-efficient was 0.85. Data were analyzed using mean, Pearson moment correlation coefficient and t-test statistics. Students generally have a favourable attitude towards Biology. Attitude towards Biology is influenced by the perception and beliefs about Biology, learning abilities and competence in Biology and the previous performance and rankings in Biology in schools where the later poses a negative influence. The attitudes of the students also influence their confidence level in Biology mostly in terms of their feeling about getting good grades, tackling tasks and their desire to pursue Biology related courses in the future. It was concluded that achievements in Biology mostly can be attributed to the students attitude towards the subject, school environments, abilities, future interest, personal effort. It was recommended that school administration should advantageously make use of the learners’ positive attitude to create a strong inclination and culture of Biology as a subject in secondary schools where the students can score favourably like in any other subject and the curriculum designers and the teachers should articulate well on the usefulness and applicability of Biology in general so that students create positive minds towards the subject and subsequently strive to improve in the subject.

Index Terms- Study attitude; study habit; factors; study skills and academic achievement.

I. INTRODUCTION

Student attitude towards study is a complex construct. Attitude is a fairly stable emotional tendency to respond consistently to some specific object, situation, person, or category of people. It has three components: cognitive core, affective values and

behavioural action tendencies. The cognitive aspect of attitude consists of beliefs and ideas that a person has about the attitude object. The affective component includes the feelings of like and dislike toward any object, and the behavioural aspect consists of intentions to respond in a particular way toward the object. The making of perceptual and cognitive organization, with reference to formation of attitudes, depends upon the individual’s social environment. The process of social interaction, which starts from the family, brings about certain developments, including formation of attitudes (Uroog, 2000).

The study attitude is one of the main factors that affect academic performance of learners. Academic achievement is a function of study attitude of the students (Hussain, 2006). Numerous studies have reported a positive correlation between attitudes toward subject and achievement (Sarwar, Bashir & Alam, 2017; Ajayi, Kassim, Adewale & Abayomi, 2016; Crede & Kuncel, 2008; Ogunyemi & Hassan, 2011). Yet, in spite of the perceived importance of study habits and study attitudes to educational achievement, very little attention were given by academic institutions to improve these factors. This is manifested from the very low understanding level and the equally poor and deteriorating knowledge of many students which is still a great concern of educators, parents and governments (Riaz, Kiran, Malik cited in Aquino, 2011). This problem is pointed out by Hurlburt, *et al.* in Aquino, (2011) as contextual and systemic: it is rooted in the educational process shared by students and schools. Cultural differences among societies will be reflected in differences in attitudes among the individuals in those societies. In Pakistan, there is difference in rural and urban cultures, so the attitudes of rural and urban students are different. In rural areas, the people are comparatively simple and have positive attitudes toward life, so they are more hard-working. The social roles of males and females are quite distinct in Pakistan. The girls are trained to confine themselves in the house and to serve the family whereas boys remain outside the house most of the time and indulge themselves in different activities. In early adolescence, the peers can positively and negatively affect one’s attitude (Duke & Meckel in Sarwar, Bashir & Alam (2017).

Study attitude serves as an index of how we think and feel about studying. If the learning experience is not pleasant, then the resulting study attitude is not favourable. Successful learners adopt positive study attitudes. [McHale, Kim and Whiteman \(2006\)](#) stated that siblings are a fixture in the family lives of children and adolescents, and a body of work documents their role in one

another's everyday experiences as companions, confidantes, combatants, and as the focus of social comparisons. By extension the attitude of elderly ones towards studying will consequently affect the adolescent. From the foregoing, it could be deduced that Biology is one of the science subjects that is popular and studied by students in order to be enrolled in medical sciences programmes which concern with human life. Considering the reasons above, one would have expected the students of Biology to do well. Rather, their performances in various examinations are a thing of concern as many of the students who enrolled for biology examination are falling below credit pass in the subject. This assertion is supported by the examination performances of all Nigerian students in WASSCE and NECO.

Obe in Ajayi, Kassim, Adewale & Abayomi, (2016) referred to study habit as those behaviours that one manifest when studying such as listening to music, chewing kolanut, smoking coffee, taking memory pills and ant sleeping drugs, lying down while studying and so on. He said further that not all behaviours manifest during study positive rather those that are positive are called study habits. He concluded that study skills is the ability to acquire information, do mental processing of information for logical organization and understanding, re-reading and memorizing for a long time meaningful retention and recalling of information on important occasions such as during test or during examination situations.

According to Ball in Ajayi, *et al.* (2016), the following study habits usually contribute to unsatisfactory grade of students in tests or examinations: procrastination and overloading, lack of study time plan, not making notes while reading, truancy by skipping classes or refusal to take notes during lectures, laziness and ignorance, memorization and orphaning. He concluded that many committed students experience frustration and despair in schools not because they lack the potential, but because they do not have the appropriate study skills to learn. This assertion was supported by Rana and Kausar (2011) who said that many students fail not because they lack ability but because they do not have adequate study skills.

Some of the techniques of studying are: Robinson's Formula for Effective Study which is Survey, Question, Read, Recite and Review (SQ3R), Pauk's Formula for Effective Study (OK4R) which stand for overview, keywords in the study piece, Read, Review, Reflect and Review, Tussig's Formula for Effective Study (PAT) which stand for Preview, attack (Rob, Read, Precite) and Pauk's Formula for Effective Note-taking (5Rs) which stand for Record, Reduce, Recite, Reflect and Review. The SQ3R method stands for Survey, Question, Read, Recite and Review.

- Survey means get the best overall picture of what you're going to study BEFORE you study it in any detail. It's like looking at a road map before going on a trip.

- Question - ask questions for learning. Questions should lead to emphasis on the what, why, how, when, who and where to study contents. As you answer them, you will help to make sense of the material and remember it more easily because the process will make an impression on you.

- Read - reading is not running your eyes over a book or material, it means read in order to answer the questions you have asked yourself or questions that the instructor or author had asked. Always be alert to bold or italicized print. Also, when reading, be

sure to read everything, including tables, graphs, and illustrations because they can convey ideas better than the written texts.

- Recite and Review - the process of recite and review involve catabolization and anatomization process. When you recite, you stop reading periodically to recall and reflect on what you have read, while review on the other hand means breaking down of the information into smaller pieces or items which will make the retention easier, the more you rehearse, the more information you retain. A review is a survey of what you have covered and re-readings an important part of the review process.

Consequently, the need to improve student's study attitudes is deemed necessary to improve student's academic achievement. Accordingly, it is essential for schools to determine factors which affect these characteristics adversely propose remedial measures and employ strategies for the development of good study attitudes (Hussain, 2006). This is further supported by Hurlburt, *et al.* cited in Aquino, (2011) from their study which suggested that a confluent educational philosophy (systemic and holistic) and using confluent educational strategies (through which students' social-emotional and personal empowerment needs are met) may enhance the school experience, improve study attitudes, and ameliorate the high dropout rate among the students.

There are many factors that influence attitudes and achievement among adolescents. Some of the factors are associated with parental background and family environment. Other factors relate to individual characteristics such as study attitude, self-concept, locus of control, and achievement motivation. Still other variables are associated with schools influences such as class climate, teachers, and administrative styles (Talton and Simpson in Soltani, 2011). According to Osborne *et al.* in Soltani, (2011). Studies have incorporated a range of components in their measures of attitudes to science including: the perception of the science teacher; anxiety toward science; the value of science; self-esteem at science; motivation towards science; enjoyment of science; attitudes of peers and friends towards science; attitudes of parents towards science; the nature of the classroom environment; achievement in science; and fear of failure on course. The premise that improving study attitudes will lead to academic success, this study will be conducted to assess the study attitude and academic achievement in biology at secondary school level in Mubi metropolis of Adamawa State.

II. STATEMENT OF THE PROBLEM

The differences in attitudes of male and female students towards Biology have been an issue in many countries. The researcher observed that students' achievement in Senior Secondary school Certificate Examination (SSCE) in the study area has shown that the level of students' academic achievement in Biology over the years was not encouraging. Also the researcher observed that in the study area, the students with distinctions in Biology and other science subjects in West Africa Senior Secondary School Certificate Examination (WASSCE) and National Examination Council (NECO) are low. However, because of the nature of Biology as the most important science subject in medical sciences, one would expect majority of the students to have distinctions and credit passes in the subject.

This weak performance called for concern by researchers, parents, school administrators and other stakeholders in the education business. The low performance is likely to be caused by some factors like low cognitive ability, medical problems, gender, prematurity, teachers' variable, and government factors more especially the negative attitude of students towards their studies. Consequently, students get involved in very many activities outside their studies which are not helpful. They may engage in very many unlawful activities like, cultism, robbery, prostitution, spending much time on WhatsApp and tyranny, among other vices. Hence, this study sought to investigate the extent to which study attitude determined students' academic achievement in Biology at secondary school level in Mubi Metropolis of Adamawa State.

III. PURPOSE OF THE STUDY

The main purpose of this study is to investigate the study attitude and students' academic achievement in Biology at secondary school level in Mubi Metropolis of Adamawa State. The specific objectives of this study are to;

1. Determine the study attitude of secondary school students in Biology in Mubi Metropolis.
2. Determine the factors influencing study habits of secondary school students in Biology in Mubi metropolis.
3. Investigate the academic performance of secondary school students in Biology in Mubi Metropolis.
4. Examine the correlation between study attitude and achievement of secondary school students in Mubi Metropolis.
5. Compare the study attitude of secondary school students in the rural and urban areas in Mubi Metropolis.

Research Questions

The following two research questions were formulated to guide the researcher

1. What is the study attitude of secondary school students in Biology in Mubi Metropolis?
2. What are the factors influencing study habits of secondary school students in Biology in Mubi metropolis.

IV. RESEARCH HYPOTHESES

Three null hypotheses were formulated and will be tested at 5% level of significance

H₀₁: There is no significant difference between study attitudes of rural and urban secondary school students.

H₀₂: There is no significant difference between the study attitudes of female and male in secondary school students.

H₀₃: There is no significant relationship between study attitude scores and achievement scores at the secondary school level.

Research Design

This study adopted a survey research design to assess study habit and academic achievement in Biology at secondary school level in Mubi Metropolis of Adamawa state. An assessment of the study habit and students' academic achievement will be carried out to determine the relationship between study habit and students' academic achievement.

3.2 Population and Sample

The target population for this study comprised of all public secondary schools students of secondary schools with three hundred as sample size. From the population, six schools were selected by simple random sampling technique while three hundred students were selected by simple random technique. Therefore fifty students were selected from each school.

Research Instrument

A self-developed questionnaire titled 'Study Attitude and Academic Achievement in Biology at Secondary School Level Questionnaire' (ATAABSSLQ) was used to collect data. The questionnaire was divided into three sections. Section A comprised of demographic characteristics of teachers such as name of school, sex, class taught and school location. Section B comprised of 20 items on study attitude of secondary school students in Biology. Section C comprised of 15 items on the factors influencing study habit of secondary school students in Biology. The record of continuous assessment will be collected from sampled schools.

Validity and Reliability of Instrument

The validity of the instrument was carried out by an expert in Counselling Psychology in the Department of Science Education, Adamawa State University, Mubi. The reliability of the research instrument was carried out in Government Secondary School (GSS) Hong which is outside the study area. The researcher used test-retest reliability method. The first test was administered on 30 teachers, while the second test was administered within the interval of a week. The reliability coefficient was 0.85.

Data Collection and Analysis

The researcher with two research assistants administered the questionnaires and collected them on the spot. Thus, retrieved data were analyzed using descriptive and inferential statistics such as percentage and t-test analysis.

V. RESULTS

Research Question 1: What is the study attitude of secondary school students in Biology in Mubi Metropolis?

Table 1: Summary of responses relating to the study attitude of secondary school students

S/N	Items	A (%)	D (%)	Total (%)
1	When I don't understand something I ask the teachers.	213(71)	87(29)	300(100)
2	I exchange views with my classmates about what we study.	266(88.67)	34(11.33)	300(100)
3	In my exercise or study-works I concentrate on others which are already corrected.	153(51.00)	147(49.00)	300(100)
4	When I finish a test I read it again before handing it.	275(91.67)	25(8.33)	300(100)
5	When I study, I use to consult other books besides the adoption of Biology book to clarify or widen/increase knowledge.	248(82.67)	52(17.33)	300(100)
6	I revise frequently so as not to forget what I have learnt.	242(80.67)	58(19.33)	300(100)
7	To learn something, I have to understand it before.	173(57.67)	127(42.33)	300(100)
8	I read all the questions of the test before beginning to answer it.	197(65.67)	103(34.33)	300(100)
9	When I have to do some study-work, before starting, I read a lot about the theme, organize the ideas and write an outline.	168(56.00)	132(44.00)	300(100)
10	I ask questions on what I study and try to answer them.	157(52.33)	143(47.67)	300(100)
11	I study Biology daily.	203(67.67)	97(32.33)	300(100)
12	I feel distracted when I am studying Biology.	145(48.33)	155(51.67)	300(100)
13	I have a jotter that is used to take down note during Biology study.	207(69.00)	93(31.00)	300(100)
14	During Biology class, I take down note always.	265(88.33)	35(11.67)	300(100)
15	I always compare my class note with the Biology textbook.	226(75.33)	74(24.67)	300(100)
16	I always relax for 30 minutes after 2 hours study	172(57.33)	128(42.67)	300(100)
17	I always attained Biology class.	211(70.33)	89(29.67)	300(100)
18	I always study my Biology note before exams.	285(95.00)	15(5.00)	300(100)
19	I have a sense of mental pressure before examination.	163(54.33)	137(45.67)	300(100)
20	I feel afraid of examination failure.	297(99.00)	3(1.00)	300(100)

Table 1 shows that out of 300 respondents 212(71.00%) agreed with the statement that when I don't understand something I ask the teachers, while 87(29.00%) disagreed. Out of 300 respondents 266(88.67%) agreed that I exchange views with my classmates about what we study, while 34(11.33%) disagreed. Out of 300 respondents 152(51.00%) agreed with the statement that In my exercise or study-works I concentrate on others which are already corrected, while 147(49.00%) disagreed with the statement. Majority of the respondents 275(91.67%) agreed with the statement that when I finish a test I read it again before handing it, while 25(8.33%) disagreed. Also, majority of the respondents 248(82.67%) agreed with the statement that when I study, I use to consult other books besides the adoption of Biology book to clarify or widen/increase knowledge, while 52(17.33%) disagreed. Out of 300 respondents 242(80.67) agreed with the statement that I revise frequently so as not to forget what I have learnt, while 58(19.33%) disagreed. Out of 300 respondents 173(57.67%) agreed with the statement that to learn something, I have to understand it before, while 127(42.33%) disagreed. Out of 300 respondents 197(65.67%) agreed with the statement that I read all the questions of the test before beginning to answer it, while 103(34.33%) disagreed. Out of 300 respondents 168(56.00%) agreed with the statement that when I have to do some study-work, before starting, I read a lot about the theme, organize the ideas and write an outline, while 132(44.00%) disagreed with the statement. Out of 300 respondents 157(52.33%) agreed with the statement that I ask questions on what I study and try to answer them, while 143(47.67%) disagreed.

The table further shows that out of 300 respondents 203(67.67%) agreed that they study Biology daily, while 97(32.33%) disagreed. Out of 300 respondents 145(48.33%) agreed with the statement that I feel distracted when I am studying Biology, while 155(51.7%) disagreed. Out of 300 respondents 207(69.00%) agreed with the statement that I have a jotter that is used to take down note during Biology study, while 93(31.00%) disagreed. Out of 300 respondents 265(88.33%) agreed with the statement that during Biology class, I take down note always, while 35(11.67%) disagreed with the statement. Out of 300 respondents 226(75.33%) agreed with the statement that I always compare my class note with the Biology textbook, while 74(24.67%) disagreed with the statement. Out of 300 respondents 172(57.33%) agreed with the statement that I always relax for 30 minutes after 2 hours study, while 128(42.67%) disagreed with the statement. Majority of the respondents 211(70.33%) agreed with the statement that I always attained Biology class, while 89(29.67%) disagreed with the statement. Also, majority of the respondents 285(95.00%) agreed with the statement that I always study my Biology note before exams, while 15(5.00%) disagreed with the statement. Out of 300 respondents 163(54.33%) agreed with the statement that I have a sense of mental pressure before examination, while 137(45.67%) disagreed with the statement. Out of 300 respondents majority 297(99.00%) agreed with the statement that I feel afraid of examination failure, while 3(1.00%) disagreed with the statement.

From the result above it can be established that students attitude toward Biology is generally positive. This indicated that

Biology students in Mubi metropolis have positive attitude towards Biology and they love the subject.

Research Question 2: What are the factors influencing study habits of secondary school students in Biology in Mubi metropolis.

Table 2: Summary of responses relating to factors that influence study habits of secondary school students in Biology

S/N	Items	A (%)	D (%)	Total (%)
1	My parents always encourage me to study my books.	215(71.67)	85(28.33)	300(100)
2	I have my note and writing materials to take Biology note always.	213(71.00)	87(29.00)	300(100)
3	My Biology teacher doesn't miss his/her lesson.	196(65.33)	104(34.67)	300(100)
4	My Biology teacher gives us test three times per term and always mark and give back feedback.	202(67.33)	98(32.67)	300(100)
5	My Biology teacher always accompany every topic teach with practical.	127(72.33)	83(27.67)	300(100)
6	My colleagues always encourage me to read my books.	172(57.33)	128(42.67)	300(100)
7	My parents always employed lesson teachers to teach me Biology at home.	149(49.67)	151(50.33)	300(100)
8	My school Biology laboratory is well equipped.	143(47.67)	157(52.33)	300(100)
9	I always understand Biology teaching.	194(64.67)	106(35.33)	300(100)
10	I always take my breakfast before going to school.	283(94.33)	17(5.67)	300(100)
11	The Biology laboratory is always congested, and this discourage me from attending Biology practical.	162(54.00)	138(46.00)	300(100)
12	My Biology teacher is very good in explaining new topic.	172(57.33)	128(42.67)	300(100)
13	I don't have Biology textbooks.	94(31.33)	206(68.67)	300(100)
14	My parents always attend the PTA meetings.	156(52.00)	144(48.00)	300(100)
15	My Biology teacher always gives Biology notes to class captain to write for us.	163(54.33)	137(45.67)	300(100)

Table 2 shows that out of 300 respondents 215(71.67%) agreed with the statement that my parents always encourage me to study my books, while 85(28.33%) disagreed with the statement. Out of 300 respondents 213(71.00%) agreed with the statement that I have my note and writing materials to take Biology note always, while 87(29.00%) disagreed with the statement. Out of 300 respondents 196(65.33%) agreed to the statement that my Biology teacher doesn't miss his/her lesson, while 104(34.67%) disagreed with the statement. Majority of the respondents 202(67.33%) agreed with the statement that my Biology teacher gives us test three times per term and always mark and give back feedback, while 98(32.67%) disagreed with the statement. Out of 300 respondents 217(72.33%) agreed with the statement that my Biology teacher always accompany every topic teach with practical, while 83(27.67%) disagreed with the statement. Out of 300 respondents 172(57.33%) agreed with the statement that my colleagues always encourage me to read my books, while 128(42.67%) disagreed with the statement. Out of 300 respondents 149(49.67%) agreed with the statement that my parents always employed lesson teachers to teach me Biology at home, while 151(50.33%) disagreed with the statement. Out of 300 respondents 143(47.67%) agreed with the statement that my school Biology laboratory is well equipped, while 157(52.33%) disagreed with the statement.

The table further shows that out 300 respondents 194(64.67%) agreed with the statement that I always understand

Biology teaching, while 106(35.33%) disagreed with the statement. out of 300 respondents majority 283(94.33%) agreed with the statement that I always take my breakfast before going to school, while 17(5.67%) disagreed with the statement. Out of 300 respondents 162(54.00%) agreed with the statement that The Biology laboratory is always congested, and this discourage me from attending Biology practical., while 138(46.00%) disagreed with the statement. Out of 300 respondents 172(57.33%) agreed with the statement that my Biology teacher is very good in explaining new topic, while 128(42.67%) disagreed with the statement. Out of 300 respondents 94(31.33%) agreed with the statement that I don't have Biology textbooks, while 206(68.67%) disagreed with the statement. Out of 300 respondents 156(52.00%) agreed with the statement that my parents always attend the PTA meetings, while 144(48.00%) disagreed with the statement. Out of 300 respondents 163(54.33%) agreed with the statement that my Biology teacher always gives Biology notes to class captain to write for us, while 137(45.67%) disagreed with the statement.

From the results above it can be established that the factors that influence study habit of secondary school students in Mubi metropolis are my parents always encourage me to study my books, writing materials, Biology teachers punctuality in class, frequent assessment, practical class in Biology, encouragement by the peer group, lesson teacher to teach at home, proper understanding of the subject, proper feeding of the students, effectiveness and efficiency of Biology teachers, availability of

Biology textbooks, parental involvement in their children studies and the Biology teachers always give notes on what being taught to students.

Hypothesis Testing

Hypothesis 1: There is no significant difference between study attitudes of rural and urban secondary school students.

Table 3: t-test analysis of the differences between study attitude of rural and urban students

Variable	N	Mean	SD	df	t-cal.	t-crit.	P
Rural	100	231.30	47.78	298	2.578	1.960	P > 0.05
Urban	200	256.90	58.62				

*** Significant**

Table 3 reveals that t-cal. (2.578) is greater than t-crit. (1.960) at 0.05 level of significance. The null hypothesis, which states that there is no significant difference between study attitudes of rural and urban secondary school students, is rejected. Therefore, there is significant difference between study attitudes of rural and urban secondary school students.

Hypothesis 2: There is no significant difference between the study attitudes of female and male in secondary school students.

Table 4: t-test analysis of the differences between study attitude of female and male students

Variable	N	Mean	SD	df	t-cal.	t-crit.	P
Male	150	208.60	43.56	298	1.112	1.960	P > 0.05
Female	150	195.35	37.22				

*** Not Significant**

Table 4 reveals that t-cal. (1.112) is less than t-crit. (1.960) at 0.05 level of significance. The null hypothesis, which states that there is no significant difference between the study attitudes of female and male in secondary school students is accepted.

Therefore, there is no significant difference between the study attitudes of female and male in secondary school students.

Hypothesis 3: There is no significant relationship between study attitude scores and achievement scores at the secondary school level.

Table 5: Pearson correlation of attitude score and academic achievement

Variables	N	Mean	SD	df	r-calculated	r-critical
attitude score	300	201.48	40.64	598	0.266	0.087
Academic achievement	300	64.63	19.15			

***Significant**

Table 5 shows that the r-calculated (0.266) is greater than r-critical (0.087) at 0.05 confidential levels. The null hypothesis, which states that there is no significant relationship between study attitude scores and achievement scores at the secondary school level, is therefore rejected. This implies that there is a significant relationship between study attitude scores and achievement scores at the secondary school level.

VI. DISCUSSION

The findings of the study revealed that students study attitude toward Biology is generally positive. This indicated that Biology students in Mubi metropolis have positive attitude towards Biology and they love the subject which help them to achieved better results in the subject. This findings is in line with Valle (2009) who aimed at studying the relationship between university students' self-efficacy for performance and learning and their effort regulation. The researcher found that when students possessed a higher self-efficacy, they were more likely to put more effort into their academic studies. Similarly, Khan and

Ali (2013) enquired about the relationship between attitudes of students towards Science with their academic achievement and found that both the variables are interlinked and correlated. The higher the positive attitude of students towards Science, the more likely to get better results in their academics. Apart from all the above studies, a large number of studies (Ali & Awan, 2013; Tiwari & Anwar, 2015; Hacieminoghu, 2016; John, 2014) have also proclaimed that those students who possess positive attitude towards Science also do better in their academic achievement.

The result further revealed that the factors that influence study habit of secondary school students in Mubi metropolis are my parents always encourage me to study my books, writing materials, Biology teachers punctuality in class, frequent assessment, practical class in Biology, encouragement by the peer group, lesson teacher to teach at home, proper understanding of the subject, proper feeding of the students, effectiveness and efficiency of Biology teachers, availability of Biology textbooks, parental involvement in their children studies and the Biology teachers always give notes on what being taught to students. This finding agrees with Talton and Simpson in Soltani, (2011) who stated that there are many factors that influence attitudes and achievement among adolescents. Some of the factors are associated with parental background and family environment. Other factors relate to individual characteristics such as study attitude, self-concept, locus of control, and achievement motivation. Still other variables are associated with schools influences such as class climate, teachers, and administrative styles. Similarly, According to Osborne *et al.* in Soltani, (2011) studies have incorporated a range of components in their measures of attitudes to science including: the perception of the science teacher; anxiety toward science; the value of science; self-esteem at science; motivation towards science; enjoyment of science; attitudes of peers and friends towards science; attitudes of parents towards science; the nature of the classroom environment; achievement in science; and fear of failure on course.

Test of hypothesis one revealed that there is significant difference between study attitudes of rural and urban secondary school students. This finding is contrary to the reports of Dike, Anyanwu, Zachariah and Folashade (2018) who did not found significant difference between students performance in Chemistry, Physics and Biology from school to school. Similarly, Lawrence (2012) who also did not found significant difference between students' performance with respect to school environment i.e. urban and rural schools.

Test of hypothesis two revealed that there is no significant difference between the study attitudes of female and male in secondary school students. This finding agrees with Bhan and Gupta (2010) conducted a study for academic achievement and study habit among the students belonging to scheduled caste and non-scheduled caste group. The result revealed that sex has no significant impact on academic achievement and study habit of students. This finding is contrary to Singh (2011) who examined academic achievement and study habits of higher secondary students and the results indicate that girls and boys differ significantly in their study habits and academic achievement.

Test of hypothesis three revealed that there is a significant relationship between study attitude scores and achievement scores at the secondary school level. This finding agrees with Okpala (2006) who reported a positive relationship between students'

attitude and their performance in academics. Also Narmadha and Chamundeswari (2013) found that there exists a positive impact of learning Science on academic achievement. Even though most studies stated that there was a positive relationship between study attitude and academic achievement, there were few studies arguing the opposite. For example, in a study conducted by Chassie, O'Conner and Walther (2004

VII. CONCLUSION

Students generally have a favourable attitude towards Biology. Though Positive attitudes alone may not significantly predict good performance as shown by the students' grades, there are other mediating factors including student effort and commitment that connect attitude and achievement without which attitude alone may not reflect achievement. Students attribute their achievements in Biology mostly to the school environments, abilities, future interest and personal effort. Hence, the students should be motivated through persuasion, use of reinforcements, provision of learning resources and improving on teacher support which cuts across the home and the school environments.

VIII. RECOMMENDATIONS

Based on the findings of the study, the study makes the following recommendations:

- The school administration should advantageously make use of the learners' positive attitude to create a strong inclination and culture of Biology as a subject in secondary schools where the students can score favourably like in any other subject.
- The curriculum designers and the teachers should articulate well on the usefulness and applicability of Biology in general so that students create positive minds towards the subject and subsequently strive to improve in the subject.
- The Ministry of education, teachers and parents should ensure that performance of Biology among students is improved so as to dislodge the negative attitude and create a positive one on performance of Biology in secondary schools. This will counteract the effect of previous failures and rankings in the subject which may degenerate into negative school culture and definitely low performance.
- The parents and the teachers should explore other avenues to change the behaviour of students towards Biology and the interests of the students towards the subject. The students should be motivated through persuasion, use of reinforcements, provision of learning resources and improving on teacher support which cuts across the home and the school environments.
- The learners should be able to understand the need for a commitment to be fully engaged and to be willing to embrace logic behind every success in Biology so as to acquire the necessary knowledge and skills for examinations.

Applications of Wearable Technology in Healthcare

Eng. Rami T. Dalabeeh, Eng. Waseem B. Al-hawari

Royal Medical Services – Amman- Jordan

Abstract: *Recently, wearable technology is utilized to observe and supervise a patient's health. These devices are in close contact with the patient. So, it may be used to acquire data in the form of time series data (i.e. minute-by-minute or second-by-second data) such as heart rate, blood pressure, body temperature and saturation of oxygen in the blood.*

Keywords: *Wearable Technology, Ubiquitous Computing and Cloud Storage.*

DOI: 10.29322/IJSRP.9.08.2019.p9254
<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9254>

1. Introduction

The origins of new wearable technology are affected by the restraints to the discernment of ubiquitous computing. In the early 1980s, there was the first wearable device which was the hearing aid. A little while later, the calculator watch invaded the markets and it was vastly adopted [1, 2]. After its invention, wearable devices have gone through eighteen generations of improvements, with research going on at prestigious institutions such as MIT, Georgia Tech and Carnegie Mello University. In 1997, the first PhD was completed from MIT in wearable technology. Recent reports illustrate that the universal market for wearable technology in the medical field will accomplish more than twelve billion dollars. In fact, the United States of America is considered the most enormous market in the whole world [3, 4].

Researchers sometimes intended to call wearable devices as body-borne computers. This is because these devices can be worn by the user without punching keys or other manipulations. These devices have some important features such as it is always on, it is always working, perform calculations and process information. In fact, wearable devices consist of two main parts. The first part consists of sensors, glasses, watches and even wearable foot. The second part consists of information aggregator and analyzer [5].

Wearable technology offers multiple modern options like multimedia, Bluetooth, Wi-Fi, cameras and Samsung Galaxy Gear Watch. Besides, there are smart glasses which brings technology to our vision such as Google Glasses. Recently, a revolution has made on interactive clothing. These clothing can supply doctors and sports trainers with the real-time health status of the wearer such as Hexoskin [6].

2. Forces Driving the Growth of Wearable Technology

Indeed, there are some reasons that drive the excessive revolution of wearable devices like

- i. Cloud storage: cloud storage services exceeded 2 billion by 2014. Hence, this extensive storage capacity enables the wearable devices to get significant benefits from the cloud as well as sending time series signals and parameters to the cloud. The cloud storage also enables to present and perform reduced information technology (IT) costs. Also, the cloud enables the opportunities to get key advantages of the new technology named the Internet of Things (IoT) [7].
- ii. Faster, cheaper and smaller hardware: wearable technology gets advantages from the golden rule in electronics which illustrates that electronic chips are getting 100 times smaller each decade. Thus, devices based on this technology can be worn easily and held in pockets readily. These features qualify these devices to be used in military fields and in spy era. Recent studies report that by 2020, batteries are expected to be 2.2 times more powerful.
- iii. Location data: wearable devices can provide the medical team with its user's location implicitly. This technology has a device-based location service (i.e. GPS). Besides, it has some up-to-date operating systems (OSs) such as Android, Blackberry OS, Windows Mobile and Symbian S60 [8].

3. Fast-Evolving Gadgets in Fitness, Wellness and Healthcare

Wearable devices in healthcare can be used to measure different parameters such as calories burned, steps walked, issue of definite biochemicals, time spent exercising as well as time spent sleeping. The aforementioned parameters and other parameters can be composed in a particular unit such as activity tracker and smartwatch. Wearable devices can be utilized in some significant fields in healthcare such as determining the percentage of alcohol in blood especially for the drivers, determining the performance of athletics, measuring and supervising the degree of illness for a patient and monitoring of patients with heart diseases especially those with old ages and live alone in faraway places. Here are some applications of wearable devices in healthcare [9]. Figure (1) bellow illustrates the use of smart watch to monitor the heart rate. This application is very useful in fitness field as well as it has many benefits in training aerobically and understanding the heart rate vital sign.

Fig 1: Fitness & Heart Rate Monitor

Figure (2) below shows a new wearable device called fuel band. This device has the ability to track and measure everyday movements.

Fig 2: Fuel Band

Another fruitful application is the wearable device used for continuous glucose monitoring. This device is very helpful to patients who suffer from unbalanced levels of glucose in the blood [10]. Figure 3 below illustrates this technology which can monitor retrospectively review patients' glucose.

Fig 3: Continuous Glucose Monitoring

Some patients suffer from sleep apnea. It is considered impractical to connect the patient to a patient monitor while sleeping. Wearable technology provides a practical solution for these patients [11]. Figure (4) below shows this wearable technology.

Fig 4: Sleep Sensor

There are some significant modifications that transform the way we experience the world. In fact, one of these wearable devices that makes revolution in the medical field is the invention of sensory fitness socks. Some patients suffer from ischemia (i.e. a little blood supply to foot, hands and other organs). These wearable devices have sensors that can communicate with Bluetooth-powered anklet [12]. Then, feeding all data to the user's smartphone. Figure (5) illustrates sensory fitness socks

Fig 5: Sensory Fitness Socks

4. The Future of Wearable Technology

These revolutionary applications are not the end road of this technology. There are promising applications associated with this technology. Recently, Google announced that it released a Software Development Kit (SDK) which can be applied for Android-powered wearables. Moreover, another well-known trademark which is Looxcie. Looxcie has released a live streaming wearable headset with live-feed access from a proprietary tablet and smartphone. There are also devices invaded babies' world. Sensible baby is a wearable device that fits into a chest pocket and sends information and active alerts about temperature, baby orientation and breathing to a parent's mobile device.

Recently, MIT labs invented a wearable device that simulates science fiction. Sensory Fiction is the new wearable device in which the reader can soon experience physical sensation while reading the written words. Moreover, the medical field does not stop receiving modern technology in wearable devices. Smart Contact Lenses is a new wearable technology which can help measure glucose levels in tears [13].

The international theme parks receive a large number of visitors on a daily basis. Some of these visitors are not free of problems and attempts to sabotage. Disney's MyMagie+ is capable of monitoring visitors and collecting data about their behaviours in Disney World theme parks.

5. A Few Hidden Limitations

There are some limitations and restrictions associated with this technology such as

- i. Less versatile
- ii. Small in size

- iii. Ambient noise
- iv. Not as widely accepted
- v. Expensive
- vi. A lot of wirings at times
- vii. Heat emission may cause irritation
- viii. Some side effects such as headaches
- ix. Data security threats especially when the device is lost or stolen

6. Conclusions

Without a doubt, wearable technology will be the most prevailing topics in the upcoming years. Wearable devices will continue to reign in popularity. However, focuses needed on better designs for mass appeals. Moreover, future projections seem to be reaching to the highest level. This revolutionary technology will integrate more seamlessly into daily life.

Major Aspects for Ultrasound Equipment in Medical Applications

Eng. Shadi O. Alnajdawi

Royal Medical Services, Amman – Jordan

Abstract: this medical device is one of the most important radiology devices used to diagnose patients. This machine is utilized to generate an image of interior body structures and endeavor to discover a cause of an illness or to eliminate pathology. Compared to other prevalent processes of medical imaging, ultrasound has a key advantage which is providing images in real-time.

Keywords: Echo, Sound Wave, Ultrasound and Transducer.

DOI: 10.29322/IJSRP.9.08.2019.p9255

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9255>

1. Introduction

Before the middle of the last century, specifically in 1940, the American scientist Floyd was able to invent the first ultrasonic echo imaging equipment [1]. It was first used to reveal interior flaws in the mineral casting. Shortly thereafter, this technique entered the medical field [2]. The first physician who used the ultrasound waves in diagnosing human structures was John Wild. He used the ultrasound waves to estimate the density of bowel tissue. Not only this, but he was also known as the father of medical ultrasound [3].

The working principle for the ultrasound equipment is represented in 3 phenomena. The first step is generating a sound wave, then drawing the echoes and the last step is interpreting the echoes.

- i. Generating a sound wave: A piezoelectric transducer is a chip responsible for producing a sound wave. This transducer is masked in a plastic covering. Then, electrical pulses lead the transducer at the required frequency. Moreover, modern approaches of transducers utilize phased array technologies to qualify the equipment to alter the tendency and depth of focus. Here, the sound wave is converged by two techniques. The first technique is the form of the transducer. The other technique is the complicated series of control pulses from the scanner. In fact, the sound waves move to the structure of the body and focuses on a required depth [4].
- ii. Drawing the echoes: In this step, the returning sound wave from the body vibrates the transducer. This will generate electrical pulses that move into the scanner which will be responsible for processing and converting the electrical pulses into a digital image [5].
- iii. Interpreting the echoes: In this stage, two principles should be determined by the ultrasound scanner. The first principle is determining the time that requires the sound wave to be produced and returned as an echo wave. The second principle is determining the strength of the echo wave. After determining these two principles, then, the ultrasonic scanner enables to determine the location of the pixel in the image to ignite as well as its intensity [6].

2. Working Principle

Indeed, the density depth depends highly on the media that the electrical pulses pass through. However, if the electrical pulses strike either gases or solids, then, the density difference will be considerable. Hence, a large amount of acoustic energy is reflected which will lead to difficulty on discovering deeper. The promptness of sound waves differs when it moves through various media. This velocity depends mainly on the acoustical impedance of the media. Besides, the sonographic tool proposes that the acoustic speed is fixed at 1540 meter per second. This proposition affects the body with non-uniform structures where the ray turns into a little de-focused as well as the resolution of the image is decreased [7, 8].

For producing a two-dimensional image, the ultrasonic waves are swept. There are two approaches to sweep the transducer which is either mechanically or electronically. The obtained data is addressed and utilized to structure the image. This image is after that a two-dimensional performance of the interior structure of the real body. In fact, three-dimensional images might be produced via obtaining a sequence of contiguous two-dimensional images.

Besides two-dimensional images and three-dimensional images, there is also Doppler ultrasounds which are utilized to address the flowing of blood and the movement of muscles. Here, the various received velocities are performed in color owing to easiness of performance. Colors might alternately be utilized to illustrate the capacities of the received echoes.

3. Modes of Ultrasound

There are different modes of ultrasound utilized in medical imaging such as

- i. A-mode: The letter "A" here is the abbreviation of amplitude. In fact, the amplitude of the reflected wave is demonstrated on an oscilloscope display. This mode is considered the plainest kind of ultrasounds. Here, a singular transducer scans a line over the body with the waves represented on screen as a representation of depth. An example of this mode is the therapeutic ultrasound that targeted at a precise tumor [9, 10]. Figure (1) below illustrates the A-mode

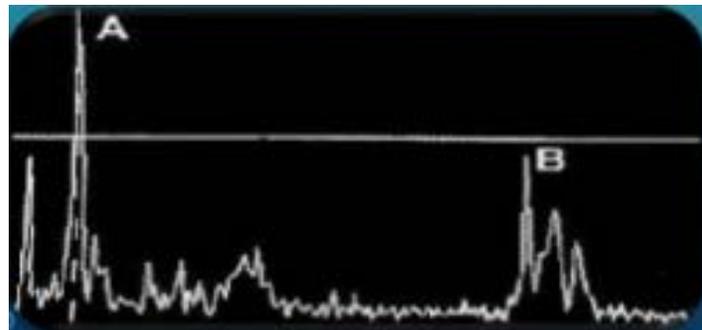

Fig1: A-Mode

- ii. B-Mode: The letter "B" here is the abbreviation of brightness. Indeed, a linear array of transducers altogether scans a scale over the body which can be examined as a two-dimensional image on the monitor. So, it is sometimes called a 2D-mode. This mode is considered an important imaging modality in the diagnostic ultrasound. An amplitude of the received ultrasound signal is transformed into a gray scale image [11, 12]. Figure (2) below shows the B-mode.

Fig (2): B-Mode

- iii. D-Mode: The letter "D" here is the abbreviation of Doppler. This type of modes is based on Doppler's effect. The modification in frequency is triggered by the mutual activities of sound generator and the observer. There are different types of this mode such as color Doppler, Continuous Wave (CW) Doppler and Pulsed Wave (PW) Doppler [12]. Figure (3) below illustrates the D-mode

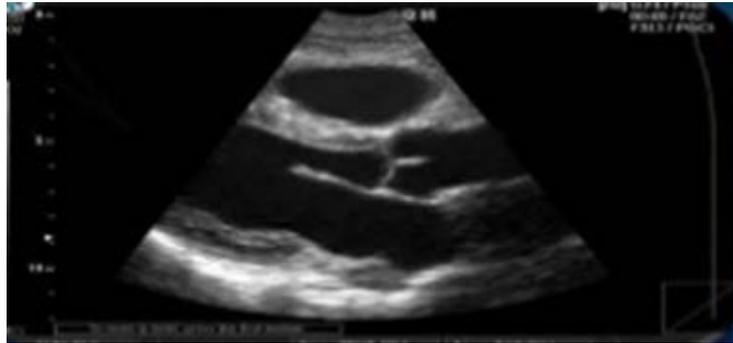

Fig 3: D-Mode

- iv. M-Mode: The letter "M" here is the abbreviation of motion. This mode imitates the movement of the organ's structure such as the heart over time because of its outstanding chronological resolution. It is considered the most precise mode among all. After a while, this is equivalent to recording a video in ultrasound [13]. Figure (4) illustrates the M-mode

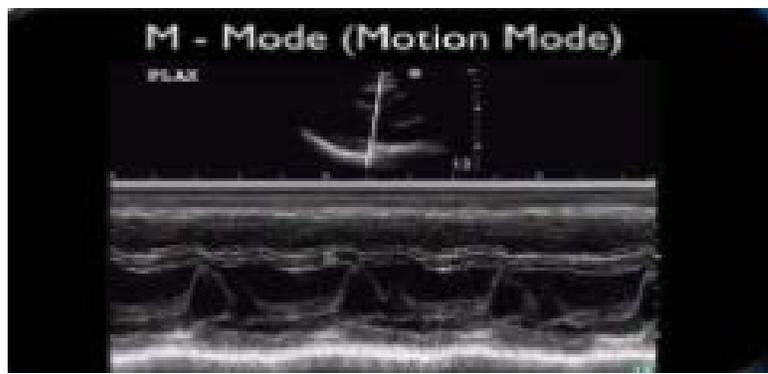

Fig (4): M-Mode

4. Maintenance, Safety and Precautions

Many biomedical engineers' advice physicians that frequently use ultrasound machines to properly calibrate the equipment after every six months. They also requesting from them to clean all external surfaces and filters. Besides, they also inform the technicians and the operators to frequently check system and power supply fans. They also advice technicians to look over system controls, power cords and cables for crack, cuts and wear [14].

Having considered some rules in preventive maintenance of ultrasound machines, it is also reasonable to look at some steps associated with safety and precautions. One of the important rules in this manner is the aim of reducing the potential of adverse events, so that the operator has to utilize least exposure to accomplish anticipated reimbursements. Moreover, the physician should care about the transducer position. It should be at an angel of 90' during use and has to gradually transfer with the purpose of reducing the hazard of triggering hot spots [15].

Another advice associated with ultrasound is to disconnect the probe when the patient feel of any pain during diagnosing. The reason behind this cause is that the overheat of tissue.

5. Conclusions

The ultrasound machine is considered a safe and painless equipment. It can image muscles, soft tissues and bone surfaces perfectly and is predominantly convenient for allocating the boundaries among hard and fluid-filled spaces. Ultrasound machine extracts "live" images, where the physician enables to animatedly chose the most valuable subdivision for identifying and authenticating variations, frequently permitting prompt diagnoses. Live images similarly permit ultrasound-

channelled operations or injections, that might be burdensome with other imaging modalities. Moreover, ultrasound machines can illustrate the composition of organs.

The Role of Using Concussion Detection Sensors in Healthcare Management

Eng. Mohamed F. Ababeneh, Eng. Ahmad M. Al-mbydeen, Eng. Alaa O. Suleiman, Eng. Ahmad A. Alslaihat

Royal Medical Services, Amman – Jordan

DOI: 10.29322/IJSRP.9.08.2019.p9256
<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9256>

Abstract: Concussion is a critical brain condition which may lead to temporary loss brain function. Commonly, it is related to sport activity and accidents where around 57 million people around the world suffering from traumatic brain injury. Application of sensors technology promotes early detection of concussion and playing a significant role in clinical diagnosis and management. As well as, telemedicine provides a smart solution for detection and management of Concussion over remote area.

Keywords: Concussion sensor, Concussion detection and management, Telemedicine, Connected Health.

Introduction

Concussion is one of the most critical brain injury commonly related to sports activities. Also, it can be resulted from vehicle accidents affecting part of the community. High ratio of concussion injuries among all ages found in young children participated in sport activities due to the disproportionately of their heads are large compared to their growing body at this certain age. On the other hand, Large ratio of people who are suffering from concussion don't experience and recognize any indicators or symptoms. Making the detection of concussion is crucial and require special care to diagnoses and management. Impact of technology into the healthcare services provide a great promoting solution to early detection of concussion. As same as, improve and develop diagnosis techniques and management solutions based on telemedicine and smart technology. Therefore, in this review I would discuss the potential using of sensor and medical devices to detect signals and data required to diagnose concussion and explore commercial systems that are used to support and manage patients.

Definition and overview

Concussion can be defined as a complex of pathological conditions affecting the brain leading to traumatic brain injury with temporary loss of functions by direct blow to head or by impulsive force shaking the head and upper part of the body causing temporary neurological impairment including physical (e.g., headaches, nausea), cognitive (e.g., difficulty with concentration or memory), emotional (e.g., irritability, sadness), and maintenance (e.g., sleep disturbances, changes in appetite or energy levels) symptoms. Sport and physical activities are responsible for more than 15% of head and spinal cord injuries, as the popularity of sport rises it is suggested to increase the incident of sport related injuries (McCrorry et al. 2009). Human brain protected by skull bone and surrounded by cerebrospinal fluid functioning as shock absorber for small blow forces. Acceleration and deceleration of head can cause a concussion when the brain bump to the anterior part of the skull as a reaction to the impact force. While in the case of deceleration the brain hits the opposite side of the skull. Rotational movement of the brain inside calvaria producing shear forces that establish torque leading to concussion.

Symptoms and indicators of concussion are divided into temporary and delayed signs; the common temporary symptoms headaches or feeling of pressure, dazed feeling, confusion, vomiting and loss of memory (amnesia). Other types of symptoms may be delayed for hours or days after injury such as sensitivity to light and noise, sleep disturbance and concentration complaints. Moreover, researches (Daneshvar et al. 2011) exposed that a relation between concussion and long term effects may lasting decades certainly for patients with previous treated concussion. A recent study showed that after three decades of concussion injured athletes had medical indicators and symptoms comparable to patients with early Parkinson disease (MNT, 2013).

More than 57 million people around the world suffering from traumatic brain injury, with 10 million need to hospital admission. In the United States of America around 1.7 million people had experience the concussion every year, making 275.000 patients at hospital and about 52.000 deaths. In the last decade, the incident of concussion increased significantly resulting economic impact to the healthcare sector around more than 15 billion regarding the medical treatment and hospitalization cost and the expenses of lost productivity. It is estimated that concussion related to sport and physical activities is most common to occur in young children due to

their heads are disproportionately large compared to their bodies. The second reason for concussion in young children is football sport where more than 250,000 of children in USA experienced the concussion annually (Kimblor et al. 2012).

Required patient data to detect/diagnose/manage concussion

Concussion detection and management need precise recognition of patient's previous exposure history of concussion and their family medical history too. Patient baseline concussion test is helpful to measure reaction time, memory, speed of mental functioning and decision making processing, recording all these data of each participant over the sport season. Performing this test again in case of concussion presence to establish some comparative scores of studies before and after the injury.

A landmark study achieved by Levin and his team showed that neurophysiological (NP) assessment of concussion in sport designed the foundation of current management system of concussion. Where the recovered concussion participants were examined by neurophysiological (NP) test battery paper pencil tasks showed a significant decrease in neurocognitive functioning after injury had occurred compared with first baseline test (Levin et al. 1989).

The application of neurophysiological examination contains a clinical data and valuable information in concussion assessment. Evaluation of concussion based on neurophysiological indicators including cranial nerve, visual acuity monitoring, muscles strength and reflexes and test balance. Visual activity screening involves the assessment of pupil's response and eye movement to detect any abnormality of eye response or sudden change in visual field. Balance test system is beneficial tool of neurophysiological measurement to assist acute postural stability deficits, brain functioning and valid and reliable addition; certainly, when the symptoms show balance irregularities. Indeed, Balance Error Scoring System (BESS) is commonly used simple technique to evaluate athletes balance capability after brain injury to make decision for play return. More advanced test that can be performed to evaluate balance abnormality is Sensory Organization Test (SOT) by quantifying sways of patient while standing in fixed point using six conditions to identify balance disorder, three of six conditions are related to postural control: somatosensory, visual, and vestibular. SOT can detect balance abnormality during 30 days after injury comparing with 3 days for BESS.

In addition to that, several types of electrophysiological recording methods such as evoked response potential can provide significant clinical information about short and long term of concussion regarding the visual abnormality symptoms (Pillai & Gittinger 2016). Concussion is frequently associated with abnormalities of saccades (Molloy et al. 2017) demonstrated that King-Devick test as rapid visual valuable measure that can be used on sidelines by nonmedical personnel, including parents of youth athletes to improve the potential of concussion detection in sport. Other studies showed the impact of computerized cognitive evaluation test and batteries based test offering a solution for practical problem. (Collie et al. 2001) presented the role of Computerized test designed primary to investigate patients with neurological and brain lesion while the batteries based test modulated for computer presentation and recording such as Cambridge Neuropsychological Test Automated Battery (CANTAB) (Robbins et al 1994). Also, Cognitive tests are needed to detect deficits result in various brain functions such as Wechsler Digit Span Test, Wechsler Letter Number Sequencing Test and Stroop Color Word Test (Maroon et al. 2000).

More over Fluid biomarkers can be useful to detect mild traumatic brain injury and related conditions, Zetterberg and Blennow conclude that the valuable fluid biomarkers are associated neuronal and blood brain barrier injury and neuroinflammation. The capability of fluid biomarker depends on sampling time to quantify brain damage or concussion should be taken as soon as possible after the injury. While bio indicators fluid for delay effects such as neuroinflammation should reach suitable concentration after days or week after trauma. However, limitation for Fluid biomarkers are still under investigation and improvement to establish reference standards for neuropathology to create the diagnosis (Zetterberg & Blennow et al 2016).

Recently medical imaging system play an important role in clinical assessment and classification of brain abnormality. Typical imaging techniques such as X Ray, Computed Topography or Magnetic Resonance Image are not satisfied enough to prove diagnoses of concussion separately. Therefore, more advance imaging technique based on molecular imaging to investigate brain function via measurement of glucose consumption and metabolism activities shows a promotion outcomes when Positron Emission Tomography (PET) integrate with MRI and diagnostic software may be recommended to examine the changes directly after traumatic brain injury and detect any complications could be occurred (Byrnes et al. 2014).

Commercial systems on the market for concussion management

Integrated concussion examination X2 ICE is a useful smart tool based on tablet device combined with windows and iOS software to manage and evaluate player during sport activities to make a decision about suspected athletes using the principle of comparing base line information with after injury signs. X2 ICE system allow the facility to store and match all examination data with previous collected data for the player. Several examination modules are embedded in the system to support short and long term memory test, balance test, cognitive and baseline matching. Furthermore, X2 ICE system is accessible anytime and anywhere due to the possibility to upload collected data to a cloud (Biosystem X2 ICE 2017).

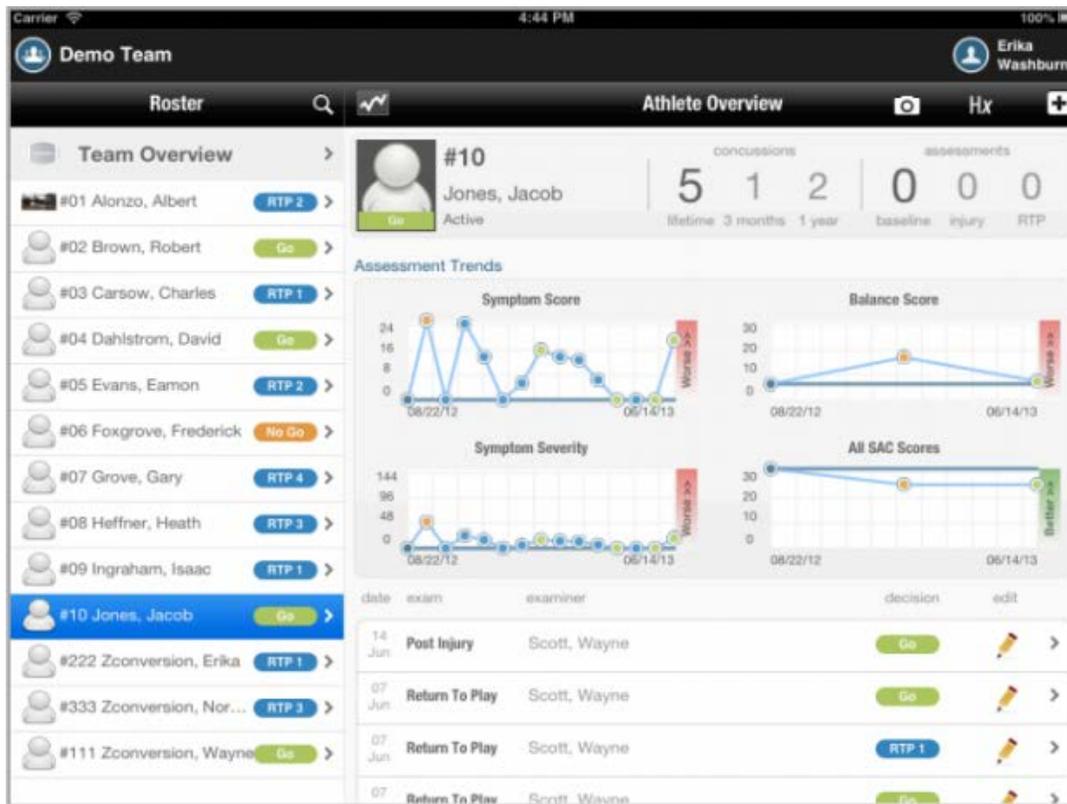

Figure 1: Biosys X2 ICE concussion examination system (Biosystem X2 ICE 2017).

In 2005 researches have demonstrated that measurement of angular and linear acceleration lead to more precise prediction of concussion (Yoganandan et al. 2005). While others were interested to specify the ideal location to position the accelerator sensor, (King et al. 2014) explained the superiority of mouth guard positioning. Therefore, Leading Force impact technology company introduce a digital mouth piece called X2IMPACT Guard to solve the problem with players who are return to play while they are still under high probability of brain traumatic injury. X2IMPACT Guard consider as smart device that can measure and store the impact forces affecting inside the head. All collected data can be send to sideline where X2IMPACT application allow direct access to concussion data including previous medical information of players. The clinical of the team assist the real-time concussion data and make a decision to allow participant to return or no.

Head Impact Telemetry (HIS) system is a unique device to measure and record the acceleration of exposure head in real time. Riddell Insite is a commercial impact response system uses during Americans football games, it is based on five accelerator sensors distributed inside the helmet with decoder and transmitter hardware, and interference software compatible with PC and smart phones to access the impact information. HIS integrated with computational algorithms to process data with wireless transmitter to establish real time continuous monitoring data, transmitted directly to a receptor inform of PC or smart phone to correlate the relation between head acceleration and concussion in sport. Software application support the smart phones and computer to record the participant’s history, baseline data, environmental setting and impact threshold.

Figure 2: Riddell Insite Impact Response System (Riddell 2017)

Ongoing research on devices

Biodirection company performs researches and studies to investigate world first nanowire biosensing platform for concussion and other types of traumatic brain injury based on rapid detection of biomarkers in blood. Tbit device will be able to detect blood protein bioindicator released in bloodstream immediately after TBI within short time around 90 seconds and low cost. As well as that Tbit is point of care platform providing the ability to be portable detection system for TBI. Biodirection company declared that they are still in the middle of clinical researches to prove data needed to be submitted with Food and Drug Administration (Biodirection 2017).

United states company called BrianScop is granted \$28 million from department of defense to establish a wearable EEG portable machine to detect electrical brain activity via smartphones. The device suggested to use algorithm allowing comprehensive outcomes panels. Clinicians and researchers require to concentrate on developing multi-modular assessment platform that explain deficits inhibiting an individual's physical activity. Studying is ongoing phase to specify suit of measure to deliver the most medical related information.

Regulations and guidelines of sport related concussion

Many researches and studies achieved over several years to establish and develop regulations, strategies and laws that managing the sport activities to ensure prevention or at least reduce the possibility of brain injuries. Rules and guidelines for sport related concussion can be summarized into three main points.

High level of awareness and understanding of concussion by coaches, athletes and team medical staff. Significantly the symptoms and medical indicators pointed to concussion, first aid medical procedures to reduce the effect of injuries and protect patient. Applying a plan of proactive regulation to prevent and reduces the brain injuries. Specialized training and education in parallel with brochure and short reports will increase the recognition of all condition related to sport concussion. Currently, social media and on line training courses are widely speared and accessible all around the world, thus could participate significantly to build the knowledge and awareness (CATT 2017).

The 4th International Conference on Concussion in Sport held in Zurich, November 2012 focused on the rules and regulation to decide the return of athletes to play again. The decision should be taken by and certified medical expert after looking for recommended protocol including several medical procedures and test such as cognitive and physical rest is needed to allow for recovery before playing again. Moreover, in case of concussion occurrence, short and simple physical exercises should be applying in the first steps of rehabilitation procedures, then progress to an intermediate and fully practices should be covered under the supervision of specialized medical team. However, the allowance to return to play should be provided with medical clearance (Kimble et al. 2012).

Finally, in many countries around the world parent's acceptance to allow their child to participate are compulsory, also concussion training courses for formal coaches are imposed by law. During the game, it is emergence need to take any player with suspected injury out of the playing area and provide the suitable medical care. Playing rules and laws modified by some countries to prevent, diagnose, and early detect players with suggested concussion, some colleges and sport league adopt additional strategies and policies

including; build up a plane including information needed to call emergency medical centers, and to follow several procedures in case of emergency. As possible as can reduce the contact between players by changing and modifying playing rules and assure the safety equipment as recommended by manufacturers (Institute of Medicine 2013).

Connected health for management of concussion

The management of patients after concussion injuries or people a high risk of suspected to traumatic brain injury faces several limitations and problems. Firstly, lack of specialized clinicians who can work with this situation, due to the fact that most sport facilities are spread widely into the countries with huge number of participants, making it difficult to enroll at least one specialist for each facility. Another problem is the failure of people in certain location such as country side or isolated places to access medical services. Connected health solution could have the ability to solve such problem or reduces the side effects of particular limitations.

Continuous educational system offers a significant opportunity for athletes, coaches, parents and medical staff to update their information with the latest results from researches and studies in the field. Portable and Web education resources such as brochure or online training tools will improve the education and reduce the gap between non-medical person who involved concussion risks. Questioner forms or survey will help involved person to record and report the information when concussion incident by answering several questions related to the place and strength of blow, and addressing symptoms and signs. As a result, if the concussion is suspected, the mobile education tool will order to follow certain recommendations and instructions to deal with concussion temporary until the emergency team arrive. On the other hand, some smart applications allow the user to connected to specialist medical staff who can support the patient situation based on obtained information and provide required instruction and recommendations to guarantee the dealing quality with patient case. This type of application is useful in rural and isolated geographical places (Lee et al. 2014).

Nowadays remote medical sensors and devices are useful to evaluation, diagnoses and management of concussion. (Yoganandan et al. 2005) explore that 47% of athletes are playing without recognition the risk of concussion incident. Therefore, it is recommended to wear safety and protective equipment with novel sensor technology that allow early detection of concussion. A good example of safety tool and remote detection equipment is smart helmet. It contains set of biosensor that detect blow forces. When the detected force exceeds a preset threshold value of force, LEDs and alarm system immediately notify the responsible person via wireless or Bluetooth technology at smart phone as receiver which include an application to detect the possibility of injury automatically based on the transmitted value of force hit the player. It also improves the existing technology by calculating the magnitude of the hit, in order to take instant serious measures, allowing specialist medical staff to explain patient information including patient history, severity of injury, signs and symptoms, etc. this medical expert can also contact the patient remotely to detect the suspected injury and transmits patient data to a central database bank (Veena et al. 2014).

Challenges with concussion connected health solution

There are many interests and challenges regarding using the connected health in the management of concussion. Recognizing and assessment of concussion within player on the field is a challenging procedure and responsibility for the medical care provider. Achieving this task requires rapid assessment according to standard objective evaluation of injury. Specialist medical staff considers as the main point in the management of concussion in the field, consulting education and training is major difficulties for healthcare provider due to the high cost of training and education in this field. More over this desired training and education is time consuming regarding to several related conditions and details that must be covered to achieve certain level of medical support. On the other hand, the connected health care system based on using internet and wireless signal in data transmitting may lead to break the privacy and confidentiality of patient's information.

Conclusion

Finally, telemedicine is a significant tool to manage, detection and diagnose concussion in parallel with smart phones applications and biosensors. Incorporating biosensors with safety equipment and tools in sport lead to early detection of concussion by measuring the hit force or both types of acceleration allowing health care specialist to proceed remotely tests and evaluation of concussion over internet connection or mobile signal allowing to early detect of injury even at isolated places. In addition to that, smart solution and application provide a great opportunity to develop and improve the management and treatment of concussion patients and help clinical to make correct decision of return to play. Consequently, good management, correct decision and early detection of concussion are fundamental for rapid recovery and relieve the effects of concussion.

Abstract- Aim of this study was to differentiate the benign and malignant tumors according to the density values within the tumors. This study was based on the preprocessed mammograms obtained from the DBT machine and to calculate the density value by using matlab. Effects of breast thickness and age of the patient also considered. Craniocaudal (CC) and Mediolateral Oblique (MLO) views of Mammograms were collected by using data base of Digital Breast Tomosynthesis system. Already reported 48 images were collected and assess the density of the tumor by measuring of pixel values within the benign and malignant lesion. customized MATLAB programme. According to the quantitative analysis there was a significance difference between mean pixel value of the tumor in both CC and MLO views among benign and malignant group ($P < 0.05$). And it was evident there was a strong positive linear regression between Pixel value of the tumor and the age of the patient. But there was no significant relationship between pixel value of the tumor, and the thickness of the breast in both views. Study was concluded that the pixel value of the tumor can be used to differentiate benign and malignant breast tumors. According to the discriminant analysis sensitivity was less in CC than MLO images. Therefore less percentage of false negative was reported in MLO view images. Specificity was high in both CC and MLO view images. Therefore few percentage of false positive was reported.

Index Terms- Mammography, Digital breast tomosynthesis, Pixel value

I. INTRODUCTION

Digital Breast Tomosynthesis (DBT) also known as 3-Dimensional (3-D) is recent technical improvement in mammography. Digital breast tomosynthesis aids the early detection and accurate diagnosis of breast diseases^[1]. Conventional mammography examination is 2-dimensional and two x-ray images are taken of the breast. In mammography breast is compressed in order to produce breast images. But it may cause overlapping of the breast tissue. Therefore abnormal tissue can be hidden^[2]. Tomosynthesis producing the images by moving x-ray tube in an arc over the compressed breast and captured multiple 3-D images as well as 2-dimensional fulfilled digital images (2-D FFDM). These 3-D images clearly distinguish the normal breast tissues from the abnormal breast tissue^[3].

Breast masses mainly categorized in to benign and malignant. Mammograms clearly reveal breast lesions which may not be clinically palpable. Breast mass has a volume & it occupies space within the breast. The tissues within the breast mass different from the other areas of the breast^[4]. Most of breast tumors are benign such as fibrocystic changes, fibroadenoma, papilloma. Malignant breast tumors having different characteristics from benign tumors. These malignant tumors should be detected and treated early to avoid the metastasis^[5].

An accurate diagnosis of breast lesions is required for optimal treatment Mammography has become important in breast imaging up to date. But not all the cancers can be detected by Mammography^[6]. There are some factors which lower the sensitivity of Mammogram include technical & interpretative errors, rapid tumor growth patterns and extensive mammographic breast density. Hence it will obscure the lesion detection^[3]. Breast density changes with the age of the women and other reason such as hormone replacement therapy (HRT). Mammographic density is higher among younger, premenopausal women.

As a clinical imaging modality DBT improve the detection of breast lesions in women with dense breast. It enables the acquisition of three dimensional images (3D-images) of the breast and it creates sequential thin images through breast^[7]. DBT overcomes the limitations caused by overlapping tissues during standard two dimensional imaging (2D-Imaging) in conventional mammography. It is allowing the visualization of breast lesions which are not appears in 2D conventional mammography^[2].

DBT gives potential advantage of evaluation of masses and other pathologies associated with breast with its advanced technology compared to 2D conventional mammography. Therefore in this study, evaluating the lesion morphology on DBT to distinguish between malignant and benign tumors of the breast by using digital image processing^[8].

II. JUSTIFICATION

Breast cancer is currently considered the most common cancer among women. Early and accurate diagnosis may benefit to provide successful treatment for the patient. In all over the world mammography plays a major role in screening of breast cancer as it detects breast cancers at their early stage. But mammography show low sensitivity when patient is having dense breast. Digital breast tomosynthesis overcomes the limitations occurred with conventional mammography and improve the detection of breast lesions in women with dense breast.

Density is the one of the main feature of differentiation of malignant and benign lesions. In this study, mainly measure the density values within the lesion quantitatively. In order to suggest a range of density value for malignant and benign lesion respectively.

III. RESULTS

The study sample was included DBT images from 48 patients. Data was collected through machine storage with no inconvenience to hospital setup. DBT images of Patients who have already diagnosed as malignant and benign lesion.

Images were stored in MATLAB and display as grayscale image. All the images were preprocessed for visual enhancement. Measurement of pixel values within the benign and malignant lesion was taken from the customized MATLAB application

According to the developed MATLAB programme in this study I have removed the pectoral major muscle and prominent blood vessels within the breast area.

A whole breast area was selected to get the pixel value of normal breast tissue. Pectoral major muscle, prominent blood vessels and tumor area was excluded from the normal breast area. The tumor outline was selected separately. A pixel value was taken for normal breast area and tumor with the help of MATLAB programme. The ratio of the pixel values were taken between tumor and the breast area.

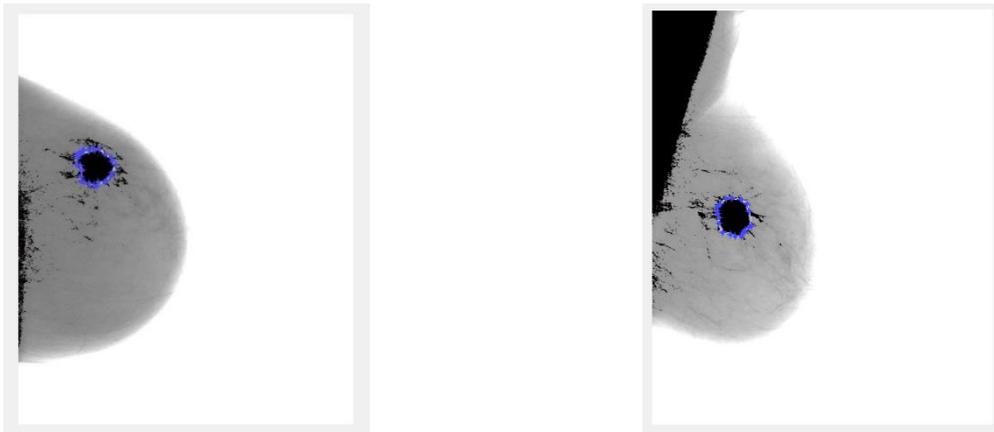

Figure 1: CC & MLO view images with selected tumor

Out of total sample of 48 of patients, there were 28 benign tumor images and 20 malignant tumors.

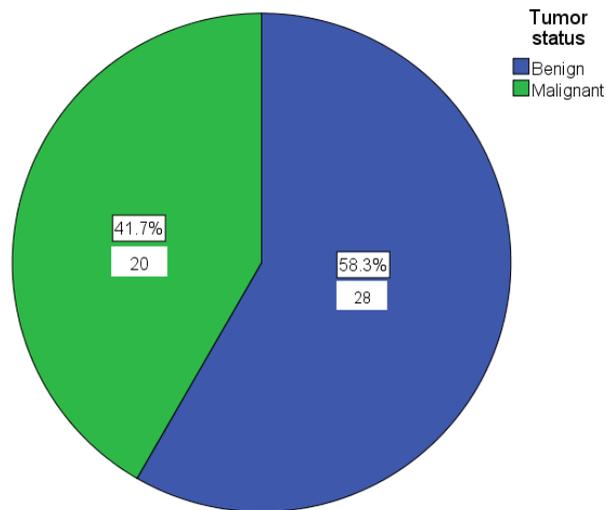

Figure 2: Distribution of tumor status of total sample population

Table 1: Descriptive statistics of the explanatory variables: Craniocauded view

	N	Range	Minimum	Maximum	Mean	Std. Deviation
pixel value of the tumor	48	2234.08	1249.28	3483.36	2458.53	412.13
pixel value of the breast	48	566.88	742.65	1309.54	1071.30	137.56
ratio of the pixel value	48	2.59	1.04	3.64	2.34	0.52

mAs	48	314.00	56.00	370.00	178.56	82.87
Age	48	48.00	28.00	76.00	54.92	10.64

Table 2: Descriptive statistics of the pixel value and the pixel value ratio of the benign and malignant tumors: CC view

	Conditions					
	Benign group			Malignant Group		
	Mean ± SD	(Min- Max)	Range	Mean ± SD	(Min- Max)	Range
Pixel value	2344.28 ±451.71	1249.28 - 3483.36	2234.08	2618.33 ±290.03	2067.49 - 2985.27	917.78
Ratio of the pixel value	2.24 ±.55	1.04 - 3.04	1.99	2.48 ±.45	1.83 - 3.64	1.8

Table 3: Summary of independent t-test-CC view

	t-test for equality of means						
	t	df	Sig.(2-tailed)	Mean difference	Std.error difference	95% confidence interval of the difference	
						Lower	Upper
Pixel value of the tumor	-2.380	46	0.021	-273.950	115.080	-505.609	-42.303
Ratio of the pixel value	-1.587	46	0.119	-.238	0.150	-0.540	0.064

Mean pixel value of the tumor in benign group was 2344.38 and range was 2234.08. Mean pixel value of the tumor in malignant group was 2618.33 and range was 917.78 (table 2). Mean value of the tumor in malignant group was higher than that of the benign group. Since P value was 0.021 for the pixel value of the tumor (P<0.05) which indicate there was significant difference in pixel value of the tumor between benign and malignant group for CC view.

When compared ratio of the pixel value in benign and malignant group P value was 0.119 (P>0.05) which indicate there was no significant difference of ratio of the pixel value between benign and malignant group for CC view.

Below scatter plots were created to see the distribution of pixel value of the tumor and pixel value ratio of the tumor with age of the patient and thickness of the breast in CC view.

Table 4: Descriptive statistics of the explanatory variables: MLO view

	N	Range	Minimum	Maximum	Mean	Std. Deviation
pixel value of the tumor	48	1904.87	1288.48	3193.35	2424.64	400.56
pixel value of the breast	48	475.51	889.92	1365.43	1093.27	119.61
ratio of the pixel value	48	1.93	1.26	3.19	2.24	0.46

Table 5: Descriptive statistics of the pixel value and the pixel value ratio of the benign and malignant tumors: MLO view

	Conditions					
	Benign group			Malignant Group		
	Mean ± SD	(Min- Max)	Range	Mean ± SD	(Min- Max)	Range
Pixel value	2322.21 ±80.58	1288.48 - 3125.84	1837.36	2568.05 ±71.21	2102.77 – 3193.35	1090.58
Ratio of the pixel value	2.21 ±.09	1.26 - 3.19	1.93	2.28 ±.08	1.68 - 3.14	1.45

Table 6: Summary of independent t-test-MLO view

	t-test for equality of means						
	t	df	Sig.(2-tailed)	Mean difference	Std.error difference	95% confidence interval of the difference	
						Lower	Upper
Pixel value of the tumor	-2.178	46	0.035	-245.84	112.86	-473.028	-18.659

Ratio of the pixel value (Equal variances not assumed)	-0.554	45.989	0.582	-0.071	0.128	-0.330	0.187
--	--------	--------	-------	--------	-------	--------	-------

Mean pixel value of the tumor in benign group was 2322.21 and range was 1837.36. Mean pixel value of the tumor in malignant group was 2568.05 and range was 1090.58. (table 5) Mean value of the tumor in malignant group was higher than that of the benign group. Since P value was 0.035 for the pixel value of the tumor ($P < 0.05$) which indicate there was significant difference in pixel value of the tumor between benign and malignant group for MLO view.

When compared ratio of the pixel value in benign and malignant group P value was 0.582 ($P > 0.05$) which indicate there was no significant difference of ratio of the pixel value between benign and malignant group for MLO view.

Table 7: Classification results-CC view

Original	Tumor status	Predicted group membership		Total
		Benign	Malignant	
Count	Benign	22	6	28
	Malignant	11	9	20
%	Benign	78.6	21.4	100.0
	Malignant	55.0	45.0	100.0

According to the classification results sensitivity was 45.0% and specificity was 78.6% for CC view

Table 8: Classification results for MLO view

Original	Tumor status	Predicted group membership		Total
		Benign	Malignant	
Count	Benign	22	6	28
	Malignant	9	11	20
%	Benign	78.6	21.4	100.0
	Malignant	45.0	55.0	100.0

According to the classification results sensitivity was 55.0% and specificity was 78.6% for MLO view.

IV. CONCLUSION

The study concluded that quantitative analysis of the pixel value of the tumor is a reliable technique for differential diagnosis of benign and malignant tumor while ratio of the pixel value between tumor and normal breast area not improve the diagnostic performance.

This quantitative measuring of pixel value within the tumor can be used to confirm the radiologist's decision when difficult to diagnose the patient's tumor condition.

Sensitivity was less in CC than MLO images. Therefore less percentage of false negative was reported in MLO view images. Specificity was high in both CC and MLO view images. Therefore few percentage of false positive was reported.

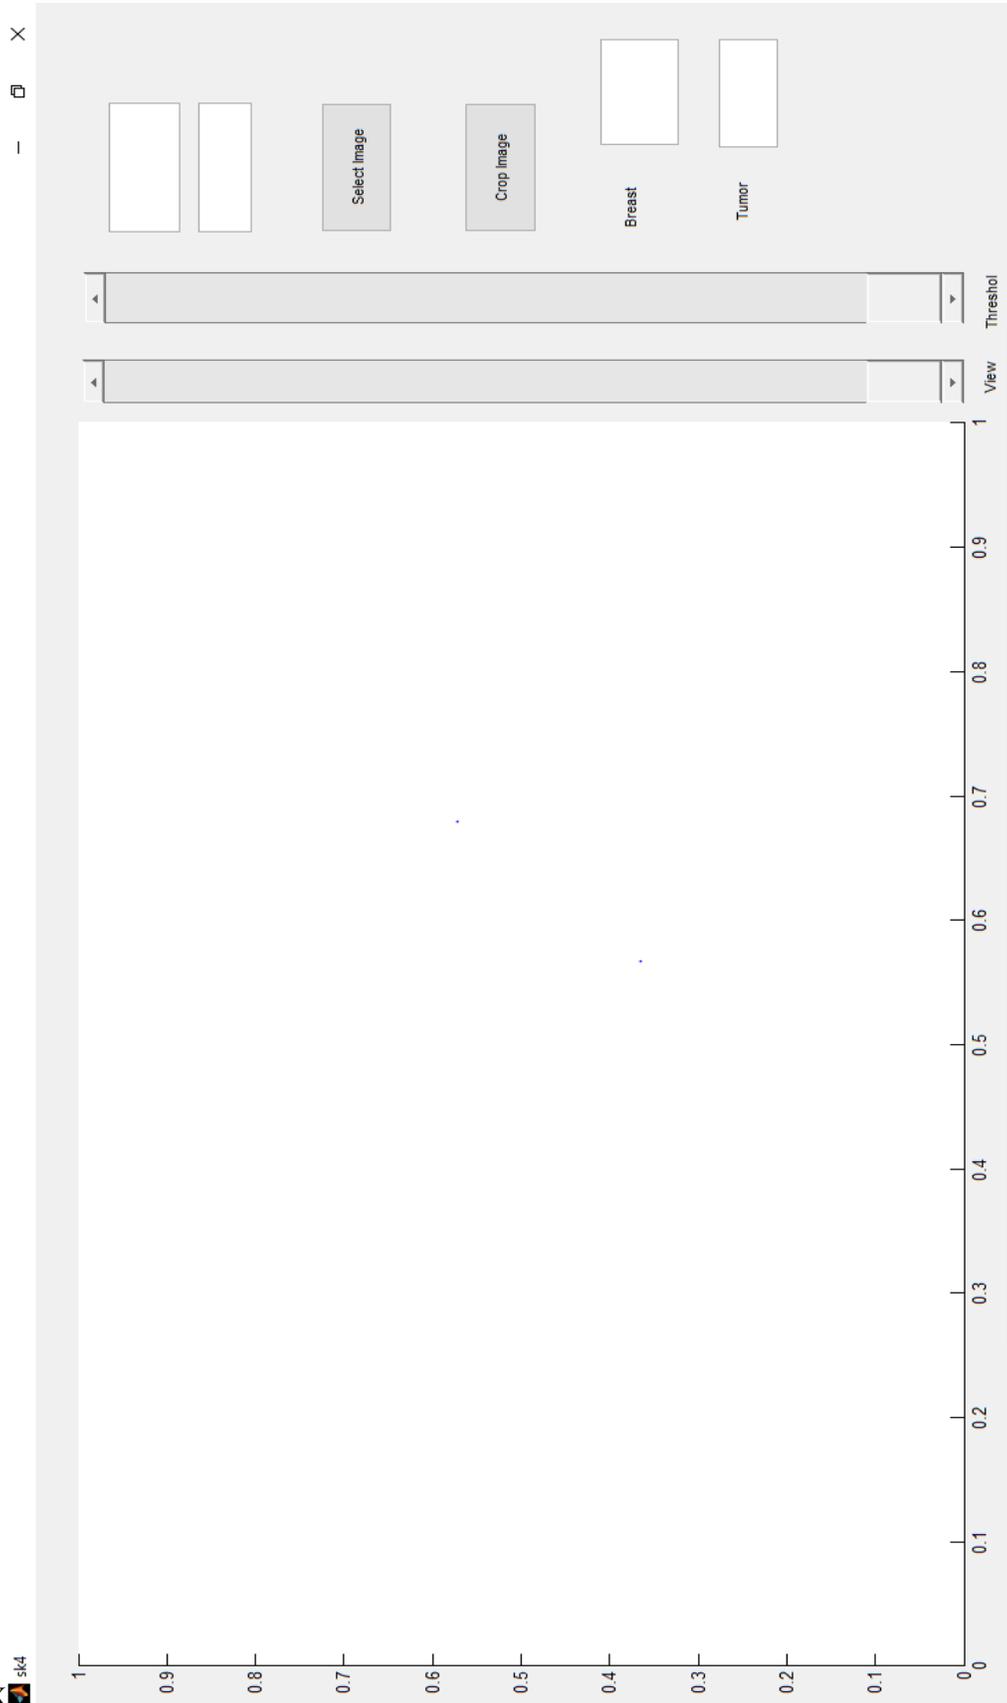

Figure 3: Customized MATLAB application to obtain pixel value

VI. ACKNOWLEDGMENT

I would like to express my deepest gratitude to my supervisor in this study Dr. Janaka P Wansapura, Senior lecturer, Department of Physics, University of Colombo, for accepting me as his student and for his valuable advice, encouragement and guidance throughout my project.

It is my utmost duty to extend my heartiest thanks and gratitude to my Co Supervisor Dr. Gayani Senanayake Senior lecturer, Department of pre-clinical sciences, Faculty of Medicine, General Sir John Kotelawala Defence University for her tremendous dedication, interest and guidance for this research work throughout the study.

My sincere thanks to director, Radiology manager, chief Radiographer and radiographers in mammography unit of data collected hospital for granting permission to carry out this research project.

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9258>

Abstract- Endometrioid Endometrial Carcinoma (EEC) is one of the malignant primary epithelial tumors in the endometrium, a glandular neoplasm that shows acinar, papillary or partially dense configuration and potentially affects the myometrium. Histopathological grading is based on the degree of structural differentiation and cell atypia. BMI is a body mass index calculated by comparing body weight with height, calculated by dividing body weight in kilograms with height in meters squared. The exact cause of EEC is unknown, most of the EEC cases associated with endometrial exposure to chronic estrogen stimulation will cause excessive proliferation resulting in endometrial hyperplasia which is a precursor to the occurrence of EEC. This study used endometrial tissue samples to assess the relationship BMI and histopathological grading of EEC. As many as 31 paraffin blocks fixed by formalin from EEC patients were examined and assessed for histopathological grading. The basic characteristics of the sample are obtained through medical records or pathology archives. the relationship between BMI and histopathological grading EEC was analyzed using SPSS version 22. The results of the analysis showed that there was no significant relationship between BMI and histopathological grading of EEC ($p > 0.05$).

Index Terms- Endometrioid Endometrial Carcinoma (EEC), Body Mass Index (BMI), Grading histopathology

I. INTRODUCTION

Endometrial carcinoma is the most common carcinoma of the female reproductive tract in developed countries and is the third most common cause of death in carcinoma in women. In 2012, endometrial carcinoma occurred in 320,000 women and caused 76,000 deaths worldwide.¹ In developed countries, 75% of cases of endometrial carcinoma occur in patients around 60 years of age during the post-menopausal period, so the most common symptom is post-bleeding menopause. Evidence about the relationship between the Body Mass Index (BMI) is high, and the risk of endometrial cancer, including subtypes in Asian populations is still limited. In Indonesia, the latest study found the prevalence of endometrial carcinoma in Cipto Mangunkusumo Hospital (RSCM) Jakarta reached 7.2 cases per year. The age of patients tends to be younger, which is as much as 63.9% at the age of ≥ 50 years and as much as 12.5% at the age

of ≤ 40 years. The most common type based on histopathology type is endometrioid endometrial carcinoma (EEC) of around 75-80%, serous papillary carcinoma 5-10% and clear cell carcinoma 3-5%. Serous papillary carcinoma and clear cell carcinoma are aggressive types.^{2,3,4,5}

Excess Estrogen is allegedly the cause of endometrial carcinoma. Ovaries produce and release estrogen, but fat tissue also has the power to convert some hormones into estrogen. The more fat tissue, the more hormones that are converted to estrogen, increasing estrogen levels in women and at the risk of EEC.⁶

Some experts argue, there is a correlation between weight gain and EEC events. According to Arem, et al. (2013) there may be an association of obesity with the risk of EEC and women with EEC with normal weight may have better survival than obesity.^{7,8}

BMI is a measure of weight adjusted for height, calculated as weight in kilograms divided by square of height in meters (kg / m^2). Research has shown that BMI levels correlate with body fat and with future health risks. High BMI predicts future morbidity and mortality. Therefore, BMI is the right measure for obesity screening and its health risks.⁹

Some studies suggest that increasing weight and obesity can increase the risk of EEC. The risk was greatest in women who had a $\geq 35\%$ increase in normal BMI or women who averaged $\geq 1\%$ increase in normal BMI during the period from the age of 21 years. In Japanese and Americans, a 5% increase in normal BMI increases the risk of EEC.¹⁰

Differentiation of malignancy for EEC according to the World Health Organization (WHO) is made based on structural histopathology and cell atypia. These grading are grouped according to the degree of differentiation of the EEC seen from the growth patterns of non-squamous or non-morula shapes. Core grades are determined by variations in the size and shape of the nucleus, chromatin distribution, and size of nucleoli.¹¹

II. MATERIAL AND METHODS

Sample selection

This study was conducted in a cross-sectional manner in the Anatomy Pathology Department, Medan H. Adam Malik General Hospital and included 31 EEC cases, which aimed to assess

whether there was a relationship between BMI and EEC histopathological grading. All samples are obtained through surgical procedures. The inclusion criteria were EEC cases with adequate clinical data, fixed tissue blocks with undamaged formalin-fixed with adequate tumor tissue. Detailed clinical data obtained from medical records or pathology records consisting of age, and BMI status or body weight and height, can then be calculated the number of BMI of these patients. Histopathological grading was determined independently by the researchers through a slide examination of hematoxylin and eosin.

Body Mass Index (BMI)

BMI is a body mass index calculated by comparing body weight with height, calculated by dividing body weight in kilograms with height in meters squared.

$$BMI = \frac{\text{Weight Loss (Kilograms)}}{\text{Body Height (Meter)}^2}$$

BMI Category

BMI	Weight Status
< 18.5	Underweight
18.5 – 24.9	Normoweight
25.0 – 29.9	Overweight
30.0 and above	Obesity

Grading

Histopathological grading is based on the degree of structural differentiation and cell atypia.¹⁵ This grading is grouped according to the degree of differentiation of EEC seen from the following non-squamous or non-morula solid growth patterns as follows: GI (5% or less), G-II (6 -50%), G-III (> 50%). The core grade is determined by variations in core size and shape, chromatin distribution, and nucleoli size. The grade-I core is oval, slightly enlarged, and has evenly spread chromatin. The grade-III nucleus showed a striking and pleomorphic enlargement, with irregular coarse chromatin and a prominent eosinophilic nucleoli. Grade-II core images between grade-I and grade-III. Mitotic activity is an independent variable but generally increases with an increase in core grade.^{11,12,13,14,15,16}

Statistical analysis

Statistical analysis was carried out using the SPSS version 22.0 software package (SPSS Inc., Chicago) with 95% confidence intervals and Microsoft Excel 2010. Variable categories were presented in frequency and percentage. The Kruskal-Wallis test was applied to find the relationship between BMI and EEC histopathology grading. P values> 0.05 were considered insignificant.

III. RESULT

The average age for Endometrioid Endometrial Carcinoma (EEC) patients is 53.4 (± 14.1) with the youngest patients aged 21-26 as many as 1 case (3.2%) and the oldest age is the 81-86 age group year with a total sample of 1 case (3.2%), and the age of most patients was in the age group 51-56 years with a total

sample of 9 cases (29.0%). Characteristics based on EEC patient age are summarized in table 1.

Table 1. Characteristics of EEC patients based on age

BMI	Number of cases	Percentage (%)
Age, mean ± SD, years	53,4 ± 14,1	
21 – 26	1	3,2
27 - 32	2	6,5
33 – 38	1	3,2
39 – 44	2	6,5
45 – 50	6	19,3
51 – 56	9	29,0
57 – 62	2	6,5
63 – 68	2	6,5
69 – 74	4	12,9
75 – 80	1	3,2
81 - 86	1	3,2
total	31	100

Frequency distribution of EEC patients based on histopathological grading obtained data on frequency of EEC patients with histopathological grading of Grade I were 14 people (45.2%), Grade II was 8 people (25.8%), and Grade III was 9 people (29.0%) shown in table 2.

Table 2. Grading of EEC patients histopathology.

Grading	Total (n)	Percentage (%)
Grade I	14	45,2
Grade II	8	25,8
Grade III	9	29,0
total	31	100

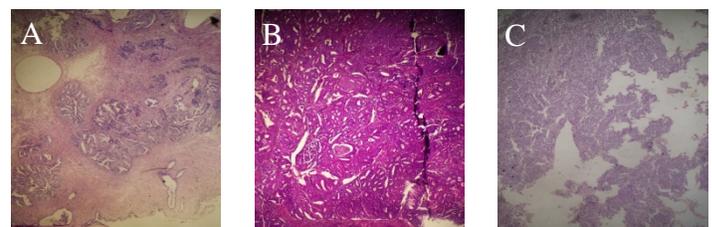

Figure 1. EEC A. Gr I, B. Gr II, C. Gr III

Characteristics of EEC patients based on the BMI category in EEC patients obtained data namely underweight with the number of 2 people (6.5%), normoweight as many as 15 people (48.4%), overweight as many as 8 people (25.8%), and obesity as many as 6 people (19.3%) listed in table 3.

Table 3. BMI category in EEC patients

BMI	Total (n)	Percentage (%)
Underweight	2	6,5
Normoweight	15	48,4
Overweight	8	25,8
Obesity	6	19,3
total	31	100

Based on the WHO classification, EEC consists of grade I, grade II and grade III. And BMI consists of 4 categories of underweight, normoweight, overweight and obesity. The frequency distribution of all EEC patients based on BMI and histopathological grading can be seen in table 4.

Table 4. BMI Distribution Based on Patients Grading

No	BMI	Grading						P-value*
		Grade 1		Grade 2		Grade 3		
		n	%	n	%	n	%	
1.	Underweight	1	50,0	1	50,0	0	0	0,563
2.	Normoweight	5	33,3	4	26,7	6	40,0	
3.	Overweight	4	50,0	2	25,0	2	25,0	
4.	Obesity	4	66,6	1	16,7	1	16,7	

*p>0,005

Based on table 4, it is stated that patients with underweight category have 1 case (50.0%) in grade 1 histopathological grading and 1 case (50.0%) in grade 2 and not even 1 case (0%) in grade 3. Furthermore in the normoweight category, there were 5 cases (33.3%) in grade 1 and 4 cases of histopathology grading (26.7%) in grade 2 and found 6 cases (40.0%) grade 3. While in the overweight category, there were 4 cases (50.0%) in grade 1 and 2 cases of histopathology grading (25.0%) in grade 2 and found 2 cases (25.0%) grade 3. And in the obesity category, there were 4 cases (66.6%) in grade 1 histopathology grading, 1 case (16.7%) in grade 2 and 1 case (16.7%) in grade 3. But the results of the analysis of the relationship between BMI and histopathological grading of EEC patients in this study obtained p-value = 0.563 (p> 0.05) which showed no significant relationship.

IV. DISCUSSION

EEC is a malignant primary epithelial tumor in the endometrium, a glandular neoplasm that shows acinar, papillary or partially dense configurations and potentially regarding myometrium.¹⁷ Most cases of EEC are often associated with endometrial exposure to estrogen stimulation. In this study it was found from 31 samples of EEC patients that many occurred in the age range of 51 - 56 years (29.0%). This situation is in accordance with Sofian A (2010) study where the age of EEC patients at the age of ≥50 years.³ While in the Nevadunsky NS (2014) study, the results of the study showed that the average age of patients with EEC was 67.1 years with a standard deviation of ± 11.9 years.¹⁸

From this study also found that the highest rate of EEC patients was grade I as many as 14 people (45.2%). This is in accordance with the study of Nevadunsky NS (2014) which also stated that the highest number of EEC patients was grade I as many as 380 people (64.3%)¹⁸. While in the study of O.G. Trifanescu found the highest number of EEC patients in grade III histopathology.¹⁹

Characteristics of EEC patients based on the BMI category in EEC patients from this study, found the normoweight category as the highest number with 15 people (48.4%). While in the study

of Nevadunsky NS (2014) the highest number was in the category of obesity (66.3%).¹⁷

Some experts argue, there is a relationship of weight gain with the EEC event where excess estrogen is allegedly the cause. This excess produced estrogen will be stored cumulatively, considered to increase the risk of EEC.²¹ Various factors known to affect EEC development include (1) obesity, (2) diabetes, (3) hypertension, (4) infertility, and (5) exposure against unopposed estrogen (estrogen used in replacement / estrogen therapy without progestin administration to prevent side effects). Prolonged estrogen replacement therapy and ovarian tumors that secrete estrogen increase the risk of endometrioid endometrial carcinoma.

The relationship between BMI and histopathological grading of EEC patients in this study found that the category of obesity with grade I histopathology grading was the highest incidence (66.6%). This is in accordance with the results of the Nevadunsky NS (2014) study which also obtained the category of obesity with grade I histology grading as the highest incidence (60.9%) 30. But the results of the analysis of the relationship between BMI and histopathological grading of EEC patients in this study obtained p-value = 0.563 (p> 0.05) which showed no significant relationship. This may be the data of BMI or body weight and height of the patients who came to RSUP HAM Medan, assessed at the same time. While the possibility of patients suffering from EEC has occurred long before the patient came to RSUP HAM Medan.

But from this study there is an interesting one although statistically the relationship between BMI and EEC histopathology grading is not significant. The consistency of the characteristics of overweight and obesity seems consistent in grade 1 with the highest incidence and decreasing with increasing histopathological grading of EEC. There is a tendency of overweight and obesity most often found in grade 1. While in grade 2 and grade 3 the incidence rate decreases. This may occur because of the patient's health condition which is decreasing due to the disease, or perhaps due to the patient's psychological state of the illness. Side effects of therapy also cannot be excluded as a cause of a decrease in the patient's BMI category along with the course of the disease.

V. CONCLUSION

There is no significant relationship between BMI and EEC histopathology grading.

Abstract

The CNC Lathe machines are constructed base on conventional lathe machine. This paper is the conventional lathe can be modified to CNC lathe machine. For 2.5 m length conventional lathe machine to be CNC lathe machine, reassembling is done. With the dislodge parts of conventional lathe, some changes, substitutions and necessary parts construction is done to be CNC. For converting to CNC, some necessary parts for changes and substitutions fagor materials are used. Gear box design of the spindle unit in CNC lathe machine and design calculation of Gears and Shafts in Head Stock are expressed. This study is including Gear Train, Gear Design, Strength Check, Dynamic Check and Shaft design material.

Keyword; Gear Train, Gear Design, Strength Check, Dynamic Check, Shaft design

I. INTRODUCTION

A lathe is machine tool for producing cylindrical, conical and flat surfaces. It can be used for drilling and boring holes which may be cylindrical or conical shape.

In its operation the lathe holds a piece of material between two rigid supports called centers, or by some other device such as a chuck or face plate, screwed or secured to the nose or end of the spindle.

The tool post is supported on a cross-slide which moves perpendicular to the spindle axis whilst the cross-slide is integral with a carriage which slides along the bed of the lathe. The spindle axis is parallel with the slideways of the bed, so that movement of the carriage along the bed causes the tool to move parallel with the spindle axis.

The CNC system are constructed with an NC unit integrated with a programmable logic controller (PLC) and sometimes with an additional external PLC (non-integrated). The NC controls the spindle movement and the speeds and feeds in machining. It calculates the traversing paths of the axes as defined by inputs. The PLC controls the peripheral actuating elements of the machine such as solenoids, relay coils, etc. Working together, the NC and PLC enable the machine tool to operate automatically. Positioning and part accuracy depend on the CNC system's computer control algorithms, the system resolution and the basic mechanical machine inaccuracies.

By utilizing computers as an integral of the control system, modern manufacturing technique and industrial production become advanced and developed. Computer Numerical Control (CNC) is one of the major development in Computer Aided Design/Computer Aided Manufacturing (CAD/CAM) technology. It is the process of manufacturing machine parts in a production environment to control and allocate by a computerized controller. Due to the digital technology used in such controller, the design of automation systems have more flexibility which is the keyword to characterize the manufacturing system. With the programs of computer technology and programming technique, CNC machines enable to automate the machining process with flexibility. This means capacity in a short time. As a consequence, CNC machines are economical for mass, batch and in many cases single-item production. It can provide the higher productivity rate, better quality, accuracy of manufactured parts and stabilization to produce complex or otherwise impossible jobs.

The main purpose of this study is to design a CNC lathe machine modified from a conventional lathe.

The carriage movements are made by hand wheel via a lead screw (ACME thread) in conventional lathe. Whereas these movements are driven by stepper motor in CNC lathe machine. These motor can be controlled for exact revolutions. And the ball screw is more efficient than ACME thread. The surface finish of CNC lathe is more precise than that of the conventional lathe and power losses is significantly decreased.

The gearing system and pulleys are required in conventional lathe to speed up and down the spindle of lathe. But in CNC lathe machine speed up and down can be adjusted by the voltage control of the spindle motor. So efficiency the process of increases because power transmission losses decreases.

The following figure (1) is Gear Trains in Head Stock at Conventional lathe machine. Gears arrangement and shafts rotation are shown in figure

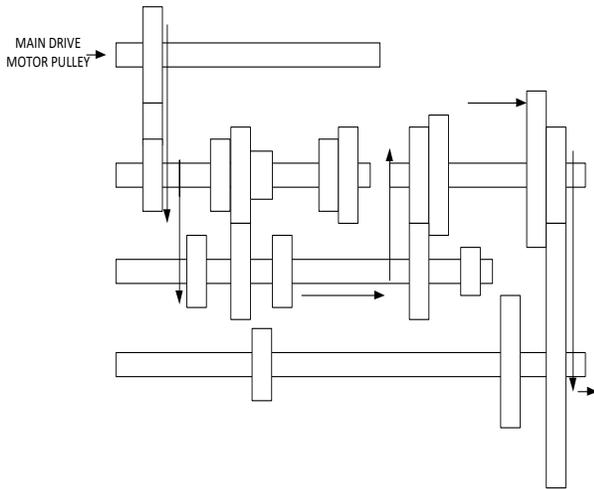

Figure (1) Gear Trains in Head Stock at Conventional Lathe

To get the desired three speed ranges gear trains in conventional lathe machine was changed, figure (2) is gear trains in Head Stock at CNC lathe machine.

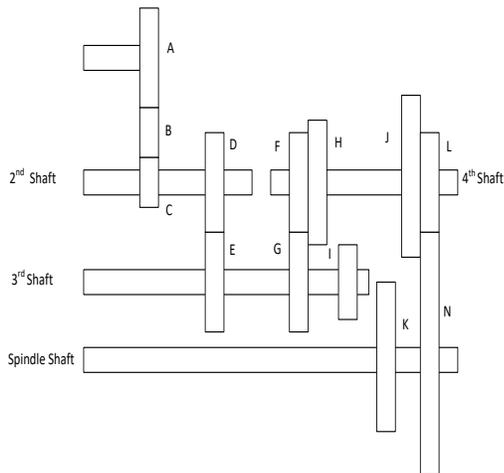

Figure (2) Gear Trains in Head Stock at CNC Lathe Machine

The desired three speed ranges are 0-100 RPM at low speed position, 0-500 RPM at middle speed position and 0-1500 RPM at high speed position

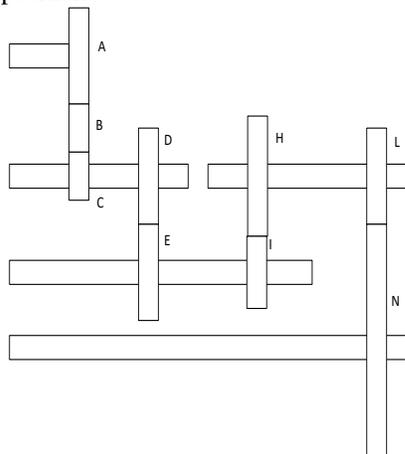

Figure (3) Gear Arrangement at 0-100 RPM

II. DESIGN CALCULATION OF GEAR TRAINS

Calculation of Input Shaft Speed
 For Gear Arrangement at 0-100 rpm
 Output speed of Spindle = 100 rpm

$$\text{Train Value, TV} = \frac{\text{Input speed}}{\text{Output speed}}$$

$$\begin{aligned} \text{TV} &= - \frac{N_B}{N_A} \times \frac{N_C}{N_B} \times \frac{N_E}{N_D} \times \frac{N_H}{N_I} \times \frac{N_N}{N_L} \\ &= - \frac{36}{50} \times \frac{36}{36} \times \frac{42}{42} \times \frac{68}{17} \times \frac{72}{18} \\ &= - 11.52 \\ &= 11.52 \text{ (opposite direction)} \end{aligned}$$

$$\begin{aligned} \text{Input Speed} &= \text{TV} \times \text{Output Speed} \\ &= 11.52 \times 100 \\ &= 1152 \text{ rpm} \end{aligned}$$

$$(\text{rpm})_A = (\text{rpm})_P = 1152 \text{ rpm}$$

$$\frac{(\text{rpm})_{\text{motor}}}{(\text{rpm})_{\text{pulley}}} = \frac{D_P}{D_m} \times \frac{(100 - s)}{100}$$

Slip (0-5 %)
 Maximum slip, $s = 5\%$

$$\begin{aligned} (\text{rpm})_{\text{motor}} &= 1152 \times 2 \times \frac{100 - 5}{100} \\ &= 2188.8 \text{ rpm} \\ &= 2189 \text{ rpm} \end{aligned}$$

The theoretical desired meter speed = 22189 rpm

Design Calculation of Spur Gear
 Pinion (B) on Idler Shaft and Gear (A) on 1st Shaft
 Input power = 10 kW (motor)
 Material = Cast Steel

$$\begin{aligned} S_o &= 140 \text{ MN/m}^2 \\ \text{BHN} &= 400 \\ E_p &= 200 \times 10^9 \text{ N/m}^2 \\ E_g &= 200 \times 10^9 \text{ N/m}^2 \\ C &= \text{precision cut} \\ (\text{rpm})_p &= 1600 \text{ rpm} \end{aligned}$$

$$\begin{aligned} \text{VR} &= 1.388 \\ N_p &= 36 \\ D_p &= 108 \text{ mm} \\ N_g &= 50 \\ D_g &= \frac{50}{36} \times 108 = 150 \text{ mm} \\ \frac{(\text{rpm})_p}{(\text{rpm})_g} &= \frac{1600}{(\text{rpm})_g} = \frac{50}{36} \\ (\text{rpm})_g &= 1152 \text{ rpm} \end{aligned}$$

Gear and pinion are same material.

Base design on pinion.

Strength Check

Known diameter case

$$\left[\frac{1}{m^2 y} \right]_{all} = \frac{S_{all} k \pi^2}{F_t}$$

$$V = \frac{\pi \times D_p \times (rpm)_p}{60} = \frac{\pi \times 0.108 \times 1600}{60}$$

$$= 9.048 \text{ m/s} < 10 \text{ m/s}$$

$$S_{all} = S_o \left[\frac{3}{3+V} \right]$$

$$= 140 \left[\frac{3}{3+9.048} \right] = 34.861 \text{ MN/m}^2$$

$$F_t = \frac{9550 \times kW}{(rpm)_p \times D_{p/2}} = \frac{9550 \times 10}{1600 \times \frac{0.108}{2}} = 1105.324 \text{ N}$$

Let $k_{(max)} = 4$

$$\left[\frac{1}{m^2 y} \right]_{all} = \frac{34.861 \times 4 \times \pi^2}{1105.324} = 1.245 \text{ MN/m}^2$$

Assume, $y = 0.1$

$$\left[\frac{1}{m^2 \times 0.1} \right] = 1.245 \times 10^6$$

$$m = 2.834 \text{ mm}$$

Standard module series, 1, 1.25, 1.5, 2, 2.5, 3, 4, 5, ...

Try, $m = 2.5$

$$N_p = \frac{108}{2.5} = 43.2 \neq \text{integer}$$

Try, $m = 3$

$$N_p = \frac{108}{3} = 36$$

$N_p = 36, y_p = 0.12$ (From form factor Table)

$$\left[\frac{1}{m^2 y} \right]_{indu} = \frac{1}{(0.003)^2 \times 0.12} = 0.926 \text{ MN/m}^2$$

$$\left[\frac{1}{m^2 y} \right]_{all} > \left[\frac{1}{m^2 y} \right]_{indu}$$

$$k_{redu} = k_{(max)} \times \frac{\left[\frac{1}{m^2 y} \right]_{indu}}{\left[\frac{1}{m^2 y} \right]_{all}}$$

Design Satisfactory
Choose, $m = 3$

$$= 4 \times \frac{0.926}{1.254} = 2.975$$

$$\text{face width, } b = k_{redu} \times \pi \times m$$

$$= 2.975 \times \pi \times 3$$

$$= 28 \text{ mm}$$

Dynamic Check

Endurance Force

$$F_o = S_o \text{ by } \pi m$$

$$= 140 \times 10^6 \times 0.028 \times 0.12 \times \pi \times 0.003$$

$$= 4433 \text{ N}$$

$m = 3$, Tooth Error = 0.01

$C = 114$ (from Table 4.2)

Dynamic Force

$$F_d = F_t + \frac{21V(bC + F_t)}{21V + \sqrt{bC + F_t}}$$

$$= 1105.324 + \frac{21 \times 9.048(0.028 \times 114 + 1105.324)}{21 \times 9.048 + \sqrt{0.028 \times 114 + 1105.324}}$$

$$= 2048.560 \text{ N}$$

Wear Force,

$F_w = D_p b K Q$

$$Q = \frac{2N_g}{N_g + N_p} = \frac{2 \times 50}{50 + 36} = 1.163$$

$$S_{es} = [2.75(\text{BHN}) - 70] \text{ MN/m}^2$$

$$= [2.75(400) - 70] = 1030 \text{ MN/m}^2$$

$$K = \frac{S_{es}^2 \sin \phi \left[\frac{1}{E_p} + \frac{1}{E_g} \right]}{1.4}$$

$$= \frac{(1030 \times 10^6)^2 \sin 20^\circ \left[\frac{2}{200 \times 10^9} \right]}{1.4}$$

$$= 2591.779 \text{ kN/m}^2$$

$$F_w = 0.108 \times 0.028 \times 2591.779 \times 10^3 \times 1.163$$

$$= 9115.059 \text{ N}$$

$F_o > F_d, F_w > F_d$

\therefore Design is Satisfactory.

III. DESIGN CALCULATION OF SHAFTS FOR GEAR ARRANGEMENT AT 0-100 RPM

2nd Shaft

$D_c = 108 \text{ mm}, D_D = 126 \text{ mm}$

$(rpm)_c = 1600 \text{ rpm}$

Power = 10 kW

$$M_t = \frac{9550 \times kW}{rpm} = \frac{9550 \times 10}{1600} = 59.688 \text{ Nm}$$

$$F_{t1} = 1105.33 \text{ N}, F_{r1} = F_{t1} \tan 20^\circ = 402.307 \text{ N}$$

$$F_{t2} = 947.429 \text{ N}, F_{r2} = F_{t2} \tan 20^\circ = 344.836 \text{ N}$$

From HLD

Taking moment about R_1 ,

$$\sum M_{R_1} = 0 [\downarrow +]$$

$$-R_2 \times 0.3335 + 947.429 \times 0.139 + 1105.33 \times 0.05 = 0$$

$$R_2 = 560.597 \text{ N}$$

$$[\sum F_y \uparrow = 0]$$

$$R_1 + R_2 - 947.429 - 1105.33 = 0$$

$$R_1 = 1492.162 \text{ N}$$

From H.B.M.D

$$M_1 = 1492.162 \times 0.05 = 74.608 \text{ Nm}$$

$$M_2 = 560.597 \times 0.1945 = 109.036 \text{ Nm}$$

From VLD

Taking moment about R_3

$$\sum M_{R_3} = 0 [\leftarrow +]$$

$$R_4 \times 0.3335 - 344.836 \times 0.139 + 402.307 \times 0.05 = 0$$

$$R_3 = 140.88 \text{ N}$$

From V.B.M.D

$$M_3 = 140.88 \times 0.05 = 7.044 \text{ Nm}$$

$$M_4 = 83.409 \times 0.1945 = 16.223 \text{ Nm}$$

$$M_{R_1} = \sqrt{M_1^2 + M_3^2} = 74.939 \text{ Nm}$$

$$M_{R_2} = \sqrt{M_2^2 + M_4^2} = 110.236 \text{ Nm}$$

$$k_b = 1.5, k_t = 1$$

$$\text{Max : } M_b = 110.236 \text{ Nm}$$

$$S_s = 40 \text{ MN/m}^2$$

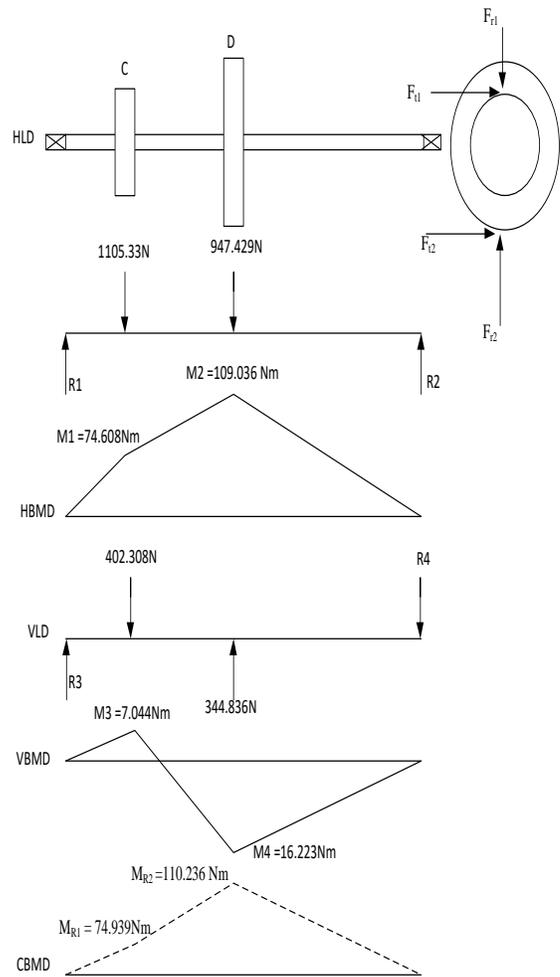

$$d^3 = \frac{16}{\pi S_s} \sqrt{(k_b M_b)^2 + (k_t M_t)^2}$$

$$= \frac{16}{\pi \times 40 \times 10^6} \sqrt{(1.5 \times 110.236)^2 + (1 \times 59.688)^2}$$

$$d^3 = 0.02818 \text{ m}$$

$$= 28.18 \text{ mm}$$

$$\text{Std, } d = 29 \text{ mm}$$

IV.CONCLUSION

The main aim of this paper is to help in reassembling from conventional lathe machine to CNC lathe Machine. The modified CNC Lathe was fabricated by using 2.5 meter local conventional lathe machine. The modified machine is made of parts, such as ballscrew, servomotor and computer. In this paper, my portion is Design Calculation of Gear that is arranged to transfer the ranges of spindle. There were 18 ranges in the lathe deal with. But in CNC Lathe, there are only three wide ranges. The three speed ranges in CNC are low speed position 0-100 rpm and, middle speed position 0-500 rpm and high speed position 0-1500 rpm. In figure (1), it is the gear arrangement of Head Stock in Conventional Lathe Machine and in figure (2), it is transferring for Gear Arrangement of CNC Lathe Machine. In this paper, the calculation on appropriate diameter of Shafts and Gears design has been made.

The required design calculation of Spur Gears can be calculated through both Strength and Dynamic check and it involves many steps. In design calculation of shaft, it requires rotational speed of shaft must be known. The ASME Code Equation is used to calculate the design of shafts. In this paper, design calculation results for gear and shaft are satisfied machine design. The results of gears and shafts are described with tables.

ACKNOWLEDGMENT

We would like to sincerely acknowledge the encourageous efforts of our department of mechanical engineering, Technological University (Mawlamyine). I wish to express my sincere thanks to all my friends for their goodwill and constructive ideas.

Abstract- Plants have evolved on the earth' surface together with human beings, and then they depend on each other like a friend. Plants produce many different types of sunscreens. Some of these are physical sunscreens (trichomes) to reflect UV-B and some are chemical sunscreens (anthocyanins) to absorb UV-B. The high level UV radiation can increase trichome density and anthocyanin content. On the other hand, plants' leaves in the high level UV radiation have high concentration of absorbing pigments. In this work, the absorbance spectra and the light harvesting efficiency (LHE%) of absorbing pigments extracted from the leaves of pink-flowered rain tree (*Samanea saman*) at sea level and at 1200 m above sea level, have been studied by UV-VIS spectroscopy to protect the effects of UV attack. According to the absorbance spectra, two plants can absorb nearly 100% of UV-A and UV-B, and the absorbing species in higher elevation plants are more concentrated than that in lower elevation plants.

Index Terms- absorbance, LHE%, sinapoyl malate, sunscreen, UVR8

1. INTRODUCTION

Plants need to protect themselves from damaging ultraviolet rays because they bask in the sun for several hours in a day. While they absorb light for photosynthesis, many plants use a group of chemicals called sinapate esters to defend against the sun. These aromatic compounds sit in the upper cell layers of the plants' leaves. One type of these compounds is sinapoyl malate which provides the bulk of the UV protection. On the other hand, they filter out the entire spectrum of ultraviolet-B radiation, known to damage plants and human DNA. The range of UV wavelengths blocked by sinapoyl malate is the same as those that

damage human tissues. And then there is the relation between leaf thickness and UV-B absorbing pigments of plants with an elevation gradient. Terrestrial plant species vary widely in their adaptation to solar UV-B radiation. The various responses of plants in higher position to enhanced UV-B protection are increasing leaf thickness and increasing concentrations of UV-B absorbing compounds^[4].

Electromagnetic radiation is broadly divided into infrared radiation (IR), visible light (VIS), and ultraviolet radiation (UV). Heat is part of IR radiation, which is not visible to the human eye. VIS is the wavelength range of general illumination. UV radiation is also divided into three distinct bands in order of decreasing wavelength and increasing energy: UV-A (315~400 nm), UV-B (280~315 nm), and UV-C (100~280 nm). Different wavelengths and energies associated with UV subdivision correspond to distinctly different effects on living tissue. The wavelengths and the photon energies of UV-A, UV-B and UV-C are listed in Table 1.1.

Table 1.1 Wavelength and Energy of UV spectra

Spectrum	Wavelength(nm)	Energy(eV)
UV-A	400~315	3~3.9
UV-B	315~280	3.9~4.4
UV-C	280~100	4.4~12.3

The amount of solar UV-A and UV-B reaching the earth's surface is affected by latitude, altitude, season, time of the day, cloudiness, and ozone layer. The highest irradiance is at the higher elevations and the equator. UV radiation is strongest between 10 am and 4 pm. During a sunny day, the UV spectrum

that reaches the earth's surface consists of 3.5% UV-B and 96.5% of UV-A. UVB is primarily associated with erythema and sunburn. It can cause immunosuppression and photocarcinogenesis^[3].

The unfiltered UV radiations have been prevented by ozone layer (O₃) for living things and non-living things. The thickness of ozone layer (about 3 mm at STP) varies seasonally and geographically. Every 0.01 mm thickness of the layer is equal to one Dobson Unit (1 DU). The average amount of ozone in the stratosphere layer across the globe is about 300 DU or thickness of only 3 mm at STP. Ozone layer cannot absolutely absorb UV-A, but it can absorb all of UV-C and most of UV-B. So, most UV-A and less UV-B can reach on the earth's surface, shown in Fig 1.1. The decrease of thickness of ozone layer or its depletion can cause the problems for human beings and living things due to the falling of the intense unfiltered UV radiation. UV-B can cause the burn of the skin, the skin cancer and the damage of cornea. The ozone layer is now still being damaged by the CFC emission. CFC is man-made chemical that contains chlorine, fluorine and carbon. When the chlorine and bromine react with ozone layer, the fission of O₃ causes ozone layer depletion. The substances that decrease the thickness of ozone layer are called Ozone Depleting Substances (ODS): Chlorofluoro carbon (CFC). So, everybody should avoid outdoor exposure from 10 am to 4 pm. World Health Organization and World Meteorological Organization provide the UV Index, shown in Table 1.2, for every day to the public. UV Index reading of 0 to 2 means low danger from the sun's UV rays for the average person. Index of 3 to 5 causes moderate risk of harm from unprotected sun exposure and 6 to 7 of UV Index is high risk of harm. At this time, protection against skin and eye damage is needed. UV Index of 8 to 10 means very high risk of harm. People need to take extra precautions because unprotected skin and eyes will be damaged and can burn quickly. 11 or more means extreme risk of harm from unprotected sun exposure. All precautions must be done because unprotected skin and eyes can burn within a few minutes^[6].

According to the literature, plants' leaves can prevent the UV attack although the ozone layer is still damaged by CFC emission. Plants sense UV light through specific UV photo-receptors called UV Resistance Locus 8 (UVR8). It is important for a plant to be able to sense UV wavelengths because they can cause damage to DNA. Upon sensing UV light, UVR8 photo-receptors send signals to other parts of the plant that causes changes in growth and development. The plant will begin to make DNA repair enzymes for fixing damaged DNA and "sunscreen" for preventing more damage. Together, these protective mechanisms prevent further damage to plant cells.

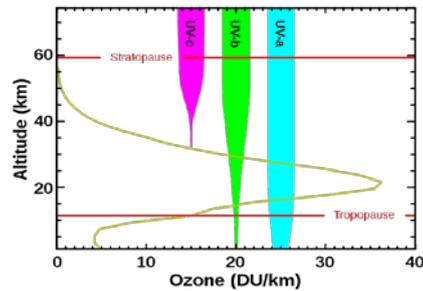

Fig 1.1 UV protection of ozone layer

There are many UV photo-receptors in the plants' leaves such as UVR8 for UV-B and cryptochrome for UV-A. The absorption of these rays by UVR8 induces physiological responses that enable the plant to acclimatize and survive. Indeed, plants produce enzymes that repair damage caused to DNA during sun exposure, as well as powerful antioxidants that neutralize free radicals produced by the action of UV. UVR8 receptors accumulate within the cell nucleus and participate in a cascade of biochemical reactions. UVR8 receptors are ultrafast photoprotecting sunscreens in natural plants. The response of UVR8 with UV-B by trans-cis photoisomerization is shown in Fig 1.2^[5].

Table 1.2 UV Index

UV INDEX	DANGER CATEGORY
11+	Extreme
8 to 10	Very High
6 to 7	High
3 to 5	Moderate
1 to 2	Low

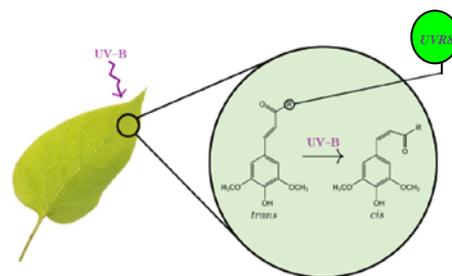

Fig 1.2 Response of UVR8 in plants'

In this work, the comparative study of optical properties of light absorbing pigments extracted from pink-flowered rain tree leaves at sea level and at 1200 m above sea level in Rakhine state, Myanmar, have been analyzed spectrophotometrically for the protection of UV attack. Fig 1.3 shows the electromagnetic spectrum of solar radiation with UV-A and UV-B^[7].

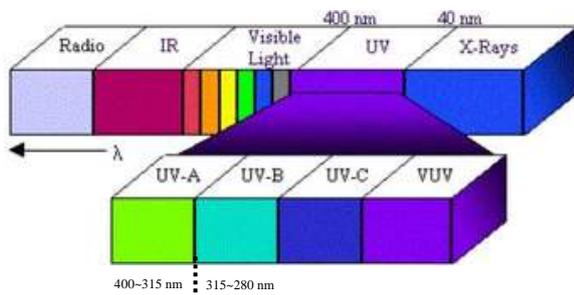

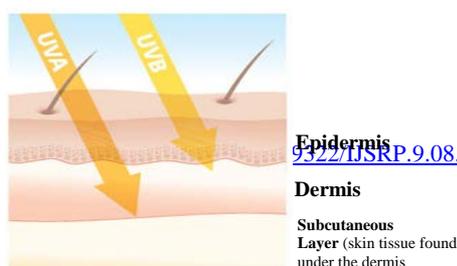

Fig 1.3 Electromagnetic spectrum

II. BACKGROUND THEORY

2.1. Classification of the Effects of Ultraviolet (UV) Radiation and UV-VIS spectroscopy

Ultraviolet (UV) radiation are classified into three groups according to their wavelength. They differ in their biological activity and the extent to which they can penetrate the skin. The shorter the wavelength, the more harmful the UV radiation. However, the shorter wavelength of UV radiation is less able to penetrate the skin. UV-C with the shortest wavelength is the most damaging type of UV radiation. But it is completely filtered by ozone layer and does not reach the earth's surface. UV-B is very biologically active but cannot penetrate beyond the superficial skin layers, shown in Fig 2.1. It is responsible for delayed tanning and burning. In addition to these short-term effects, it enhances skin ageing and significantly promotes the development of skin cancer. But most of UV-B are filtered by ozone layer.

As shown in Fig 2.1, UV-A can penetrate into the deeper layers of the skin and is responsible for the immediate tanning effect. Furthermore, it also contributes to skin ageing and wrinkling. For a long time it was thought that UV-A could not cause any lasting damage. Recent studies strongly suggest that it may also enhance the development of skin cancers^[1].

To protect UV attack, the materials used in UV protection have to be analyzed for the optical properties of these materials. The absorbance of a material is directly proportional to the path length of material and the concentration of the absorbing species in material. So, UV-VIS spectroscopy is also called the absorption spectroscopy in UV-VIS spectral region.

$$A = \epsilon c L = \log_{10} \frac{I_0}{I}$$

A = absorbance

ϵ = molar absorptivity or extinction coefficient

c = concentration of the absorbing species

L = path-length

I_0 = intensity of light before passing through the sample

I = intensity of light after passing through the sample

This is Beer-Lambert law for absorption spectroscopy. The light harvesting efficiency (LHE%) of absorbing pigments can be calculated by the below formula.

$$\%LHE = (1 - 10^{-A}) \times 100\%$$

LHE = light harvesting efficiency

A = absorbance

The materials with high energy UV photons absorption and broader absorption band should be selected as UV protectors. And then they need to have non-toxicity, good adhesion and stability to use in sunscreen.

III. EXPERIMENTAL SET-UP

3.1. Preparation and Characterization of Light Absorbing Pigments

The pink-flowered rain tree leaves, shown in Fig 3.1, were dried in air at first and cut into small pieces. And then they were pounded with motor and pestle. After that, the powder was mixed with ethanol for 24 h, in Fig 3.2(a). Before the UV measurement, the solution was made by using VOTEX-MIXER for more pigments extraction, in Fig 3.2(b) and was created to filter by TABLE TOP CENTRIFUGE, in Fig 3.2(c)^[2].

Fig 3.1 Leaves of pink-flowered rain tree

Fig 3.2 shows the pigment extracting process and the photograph of UV-1800 spectrophotometer, in Fig 3.2(d).

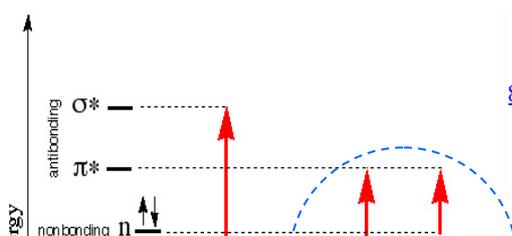

Fig 3.2 Preparation and characterization of UV-VIS spectrophotometry

3.2. Analysis of UV-VIS Spectroscopy

UV-1800 spectrophotometer is a double-beam instrument in which the light is split into two beams before it reaches the sample. One beam is used as the reference while other beam passes through the sample. The reference beam intensity is taken as 100% Transmittance (or 0 Absorbance), and the measurement is displayed in the ratio of the two beam intensities.

UV-VIS radiation interacts with the sample which causes electronic transitions (promotion of electrons from the ground state to the high energy excited state). The following electronic transitions are possible, shown in Fig 3.3: (i) $\pi \rightarrow \pi^*$, (ii) $n \rightarrow \pi^*$, (iii) $\sigma \rightarrow \sigma^*$, (iv) $n \rightarrow \sigma^*$. Among them, σ to σ^* transition requires an absorption of a photon with a wavelength less than 200 nm and n to σ^* is initiated by light whose wavelength is in the range 150 ~ 250 nm. The two are not in the UV-VIS range. Thus, only π to π^* and n to π^* transitions in the region of the spectrum (200 ~ 700 nm) are observed. Many inorganic species show charge-transfer absorption.

IV. RESULTS AND DISCUSSION

4.1 Absorbance and Light Harvesting Efficiency of Pigments Extracted from Rain Tree Leaves

For the protection against UV attack, the high energy UV photon absorption is important. The broader absorption gives the high performance for UV protection. In this work, absorbance data are grouped into three regions such as UV region, visible region and IR region for the UV protection and the production of sunscreen. And then light harvesting efficiencies of pigments extracted from rain tree leaves at sea level and at 1200 m above sea level have also studied by UV-VIS spectroscopy. Absorbance spectra and light harvesting efficiency of pigments are shown in Fig 4.1 and Fig 4.2 respectively.

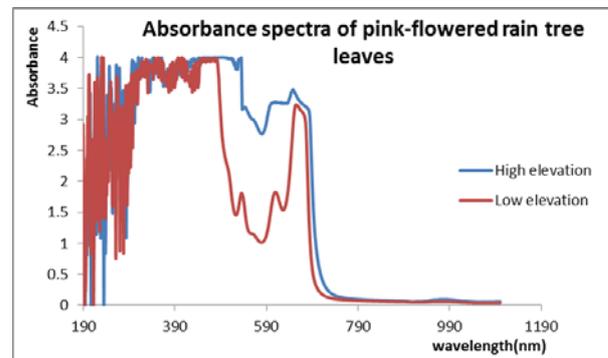

Fig 4.1 Absorbance spectra of two pigments

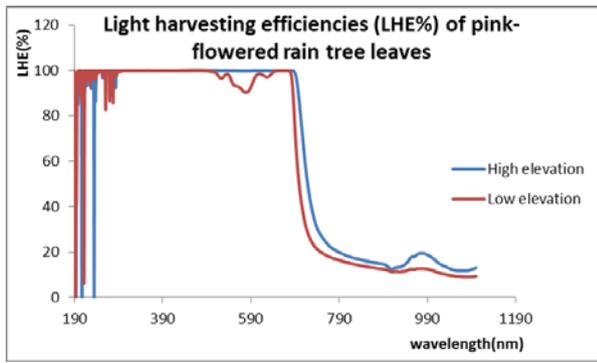

Fig 4.2 Light harvesting efficiencies of two pigments

The absorbance spectra and the light harvesting efficiencies of two pigments extracted from rain tree leaves at different elevations show that they can absolutely absorb UV-A and UV-B. Fig 4.3 and Fig 4.4 show UV-A & B absorbance and their LHEs. As shown in these figures, high elevation plant has more absorbing species than low elevation plant. Because there is more pigment concentration in high plant. But the sample preparation of two pigments should be carefully made for equal solvent and equal leaves' powder.

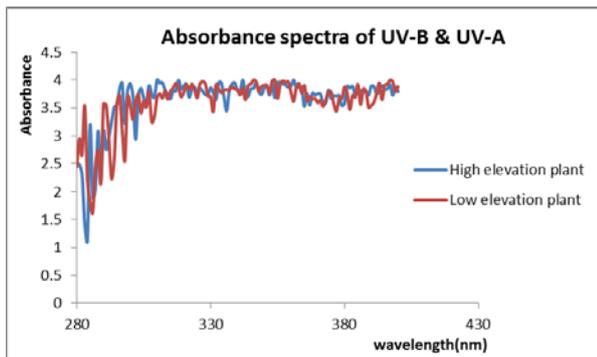

Fig 4.3 Absorbance spectra of UV-B & UV-A

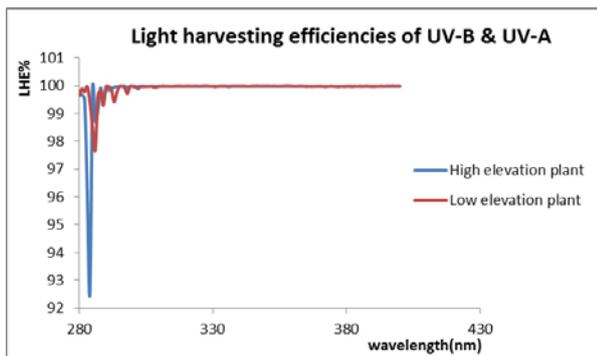

Fig 4.4 Light harvesting efficiencies of UV-B & UV-

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9260>

According to light harvesting efficiency of UV-A & B regions, the leaves of pink-flowered rain tree have more than 90% between the wavelength of 280 nm and 315 nm, and 99% of LHE between the wavelength of 315 nm and 400 nm. So pink-flowered rain tree leaves can protect UV-A and UV-B attack.

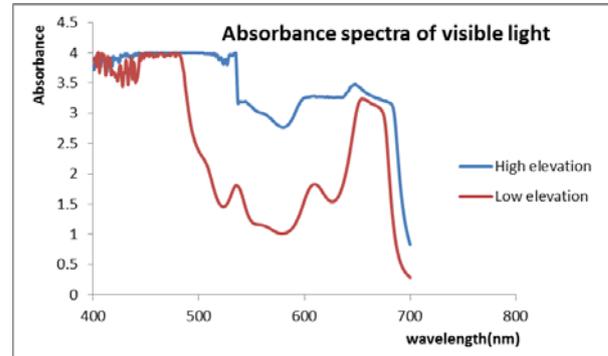

Fig 4.5 Absorbance spectra of visible light

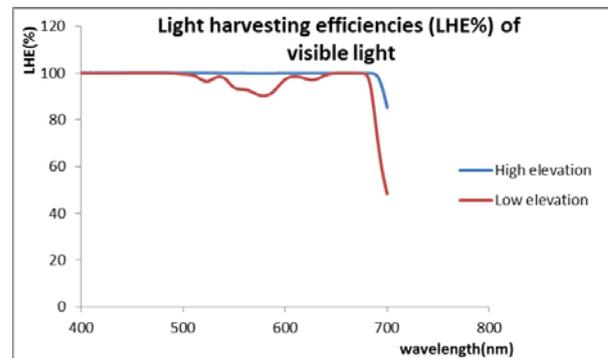

Fig 4.6 Light harvesting efficiencies of visible light

The pigment extracted from high elevation rain tree leaves has more absorbance than low elevation tree, shown in Fig 4.5. And then 100% LHE of high plant exists in the visible region.

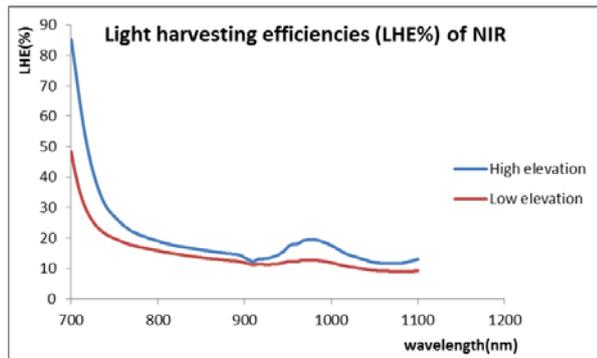

Fig 4.8 Light harvesting efficiencies of NIR

Pink-flowered rain tree has the broader absorption band up-to the wavelength of 1100 nm. On the other hand, the leaves can absorb both UV-VIS photons and NIR photons. The band-gap energy is 1.7 eV because the strong cut-off point is at the wavelength of 735 nm.

V. CONCLUSION

Ozone layer is the essential part of the earth's atmosphere to prevent the danger of unfiltered UV radiation for living things and non-living things. Due to the activities of human beings, the depletion of ozone layer has been caused by the large amount of chlorofluorocarbon (CFC) emission in the earth's atmosphere. So the uses of ODS must be reduced all over the world. To avoid the outdoor exposure of UV radiation, World Health Organization and World Meteorological Organization announce UV-Index and many cosmetic companies produce the products of UV protection.

In this work, the absorbance properties and the light harvesting efficiencies of pink-flowered rain tree leaves at sea level and at 1200 m above sea level, have been studied by UV-VIS spectroscopy for UV protection and for the use in sunscreen cosmetic products. Both of plants can absolutely absorb UV-A and UV-B. Furthermore, high elevation plant has high concentration. On the other hand, pigments in high elevation plant can more absorb UV-VIS photons than that of low one. According to Fig 4.4, both the plants have nearly 100% light harvesting efficiency of UV-A and UV-B. And then the plants' leaves in the more higher elevation, greater than 1200 m above sea level, should be analyzed for the concentration of absorbing species which give the sensitizers of DSSCs. Therefore, the shaded areas under the pink-flowered rain tree are regarded as a nice place to stay, especially in summer.

Abstract— Convolutional neural networks (CNNs), consist of multiple processing layers to learn the representations of data with multiple abstract levels. They are the most successful machine learning models in recent years. Within this paper, we will know the usage of a trained deep convolutional neural network model to extract the features of the images, and then classify the images. We will study image processing and understand image classification. It has good application prospects.

Keywords— Convolutional Neural Networks, Deep Learning, Image Pre-processing, Image Classification, Overfitting.

I. INTRODUCTION

The rise of big data and the rapid popularization of high-performance computing devices in recent years have contributed to the unprecedented development of machine learning. Regarding image classification, this study intends to artificially extract features, and convert the features of an original image into useful features characterized by lower dimension and less noise. Machine learning has been gaining momentum over last decades. It is a class of artificial intelligence methods, which allows the computer to operate in a self-learning mode, without being explicitly programmed. Neural network is a machine learning algorithm. It is a system of number of interconnected artificial “neurons” which exchange messages between each other. This network consists of numerous layers of feature-detecting neurons. Each layer consists of several neurons that respond to different combinations of inputs derived from the previous layers. Convolutional Neural Network is a specialized context of the neural network which was proposed by Yann LeCun in 1988. It comprises of one or more convolutional layers, often combined with a subsampling layer, which are succeeded by one or more fully connected layers as in a basic neural network. The design of a CNN is triggered by the discovery of a visual mechanism, called the visual cortex, inside the brain. Each feature of a layer receives numerous inputs from a group of features located in a small neighbourhood which again reside in the previous layers called as local receptive fields. With these local receptive fields, features can extract primitive visual features, such as core, oriented edges, corners, end-points, etc.,

which are later combined by the higher layers. One of the most important uses of this architecture is Image Classification. In many cases, features derived from the top layer of the CNN are resorted for classification; however, those top layered features may not contain enough or required useful information to predict an image appropriately. In some instances, features acquired from the lower layers carry more distinctive power than those derived from the top. Hence, applying features from a particular layer only for classification seems to be a process which does not utilize deep CNN’s potential discrete power to full of its extent. This innate property leads to the demand for fusion of several features from multiple layers.

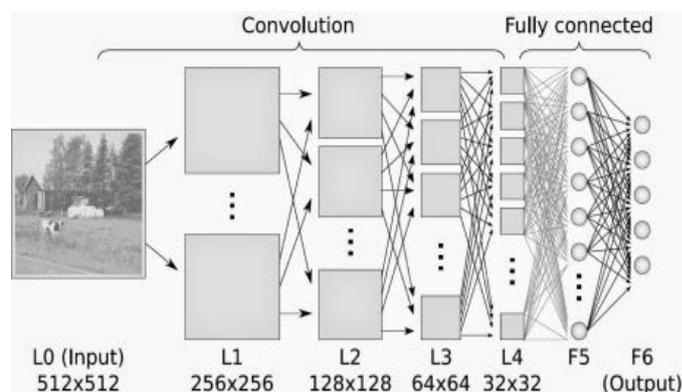

Fig. 1. Convolutional Neural Networks

While neural networks and various other pattern detection methods have been prevalent, there is a significant development in the field of convolutional neural networks. This is because of its ruggedness to shifts and distortions in the image, fewer memory requirements, easier and better training. The image input is passed through a series of convolutional, pooling, flattening and dense fully connected layers, and then the output is generated. In this paper we will be studying about layers of convolutional neural networks and its implementation in real-time.

II. RELATED WORK on IMAGE CLASSIFICATION using CNNs

Convolutional Neural Network has become the most successful deep learning model in the computer vision industry. In recent years, deep learning has been quickly promoted in the machine learning industry, and remarkable theoretical and practical achievements have been continually attained. The development of deep learning can be divided into three stages. From the 1940s to the 1960s, deep learning was called the control theory. While the theoretical development of biological learning and the establishment of the perceptron triggered the first wave of interest in artificial neural networks, as the perceptron could not be used to learn linearly inseparable data, it was resisted by many researchers, which resulted in the low ebb of the first stage. The second wave started with connectionism in 1980 and ended in 1995. In 1974, Paul Werbos proposed the back-propagation algorithm, and solved the problem of linear inseparability in the neural network model. However, as the quantity of training data was small, and the performance of the computers was poor at that time, there was a serious problem in most of the deep learning models - overfitting. At the same time, great progress was made in other machine learning fields. Consequently, deep learning was neglected by most people, which marked the low ebb of the second stage. In 2006, Hinton and Salakhutdinov displayed a neural network model called the autoencoder in the magazine Science. By adopting an unsupervised learning algorithm to initialize networks layer by layer, they efficiently improved the generalization of the deep network. Since then, many researchers have used the same method to revitalize a large number of the deep learning models, which were challenged in the 1980s. This marked the entry into the third wave of deep learning. Based on the visual system, the convolutional neural network (CNN) is a neural network used exclusively to process data with a lattice structure. In 1959, Hubel and Wiesel discovered the visual cortex cells of mammals and proposed the concept of a partial receptive field. Inspired by this, Fukushima and Kunihiko put forward Neocognitron in 1984, which can be regarded as the prototype of the modern convolutional network. In the 1990s, LeCun published relevant papers to define the modern structure of CNN and improved it afterwards. LeNet-5 is the first convolutional network that could be applied in reality. With little pre-processing, the network can directly learn the number image classifications in the original pixels. However, the training data were inadequate, and the computation ability of the computer was weak; thus, LeNet-5 was not effective in handling complicated problems. In 2009, Le integrated the convolutional neural network with the deep belief network to form the Convolutional Deep Belief Network (CDBN). In 2012, Krizhevsky adopted AlexNet to bring the error rate of image classification down from 26.3% to 15.2% in ILSVRC-2012. In 2014, a Google team used GoogLeNet to achieve a lower error rate (6.67%) in ILSVRC-2014. In 2015, the convolutional network of Microsoft MSRA brought the error rate of the ImageNet 2012 data concentration down to 4.94%, thus, surpassing humans in terms of recognition.

III. SYSTEM MODEL

Python Code is used for this project. As a framework we implemented Keras, which is a high-level neural network API written in Python. It can't work by itself, it needs a backend for flow-level operations. Thus, we installed a dedicated software library called Google's TensorFlow. As a development environment we used Jupyter Notebook and Matplotlib for visualization. For network training and testing we can download the dataset of images. This is done by creating an environment using Anaconda software. We can also enhance it by using Object Detection packages supported by python i.e., ImageAI object detection class.

IV. PROBLEM STATEMENT

The human visual system perceives the world in a different manner than digital detectors imposing various additional noise and bandwidth restrictions. Human optical illusions distort and fabricate features due to fundamental properties of human visual perception. Moreover, the memory of humans might be huge but ability to use it might lack. If there are hundreds and thousands of pictures that are to be studied, then it can be digitally possible at ease while it can be a very difficult task manually. The underlying features of the images, distortions, shifts, noise, etc., cannot be easily recognizable by humans. Thus, image classification has been introduced on a digital platform.

V. SOLUTION

Digital image classification utilizes computer-aided enhancement to turn subjective features of an image into data that can be measured, quantified and evaluated. Image processing must be proposed in a manner wherein it must be consistent with the scientific methodologies so that others may use or reproduce, and validate, one's results. To study image processing and understand image classification we will be using convolutional neural networks. The image input is passed as a dataset through a series of convolutional, pooling, flattening and dense fully connected layers, and then the output is generated.

A. Convolution Layer

It is always the first. The image matrix with pixel values is entered into it. Imagine that the reading of the input matrix begins at the top left of image. Next the software selects a smaller matrix there, which is called a filter. Then the filter produces convolution, i.e. moves along the input image. The filter's task is to multiply its values by the original pixel values. All these multiplications are summed up. One number is obtained in the end. Since the filter has read the image only in the upper left corner, it moves further and further right by one unit performing a similar operation. After passing the filter across all positions, a matrix is obtained, but smaller than the input matrix. Whenever the image passes through a convolution layer, the output generated by the first layer becomes the input taken by the second layer. And this happens with every further convolutional layer.

$$T(f(x) \otimes g(x)) = T\left(\int_{-\infty}^{\infty} f(x)g(u-x)dx\right)$$

$$= \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x)g(u-x)dx \exp(2\pi i s u) du$$

Fig. 2. Convolutional Theorem

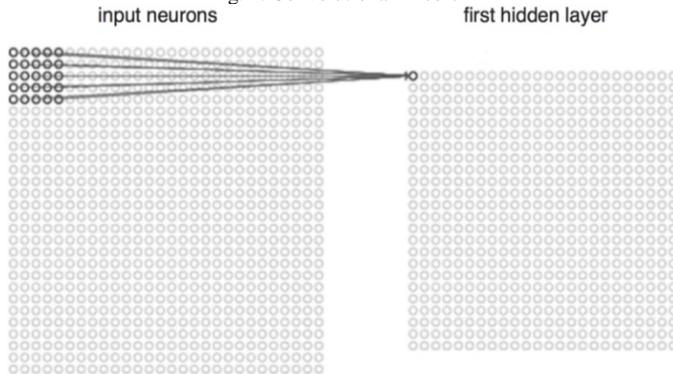

Fig. 3. Convolutional Layer

B. Pooling Layer

It follows the convolutional layer. It works with width and height of the image and performs a down sampling operation on them. As a result, the image volume is reduced. This means that if some features have already been identified in the previous convolution operation, then a detailed image is no longer needed for further processing, and it is compressed to less detailed pictures.

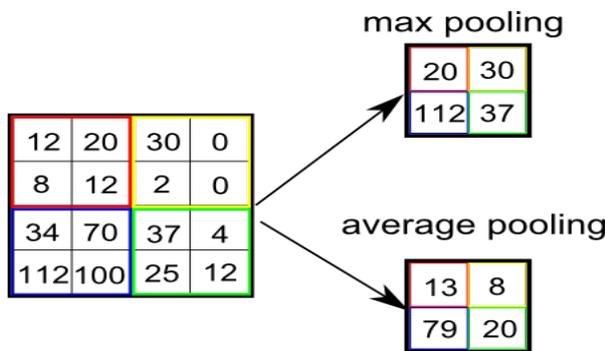

Fig. 4. Pooling Layer

C. Flattening Layer

After the convolution and pooling layers, our classification part consists of dense fully connected layers. However, these fully connected layers can only accept One Dimensional data. To convert our 3D data to 1D, we use the flattening layer.

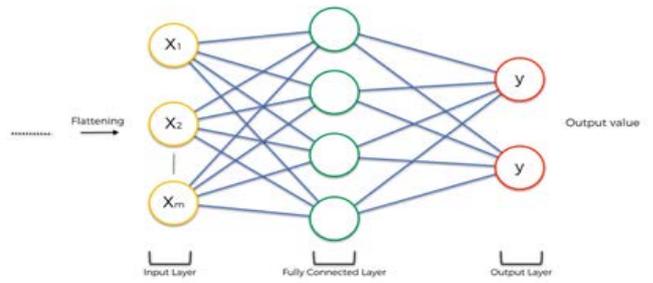

Fig. 5. Flattening Layer

D. Dense Fully Connected Layer

After completion of the mentioned series of layers, it is necessary to attach a dense fully connected layer. By appending a fully connected layer at the end of the network will result in an N-Dimensional Vector, where N represents the number of classes from which the model opts the desired class. Neurons which are in a fully connected layer will have full connections to all the activations occurred in the previous layer.

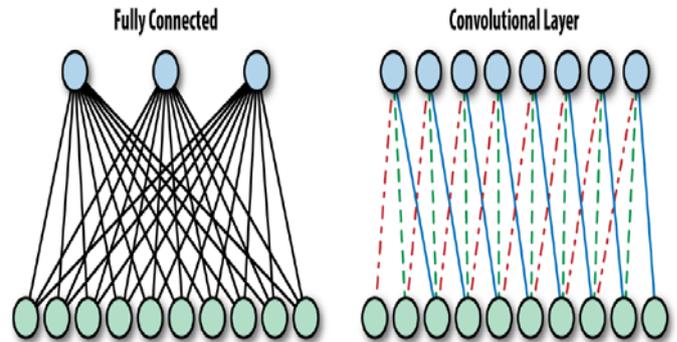

Fig. 6. Dense Fully Connected Layer

VI. ANALYSIS

The basis of the model is Supervised Machine Learning. It is one of the ways of machine learning where the model is trained by input data and expected output data. It is tested and evaluated. To create such model, it is necessary to go through the following phases: model construction, model training, model testing and model evaluation. Model Construction depends on machine learning algorithms. In this project's case, it is convolutional neural networks. Before model training it is important to scale data for the further use. After model construction it is time for Model Training. In this phase, the model is trained using training data and expected output for this data. Progress is visible on the console when the script runs. At the end it will report the final accuracy of the model. Once the model has been trained it is possible to carry out Model Testing. During this phase a second set of data is loaded. This data set has never been seen by the model and therefore it's true accuracy will be verified. Finally, the saved model can be used in the real world. The name of this phase is Model Evaluation. This means that the model can be used to evaluate new data.

The datasets of cats and dogs were considered. The aim was to classify the images of cats and dogs. The Training Set has 800 pictures of cats and dogs. The Test Set has 200 pictures of cats and dogs. Given any image we must classify whether it is a cat or a dog. As a result of testing the model, we got a very good accuracy: 93.8% of correct classification samples after 32 epochs. The only drawback was that we had to wait about 30 minutes until 32 epochs come to the end. If the training data accuracy (acc) keeps improving while the validation data accuracy (val_acc) gets worse, we are likely in an overfitting situation, i.e. your model starts to basically just memorize the data. Consequently, this model is sufficient to train on 10 epochs. The model can still be optimized to get 100% accuracy by introducing new techniques into the model.

for a successful training of the model. The scope can be extended to try this model on more data sets and apply it to practical tasks in order to see how a higher efficiency can be achieved in various problems.

ACKNOWLEDGMENT

This project work was supported by Information Technology Department and encouraged by our Institution VNR Vignana Jyothi Institute of Engineering and Technology.

VII. CONCLUSION

From this project, we can figure out what deep learning is. We can construct, assemble, train, test and evaluate the Convolutional Neural Networks Model to classify images of cats and dogs or any image. This model works well with small number of images and we can measure how the accuracy depends on the number of epochs in order to detect potential overfitting problem. It is determined that 10 epochs are enough

Impact of Employees' Training and Development on Organizational Performance: A Case of the National Bank of Commerce (NBC) Mwanza City

Gipson Raphael Ole Kinisa

Institute of Accountancy Arusha, Department of Business Management, P.o.Box 2798, Arusha

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9262>

Abstract- The success of an organization is dependent on its human resources. Employees' training plays an important role as it enhances efficiency of an organization and helps employees to boost their performance and that of the organization. The purpose of this research was to investigate the impact of employees' training and development (T&D) practices on organizational performance in Tanzania banking industry, a case of NBC bank in Mwanza city. It was further guided by four specific research objectives: (i) To identify how training needs analysis is conducted at NBC bank in Mwanza city, (ii) To determine the T&D practices and procedures at NBC bank in Mwanza city, (iii) To determine the T&D methods used on employees at NBC bank in Mwanza city, and (iv) To determine the effect of T&D programs towards employees' and organizational performance at NBC bank in Mwanza city.

The research surveyed 75 employees from three NBC bank branches in Mwanza city using a self-administered structured questionnaire. Personal interviews were also held with some management and ordinary staff of the bank. The results from the study indicate that NBC bank conduct TNA before running T&D programs. Most of the training facilitations for non-managerial employees were on job-training, while management mostly off job training.

The findings reveal that training practices and methods were reasonably planned and systematic in nature and followed although some employees were not satisfied with some of the training methods used such as lecture type and role play techniques. Nevertheless, most of the employees were of the view that T&D programs are effective tools at individual and organizational level. The study also found that although employees are trained on-job training with different methods, they prefer mentoring and coaching as well as job rotation because these methods help them in acquiring skills and knowledge to effectively and efficiently perform their specific daily tasks. Employees indicated that T & D programs have improved their skills and capabilities. Overall, the T&D programs resulted in to improved employees' job performance as well as overall organizational performance. The study recommends among other things, that a more systematic process in training be followed, NBC bank incorporate outcomes of yearly performance appraisal into employees training programs and initiate a motivation policy attached to training.

Index Terms- Training is a learning experience in that it seeks a relatively permanent change in an individual that will improve his or her ability to perform on the job. Training can involve the changing of skills, knowledge, attitudes, or social behaviour (Decenzo and Robbins, 2002).

Development is a learning process that is not often related to the current role of an employee in an organization, it rather prepares employees for other positions in organizations by improving their abilities and responsibilities of the current job (London et al., 1989).

Performance management refers to the process of ensuring that employees' activities and outputs match the organization's goals (Armstrong 2014)

Performance is the act of performing or doing something successfully, using knowledge or skills as opposed to just possessing it (Armstrong 2014).

On-the-job training (OJT) is an employees' training at a place of work, while he or she is in the actual job (Gomez-Mejia et al, 2001). Armstrong (2014) further defines OJT as teaching the skills, the knowledge and competencies that are needed by employees to perform a specific job within the workplace and work environment. OJT is usually for jobs that do require large amount of pre-existing knowledge.

Off-the-job training is a method of training, which is organized at a site, far from the original work environment for a specific period (Armstrong 2014).

I. BACKGROUND OF THE STUDY

Training and development ought to be part and parcel of organization's strategic plan. It is an indispensable strategic tool for enhancing employees' and organizational performance. Companies that aim at competitive advantage have realized the importance of training, improving employees' performance (Becker 1999; Afroz 2018). Indeed, among the most important functions of human resource management, the crucial function is employees' development through proper training and development programs.

Training can be defined as a systematic process of acquiring knowledge, skills, abilities and the right attitudes and behaviors to meet job requirements (Gomez-Mejia et al 2007). Training has been reckoned to help employees do their current jobs or help them

meet current performance requirements by focusing on specific skills required for the current organizational needs. The benefits of training employees may extend throughout a person's career and help that person's future responsibilities. This training therefore ought to look at both current and future needs of the organization.

Researchers as Swart et al, (2005) indicate that an individual's improvement will be contingent on the quality of the training program, the motivation of the individual and the individual's needs. The model of improved organizational performance in general assumes that employees' knowledge, skills and attitudes will change by the adoption of a training program. If the employee believes there is an improvement in their knowledge and skills, there will be an increase in the person individual's performance, which subsequently leads to improved organizational performance.

Furthermore, Cole (2004) attributes employees' training and development as prerequisite for the organizational performance. When an employee is performing poorly, it is not purely individual's fault but rather because that person lacks necessary skills, knowledge, and commitment to do the job well. However, the employee is not the sole factor but rather there are other myriad factors that attribute to one's performance, such as psychological factors and motivational factors just to mention a few, though from skills perspective, training is the major attribute towards individual performance. Thus, the issue of well trained and competent personnel is paramount for any organization to realize full potential of labour force at work, which ultimately impact on organizational performance.

In the banking industry, human resources knowledge, skills and expertise are crucial assets that drive productivity and performance. This is because, as a service industry, the service provided by the bank is delivered through its personnel while it is being consumed sometime by its customers. Thus the bank personnel stand for the service and display to the customers the value and quality of the bank's service. Consequently, Aryee (2009) argues that banks need exceptional human resources to present their service to customers in a manner that will win more customers, keep them, and sustain its profitability. Therefore, training is crucial to any bank in Tanzania that seeks to improve its performance and competence of its employees.

In spite of these stated advantages of training and development, into some organizations have failed to integrate training and development into the organization systems. As a result, training and development seem to have less significant on the organizational performance. Some organizations meet their needs for training in an ad hoc and haphazard manner, which results into employees' failing to apply their best efforts to achieve organizational goals, and show high performance on job. Training and development is very important for an organization to compete especially in today's challenging and changing world.

Statement of Research Problem

This study starts from the realization of the need to effectively administer the impact of job and training and development (T&D) on organizational performance. It is well known that training enhances knowledge, skills and ultimately improves workers' and organizational performance and productivity (Cole 2002). According to KCM (2014),

ineffectiveness of training and development reduces the organizational productivity. Hence it matters how T& D is carried in the organization. Many organizations in Tanzania especially in private sector engage in training of their staff and have departments or units in charge of training. NBC bank is one of such organizations that train their employees. However, it is not clear whether training at NBC is haphazard and whether several employees have not qualified for any form of training nor is there any systematic process of staff development in place for their training. Little is known as to whether T&D program/practice at NBC bank has contributed to the organizational performance (productivity and portability). It is in this regard that the researcher set out to conduct this study.

Specific Objectives

The study was guided by the following specific objectives; to identify how training needs assessment is conducted at NBC bank in Mwanza City, to determine the training and development (T & D) practices and procedures at NBC bank in Mwanza City, to determine the training and development methods used on employees' at NBC in Mwanza City and to examine the effect of training and development programs toward employees' and organizational performance at NBC bank in Mwanza City.

II. LITERATURE REVIEW

Training Purpose, Process and Outcomes

Cole (2002) states that training is more of a learning activity to acquire better skills and knowledge needed to perform a task. Cole further argues that the idea of training is the need for a greater productivity and safety in the operation of specific equipment or the need for an effective sales force, to mention a few. Therefore, to come up with the desired knowledge, skills and abilities from employees to perform well at their job side, it requires proper training programme that may likewise have an impact on employees' motivation and commitment to their job as further Cole points out given that employees are the most important asset of the organization, they can either build or break their company's reputation as well as profitability. Additionally, employees oversee most of the activities which can influence customer fulfillment, the nature of the product and event. It is with this understanding that any organization ought to look at training as investment strategy.

Why Training ?

According to Nunvi (2006), training programs are directed towards maintaining and improving current job performance while development seeks to improve skills for future jobs. Considering the progress in the technology, certain jobs become redundant with the replacement of machines in modern days. In that vein, further education and competence become necessary for those employees in current positions and those wishing to be promoted in the future. Expressing an understanding of training, Armstrong (1996) emphasizes that training should be developed and practiced within the organization by appreciating learning theories and approaches, if training is to be well understood.

Training Process

According to Infante (2015), training in an organization generally involves a systematic approach, followed by a sequence of activities or process which is based on three to four blocks:

(1) Identifying Training Needs

Identifying training needs is an analysis that is necessary to determine the training needs of the employees or a specific job. What are the practical needs? Why an employee needs training? Every training begins with the need analysis and establishing a need analysis is and should always be the first step in the training process (Infante, 2015). There are four procedures that managers can use to determine the training needs of employees in their organizations:

- i. Job requirements analysis. The skills and knowledge specified in the appropriate job description are examined. The employees without the skills needed are candidates for a training program
 - ii. Organizational analysis. The effectiveness and successes of an organization are analyzed to determine where differences exist. For instance, members of a department with a high turnover rate or a low performance record might require additional training.
 - iii. Performance appraisals. Here, each employees work is measured against objectives established for his or her job.
- i v . Human resource survey. In here Human resource policies, procedures, guidelines and practices such as performance, turnover, employee satisfaction and many other.

Managers as well as non-managers are expected to describe what problems they are experiencing at their workplaces and what actions they believe can be taken to solve the problems. Immediately the training needs are identified, the human resources department must initiate the appropriate training efforts to close the gap between expected and actual results. This may also depend on circumstances such as developing a training plan, designing a training lesson, selecting trainees and preparing the trainers.

(2) Training Plans and Implementation

This area of the training process emphasizes on the techniques and methods by which training is carried out. The objectives of training, budgets and the duration are allocated.

(3) Training Evaluation and Feedback

Often, training evaluation and feedback turns to be the most critical part of the training process, focusing on the results achieved after training. The main idea is to analyze the effects of training and determine whether the set goals have been achieved. Reactions such as the participant's feedback, trainer's feedback, learning behavior and results of the training are being measured.

To measure the impact of training, Kirkpatrick (1959) outlined four levels of evaluation, and each of which is a prerequisite for the next level:

Reaction and Planned Action: These are measured reactions or evaluations of how the employees feel concerning the learning experience.

Learning and confidence evaluation: This is the measurement of the increase in knowledge after training.

Behavioral impact: This is the degree of applied learning back at work – are the members really doing anything diverse after the training program than before?

Results: It is important to know what results are achieved, in relation to the previous training objectives that were being set. For instance, has there been any decline in the number of costumers' complaints? Reactions, behaviour and learning are of great importance, but if the training program cannot produce measurable performance – related results, then it has not achieved its goals accordingly.

Benefits of Training and Development to Employees

Several paper works have been presented on the topic of training and development; it is evident that there is a positive effect of training and development activities on employees' performance. Other effects that can be geared by training may be motivation, behavioural and many others.

Arthur et al. (2003) performed a meta-analysis and from the study training had a positive impact on job related attitudes. Further it is obvious that the effectiveness of training depends on the training delivery methods and the skills to be trained. For instance the effective training programs include interpersonal skills and cognitive theory then followed by tasks related skills

Methods of Training and Development

A variety of training methods are used in different organizations today to train different individuals of different levels and positions. DeCouza et al (1996) explain that the most popular training and development methods used by organizations can be broadly classified as either On-the-job or Off-the-job training.

On- the- Job Training

On-the-job training (OTJ) is a method of giving training to employees when they are at work in their working environment. The purpose of this training is to make the employees get familiar with the normal working circumstances; that is during the training time frame, the workers direct involvement to practice or use machinery, equipment, devices, materials, and so forth in which they are being trained. Additionally, it helps the employees to figure out how to address the difficulties that may occur during the execution of the job, with the new skill or competence. The main idea of this training is learning by doing where the supervisors or the more experienced employees show the trainees how to perform a specific task. The learners (trainees) take on the instructions/directions of the supervisor and perform out the task. In other words, the trainees get the opportunity to practice on the spot.

This training method is highly used by companies to train current and future workers due to its simplicity. On-the-job training includes apprenticeship, coaching, internship, job rotation, job instruction, and few others.

Gomez-Mejia et al (2001) define on-the-job training (OJT) as an employees' training at a place of work while he or she is performing the actual job. Armstrong (2014) defines OJT as

teaching the skills, the knowledge and competencies that are needed by employees to perform a specific job within the workplace and work environment. OJT is usually for jobs that do require large amount of pre-existing knowledge.

OJT is mostly one-to-one although it might involve several trainers to many trainees as a team, an environment in which the trainees will need to practice the knowledge and skills being taught on job training. In most cases, a professional trainer or sometimes an experienced employee within the organization or supervisor or manager serves as the trainer/course instructor.

The purpose of this OJT training is to make the employees get familiar with the normal working circumstances, that is during the training time frame, the workers get direct involvement to practice the skill or use machinery, equipment, devices, materials and so forth, in which they are being trained.

Banks such as NBC bank utilizes these approaches especially to train its operational staff such as tellers, loan officers and customer service personnel.

There are three common methods that are used in on-the-job training; namely, learning by doing, mentoring/coaching, job rotation/shadowing, and job instruction

(i) Learning by Doing

Learning by doing is a very popular method of teaching new skills and methods to employees who have just been hired or are moving to different position. Under this method, an employee observes a senior experienced worker and learns what to do. The advantage here is that this method is tried and tested and fits the requirements of the organization. The disadvantages are that the senior worker is not usually trained in the skills and methods of training; therefore, it can be a process that may be time consuming as a new comer struggles to cope with the senior worker's explanations. To increase its success, it is recommended to use a senior or experienced worker who has been trained in instruction or training method and whose teaching skills are coordinated with a developed program linked to off-the-job courses.

(ii) Mentoring/Coaching

According to Anthony et al (1993), mentoring is a technique that assigns a guide or knowledgeable person high up in the organization to help a new employee "learn the ropes" of the organization and to provide other advice. In line with that, Beardwell and Holdern (1994) state that, this is another version of the system whereby a senior or experienced employee takes charge of the training and development of a new employee. Schuler and Huber (1993) point out that mentoring as a method of training is a regular part of the supervisor's job. It includes day-to-day coaching, counseling, and mentoring of workers on how to do the job and how to get along in the organisation. The effectiveness of coaching, counseling and monitoring as techniques for training and development depends in part on whether the supervisor creates feelings of mutual confidence, provides opportunities for growth to employees and effectively delegates' tasks. Mentoring programmes, in which an established employee guides the development of a less-experienced worker or 'protégé,' can increase employees' skills, achievement, and understanding of the organization.

(iii) Job Rotation/Shadowing

As indicated by Cherrington (1995), job rotations are learning techniques that are usually reserved for managerial and

technical occupations. Movement from one position to another provides managers with exposure to a number of different job functions and a broad grasp of the overall purpose of an organization. Job rotation programmes are used to train and expose employees to a variety of jobs and decision making situations. Although job rotation provides employee exposure, the extent of training and long-run benefits it provides may be overstated (Schuler and Huber, 1993).

(iv) Job Instruction Training

Schuler and Huber (1993) assert that job instruction training was developed to provide a guide for giving on-the-job skills training to white and blue-collar employees as well as technicians. It provides such systematic technique which rather makes it flexible for both off-the-job and on- the-job programmes. It has been the most popular method of training for blue-collar and white-collar employees since it was first described by the war manpower board during World War II. Before the actual learning occurs, job-instruction training requires a careful analysis of the job to be performed, an assessment of what the trainees knows about the job, and a training schedule. Training begins with introductory explanation of the purpose of the job and a step-by-step demonstration by the trainer of the operations. After the trainer has demonstrated the job enough times for the trainee to comprehend the steps, the trainee is given the opportunity to try it alone (Cherrington, 1995).

Off-the-Job Training

Off-the-job training is another method of training, which is organized at a site, far from the original work environment for a specific period (Armstrong 2014). The purpose of this method of training at a place other than the job area is to give a peaceful domain to the employees where they can focus just on learning. Learning material is provided to the trainees for a complete theoretical knowledge. The trainees can express their perspectives and opinions during these training sessions. Additionally, the trainees can investigate new and innovative ideas. The methods in the off-the-job training are case studies, conferences, audiovisuals, seminars, simulations, role play exercises, and lectures in classroom settings.

One advantage of off-job-training is that it gives employees extended uninterrupted periods of study. Another advantage is that a classroom may be more conducive to learning and retention because it avoids the distractions and interruptions that commonly occur in an OJT environment. However, off-job-training has also disadvantages. One big disadvantage is that what is learnt in a classroom is not the workplace and the situation simulated in the training may not closely match those encountered on the job. Also, if employees view the off-the job training as an opportunity to enjoy some time away from work, not much learning is likely to take place. Furthermore, off-the-job training is one of the costly training methods and care has to be taken as who goes for training and level of competences desired to be acquired in line with organization training and development policy (Armstrong, 2004). In general, Banks such as NBC bank utilizes off-job-training to train its technical lower and middle management; most training are designed behavior change and managing changes in the organization.

In brief, off-the-job training generally focuses more on long-term development and general education than on the skills

and information needed to perform a specific job. In this context, Beardwell and Holden (1994) argue that off-the-job training is sometimes necessary to get people away from the work environment to a place where the frustrations and hustle of work are eliminated. This enables the trainee to study theoretical information or new and innovative ideas without interruption. There are different methods used at off-the-job-training and these include vestibule training, behavior modeling, Understudy Training, and case study

(i) Vestibule Training

According to Cherrington (1995), vestibule training is similar to on-the-job training except that it occurs in a separate training area equipped like the actual production area. The training that occurs in a vestibule is usually some form of job-instruction training. In vestibule training, however, the emphasis is on learning as opposed to the emphasis on production in job-instruction training. Vestibule training is typically used for teaching specific job skills and is conducted out of the job in an area separate from the work place under the supervision of a skilled instructor. In being consistent with the above, Decenzo and Robbins (2002) state that vestibule training helps employees learn their job on the equipment they will be using, but the training is conducted away from the actual work floor. Vestibule training allows employees to get full feel for doing task without “real-world” pressures. Additionally, it minimizes the problem of transferring learning to the job, since vestibule training uses the same equipment the trainee will use on the job. Furthermore, after going through the vestibule training for a specified time period, the trainees are expected to apply their newly acquired skills when they are assigned to their real job.

(ii) Behavior Modeling

The use of behavior modeling is based on social theory, and it is in particular an effective method for interpersonal or social skills training. This method of training incorporates the use of videos to clearly demonstrate the way things ought to be done, and what behaviors are to be avoided (Babbie, 1998).

Behavior modeling is often based on the demonstration of the right and effective way to behave and as a result, trainees are provided with facilities to practice this. Bryn (1990, p.17) puts it this way, that behavior modeling is where target behaviors are selected and videos on each of the behaviors produced, showing competent persons achieving success by following specific guidelines. Key points are displayed on screen and are backed by trainer-led discussions. Learning here is trainer enforced through role play.

(iii) Understudy Training

An understudy is a person who is being trained to assume a particular position on a future date, the duties and responsibilities of the position currently occupied by the person himself or herself in understudying. In this method, an individual or group is assigned to assist a superior officer in the performance of his/her duties related to the position and at times left to grapple with the day-to-day problems which confront the superior in the performance of duty. The trainees are allowed to solve them with or without the help of the superior. When the understudy shows promise of talent, he/she takes over when the superior is transferred, retired or is promoted to a higher position (Decouza et al, 1996, 70).

(iv) Case Study

Cherrington (1995) declares that case studies are used extensively in many business classes. They are designed to promote trainee’s discovery of underlying principles. Most cases do not have single correct solution. Instead a trainee is expected to analyze the problem and consider alternative solutions or give an opinion. Case studies may be of real or imagined events in organization which to study. After analyzing several cases under the guidance of instructors, the trainees are exposed to certain concepts, problems, techniques and experiences, which they will later face on the job. The object of this method is to help the trainees think logically and develop the ability to analyze alternative courses of action systematically and objectively.

(v) Business Exercise/Simulation/Role Play

Under this type of training exercise, the work situation is simulated and the trainees are presented with reports, correspondences and memoranda, as in a real work situation, to handle. Business exercise training helps employees to develop decision-making, time management, planning and communication skills. It also helps the trainees to develop a “feel” for the work situation before they take on the real job (Laing, 2009)). Simulation is very similar to vestibule training and is used extensively for learning technical and motor skills. The essence of role-playing is to create a realistic situation as in the case of discussion method, and then have trainees assume the parts of specific personalities in situation.

(vi) Conference /Group Discussion

A method of individualized instruction frequently used where the training involves primarily the communication of ideas, procedures, and standards in the conference or discussion method. This conference/group discussion method allows for considerable flexibility in the amount of employee participation (Bohlander and Sherman, 1992). Again, Anthony et al (1993) argue that all training programmes, particularly outside programmes, utilize this technique. It has the advantage of being spontaneous and allows the participants to become involved in exploring concepts and in seeking clarification.

Cherrington (1995) states that conference and group discussions, used extensively for making decisions, can also be used as a form of training because they provide forums where individuals are able to learn from one another. Many studies have shown that individual are much more inclined to change their attitudes if they participate in a group discussion and at a group consensus regarding a topic than if they listen to lecture. An example of group discussion that can be an effective means of training is one in which supervisors discuss the performance evaluation procedure and develop common criteria for evaluation performance.

(vii) Sensitivity Training

As stated by Decenzo and Robbins (2002), sensitivity training in “encounter group” became quite popular during the 1950s as a method of changing behaviour through group processes. Often referred to as laboratory training, it influences the participants through unstructured group interaction. Members are brought together in a free and open environment in which participants discuss themselves and their interactive process, loosely facilitated by a professional behaviour scientist. This professional then creates the opportunity for the participants to express their ideas, beliefs, and attitudes. In the same instance, this type of training consists of unstructured group discussion in which

the participants talk about their personal feelings and reactions towards each other. The length of a laboratory training session may vary from as little as a couple of hours to as much as two or three weeks of all day sessions. The training is designed to create greater self-awareness and increased sensitivity to the attitudes and emotions of others and to group processes (Cherrington, 1995). Similarly, Schuler and Huber (1993) state that individuals in an unstructured group discussion exchange thoughts and feelings on the "here and now" rather than the "there and then". The experience of being in sensitivity group often gives individuals insights into how and why they and others feel and act the way they do.

(ix) Lecture

The lecture is an efficient means of transmitting large amount of factual information to a relatively large number of people at the same time. It is the traditional method of teaching and is used by organizations in many training programmes. A skilled lecturer can organize material and present it in a clear and understanding way. If the trainees are ready to receive it, a well prepared lecture may succeed in transferring conceptual knowledge. However, a lecture does not allow active participation by the learners. It provides no practice, no feedback, no knowledge of results, and it may inhibit the transfer of learning (Cherrington, 1995).

Anthony et al (1993) underscore that lecture method is very useful for large groups. It requires a training leader who is dynamic and who can organize and present materials in an effective fashion. For best use, it should be supplement with additional types of training techniques.

According to Decenzo and Robbins (2002), the lecture approach is well adopted to conveying specific information, rules, procedures, or methods. The use of audio visual can often make a formal classroom presentation more interesting while increasing retention and offering a vehicle for clarifying more difficult points.

Comparison of on-the-Job and Off-the-Job Training

A critical comparison of various methods for training and development of staff, on-the job training method, and the emphasis is more on the acquisition of specific, local knowledge in a real situation. In contrast, off-the-job method emphasizes developing an understanding of general principles, providing background knowledge, and generating an awareness of comparative ideas and practices. There is no best method of training. The choice of the method whether on the job or off the job training depends on several factors including the objective of training, length of training, employees position and allocated budget.

Training and Development Experiences from Tanzania

Training and Development of employees ought to be part and parcel of an organization's strategic plan because employees are the most important asset of any organization. Some countries take T & D seriously and it is from this mindset they have been able to achieve employees' sustainable high productivity and excellent good organizational performance. In Tanzania, there are mixed experiences and few studies have been conducted on the topic in public sector and next are experiences about training and development and their linkage to employees' and organizational performance.

Kihongo (2011) from Institute of Social Work (ISW), Dar es Salaam conducted a study on Factors Inhibiting Effective Staff Training in Tanzania. He identified various factors which undermine staff training in Tanzania's local authorities. These stumbling blocks include lack of funds due to inadequate budgets set aside for staff training, malpractices such as favoritisms, poor top management support because some managers do not treat staff training as a matter of priority, the absence of viable training policies and training programmes initiated by the local authorities, and the fragmented nature of the staff training.

Dominic and Kessy (2010) undertook a study on Effectiveness of Training and Development Programs in Public and Private Sectors. They found that training as a human resource development function was not being implemented well in Tanzania and most organizations lacked guidelines for effective employees' training. In addition, the review paper found that there was still a need to change the methods of training that are not effective and provide more methods of practical nature, since some organizations did not have comprehensive policy to guide an appropriate implementation of training programme nor adequate efforts to make them aware of its function; then the HR department should strive to design an effective policy and involve all respective employees in its implementation. The question raised is how the organization realizes the contribution and/or returns of training on its overall performance when it does not have clear training and development policy or programs.

The study further revealed the comparison between the real and ideal T&D program, minimal effort has been put out to bring the T & D program to standard. To enhance effective improvement of the training programmes, it is important to: (i) Develop a more uniform TNA exercise that aims to improve the level of efficiency of training function and eventually have clarity in scope and objectives, (ii) Conduct evaluation after every training session and give feedback to the trainees, (iii) Prioritize the issue of increasing employee capacity by allocating adequate training budget, (iv) Implement training function openly and involve every individual in determining the kind of training they need, and (v) Follow the criteria of sponsoring employees to training programs.

Mwaibako (2013) in his research on training and development and organizational performance in Tanzanian Commission for AIDS focused on perception of employees in terms of training and development programs at TACAIDS, effects of employees' training on performance of the organization and the challenges facing TACAIDS in providing training to its employees. The study revealed that training and development has improved organizational performance through new ideas and skills that have been introduced to the organization after the training. However, training and development at TACAIDS faces various challenges including financial resources and lack of clear policies to promptly promote training and development opportunities. Furthermore, the study revealed that there was no training needs assessment and that led to unsystematic and unplanned training of employees implying lack of clear focus on the value of its employees in enhancing organizational performance.

Hardly any study has been documented or conducted on the relationship between T & D and employees' performance or between T & D and organizational performance in

Tanzania and yet many organization especially commercial banks and telecommunications companies take their employees on various training sessions. So it is fitting that this proposed study being the first in Tanzanian private organizations, might shed light on what extent T & D contributes to employees' productivity and overall organizational performance.

Organizational Performance

According to Chen and Silverthorne (2008), there are three types of performance measurements. Firstly, measurement of output rates e.g. sales volume over a given period of time. Secondly, rating of individuals by another person other than the person whose performance is being measured. Thirdly, self-appraisal and self-rating. Self-appraisal and self-rating techniques are useful in organizations because they encourage employees to set their own targets that are used to measure their performance. Therefore, job performance measures the degree of achievement of organizational and social objectives from the perspective of the judging party (Hersey and Blanchard, 1993).

Companies such as banks use various criteria or performance standards to measure and report performance, such as profitability, market share and sales volume. Also, financial ratio such as current ratio, acid test ratio, gearing ratio and profitability ratios are used to measure the firm's financial performance. Kaplan and Norton (2011), American scholars, have introduced the Balanced Score Card as a more realistic tool for measuring organizational performance.

Given that this research was about the effect of training and Development on both employees' and organizational performance in the banking sector, the researcher adopted two sets of performance measurements (i) employees' performance was measured in terms of efficiency of service delivery and quality of customer services, (ii) organizational performance was measured in terms of deposits growth, loan recovery, and increase in profitability as well as non-financial indicators such as improvement of service delivery and customer satisfaction.

Empirical Literature Review

A number of empirical studies have been carried out on training and development and their effects on organizational performance in various countries and industries. Next is a review of some of the recent studies on the same topic.

The Laing (2009) carried out a study on training and its impact on organizational performance in Ghana. Specifically, the study sought to investigate the impact of Training and Development in public sector organizations using Ghana Ports and Harbors Authority (GPHA) as a case study. The research was intended to determine the role and impact of training on employees, with emphasis on the lower, middle level staff and the administrators of GPHA. A questionnaire was used on a sample of 80 employees of

GPHA. Personal interviews were held with some management staff of the organization. The results indicated that GPHA's employees were not well informed about training and development programmes in the organization. The results of the study indicated that most of the employees were of the view that training and development were effective tools for both personal and organizational success. The findings further revealed that

training practices, methods and activities at GPHA were not in line with the best practices regarding the planned and systematic nature of the training process as is generally known. It was recommended among other things, that the processes involved in training be duly followed, GPHA should assist its staff identify their career paths and guide them in the pursuit of higher education.

Ng'ang'a et al (2013) conducted an empirical study in Kenya on training and development. The purpose of their study was to investigate the relationship between Training and Development (T&D) as a Human Resource Practice and the organizational performance (OP) of the Kenyan state corporations. The study hypothesized that there is a positive relationship between T&D and OP, and therefore the need to investigate how specific the two variables relate. The study adopted an explanatory research design and surveyed a sample of 142 respondents using self-administered questionnaire which constituted structured or closed ended items, unstructured or open ended items and like. The data was subjected to descriptive statistics with the aid of SPSS and correlation coefficients were calculated for initial exploration of the relationships between variables. Furthermore, qualitative data were operationalized by arranging the data according to emerging themes or patterns with assigned numbers to make them measurable. The findings established a positive correlation between training and development and Organizational Performance. From that the study recommended to the authorities of the Corporations studied to put focus onto T&D function to enhance Organizational performance.

Mwaibako (2013) researched on the relationship between training and development and organizational performance in Tanzanian public sector. The aim of this study was to assess the impact of employee training and development on improving organizational performance, Tanzania Commission for AIDS. The study specifically focused on getting the perceptions of employees in terms of training and development programs at TACAIDS, effects of employees' training on performance of the organization, and the challenges facing TACAIDS in providing training to its employees. Purposive sampling was used to obtain 35 respondents. Questionnaires and interviews were used as instruments of data collection.

The study findings showed that there is relatively high level of awareness of the training activities provided by the organization as noted by 81% of the respondents. The training and development has improved organizational performance through new ideas and skills that have been introduced to the organization after the training. However, training and development at TACAIDS faces various challenges including financial resources and lack of clear policies to promptly promote training and development opportunities. Furthermore, the study revealed that there was no training needs assessment and that led to unsystematic and unplanned training of employees. The study recommended that the organization should conduct training needs assessment and gap identification and sponsoring of all training programs should be done through setting aside a budget for employees' training and development and searching for alternative sources of funds instead of being dependent on government sources only.

Maina and Waithaka (2017) were concerned with whether training and development of workers resulted in improved performance in public sector organizations in Kenya. The researchers conducted a study on that topic and the purpose of the

study was to investigate the influence of on-the-job training on performance of police officers in Kenya Police Service. A sample of 85 serving police officers in Imenti South Police Division and a sample of 100 households were used in the study. Two semi-structured questionnaires were used for collection of data (that is, one for police officers and another for households). Collected data were analyzed using Statistical Package for Social Sciences (SPSS) to generate descriptive and inferential statistics which were presented using tables. The influence of on-the-job training on performance of police officers in the Kenya Police Service was analyzed using multiple regression analysis. The findings indicated that on-the-job training has positive but statistically insignificant effect on performance of police officers in the Kenya Police Service and that reduction of the crime in the county could not be attributed only on police training as it is a joint effort by various stakeholders, and besides there are factors such as change of behavior of citizens and increase in economic activities that keep youth occupied.

Athar and Shah (2015) conducted a study on employees' training in commercial banks of Karachi, Pakistan. The purpose of the research was to determine factors that impact training in banks of Karachi, Pakistan and how they affect employees' performance. Data was collected from 100 employees from commercial banks in Karachi city through self-administered questionnaire and employees were selected through random sampling technique. Data analysis was done by regression and correlation techniques that utilized descriptive and inferential statistics. The study found that banks which provide training to their employees in a proper way were able to gain substantial improvement in performance and productivity and resulted into more customers' satisfaction. The study also indicated that for banks where training was compulsory, employees were able to enhance their knowledge, skills and abilities which resulted in provision of extensive support to increase the performance of banks of Karachi. The key findings of the study were stress level and motivation, technical knowledge, training program method, knowledge and employees' performance and motivation had a strong positive relationship with employees' performance. The study recommended that training should be given to all employees to enable them cope with rapid changes in technology, and that banks should launch effective training programs for their employees so that they can easily tackle the challenging situation of working environments.

Oghomhe et al (2016) conducted a study in Nigeria on the relationship between training and employees' performance in banking sector in Edo North Senatorial District. The research specifically examined the impact of training and development on employees' performance in organizations. It adopted a survey research design using a structured questionnaire with a five-point likert scale and surveyed 30 respondents drawn from 5 banks in Edo North. Descriptive statistics was used to analyze the collected data. The findings showed that appropriate training and development of banking staff can result in efficient performance of their functions. Based on the findings, the study recommended that management should define an appropriate training and development programmes for each category of staff who need to be trained and developed.

The study recommended that staff in the banking sector should be helped to grow into more responsibilities by offering them systematic training and development so that they will be

confident enough to carry out the responsibilities of the job. It also recommended that banks should provide performance feedback which will allow staff to be informed of changes to both their work goals and the overall goals of the organization.

Enga (2017) conducted a research on training and development with National Financial Bank, Kumba state, Cameroon. The purpose of the study was to examine the impact of training and development afforded to its workers on organizational performance. The study also emphasized on various training methods designed and their implementation around the world during the training and development programs. The data were collected from a sample of 30 respondents (tellers, customer call centre personnel, loan officers, supervisors and internal control officer) using questionnaire, observation and interview. The research revealed that training and development is a necessity in every company particularly for those who are unskilled or the less experienced employees'. Generally, employees' work contribution was found to be greatly improved due to the training methods and tools used by the company. As a result, it led to a positive impact on employees' performance and an improvement in their skills and job efficiency.

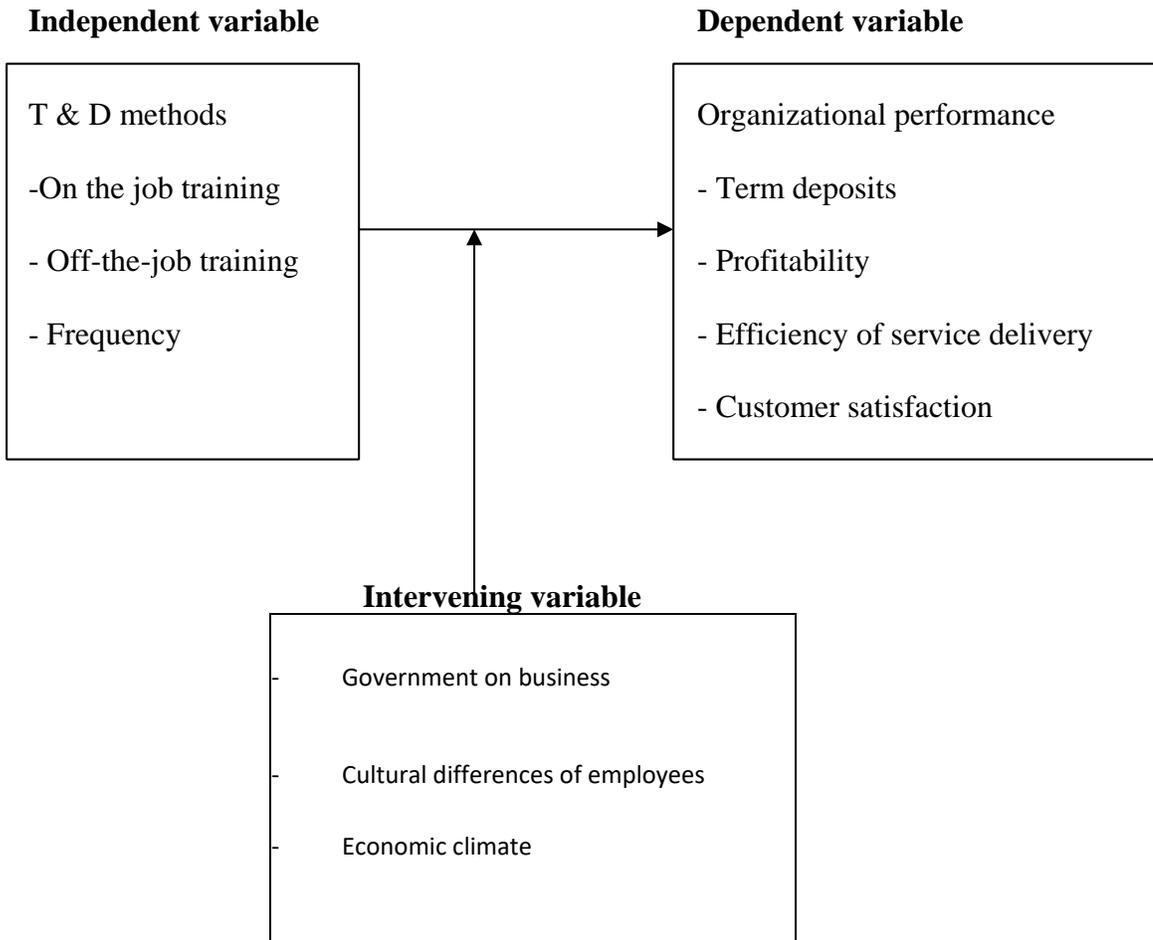

More recently, Afroz (2018) conducted a research in banking industry in Bangladesh. The research aimed at finding out the effects of training on employees' performance in banking sector, Tangail district, Bangladesh. The study surveyed 150 employees of 14 banks using self-administered questionnaire. Data were analyzed using descriptive and inferential statistics. The finding of the study showed that general training enhances employees' engagement, employee motivation and job satisfaction. A strong relationship exists between employee training and employees' performance. The results further revealed that the more the employee gets training, the more efficient their level of performance would be. This research however never related employees' training to organizational performance unlike the present study.

Study Gap

The studies reviewed in literature and revealed that most of the researches on training and development (T&D) in the banking industry focused on its impact on employees' performance (Athar & Shah, 2015; Oghomhe, 2016; Afroz, 2018) except that by Enga (2017) in Cameroon. Furthermore, those studies that link T&D to organizational performance were in public sector organizations (Laing, 2009; Ng'ang'a, 2013; Maina & Waithaka, 2017). The two Tanzanian studies of Kibibi (2011) and Mwaibako (2013) that looked at the relationship between T&D and organizational performance were in public sector organizations, which operate differently from private sector organization. Furthermore, almost all of the studies mentioned looked at training and development and its impact on employees' organizational performance. They did not look at training policy and training methods as their independent variables as is this research. Therefore this study fills in this knowledge gap and examined the impact of employees' training and development practices on organizational performance in Tanzanian banking industry, a case of NBC bank in Mwanza City.

Conceptual Framework

Conceptual framework shows the relationship between independent and dependent variables as well as intervening variables as shown in the following figure.

Source: Researcher (2019)

The independent variables were conceptualized as T&D practices such as training policy and methods of T&D. In contrast, the dependent variables of organizational performance were measured in terms of deposits growth, loan recovery, and increase in profitability as well as financial indicators such as improvement of service delivery and .bank image.

The independent variables of T&D practices such as training policy and methods of T&D were noted in literature to have impact on the dependent variables of organizational performance (Laing, 2009; Ng'ang'a et al 2013; Maina and Waithaka, 2017; Enga, 2017). Other factors (variables) such as government business policy on T & D, cultural differences of employees, and prevailing economic conditions have been taken into consideration because of their moderating effect on the dependent variables. However, these intervening variables were not specifically examined in the study due to their complexity and uncontrollable nature. Besides, this research was not concerned with the impact of moderating variables.

Research design is defined as an arrangement of conditions for collection and analysis of data in a manner that aims to combine relevance to the research purpose with economy in procedure (Kothari, 2008). The research design contains an outline on how the research will be performed; that is to say, it includes the plan on measurement, collection and analysis of data (Creswell 2014). In social science research, there are generally three types of research design that a researcher can adopt; namely exploratory, descriptive and causal research design (Burns and Grove 2003, p. 237). This study adopted a descriptive research design which is concerned with finding out what, where and how of a phenomenon in the study area. This research design was considered appropriate because this study sought to describe how training and development (T & D) of employees contribute to organizational performance at NBC bank in Mwanza city.

Further, this research used primary data that involved questionnaires which entailed both quantitative and qualitative research approaches for better understanding of the phenomenon as has been recommended by other researchers (Creswell, 2014).

III. METHODOLOGY

Research Design

Geographical Area of the Study

The study was conducted in Mwanza city where NBC bank has three branches. Mwanza city is located on the southern shores of Lake Victoria in Northwest Tanzania. It covers an area of 1,325 Km² of which 425 is dry land and 900 Km² is covered by water. Mwanza city has two districts, Ilemela and Nyamagana with a total population of 476,646 (Mwanza City Profile report 2008). The study area was selected due to the fact that NBC being among the performing organizations in Mwanza the researcher thought that the data collected will give a pattern or behaviour of other banks on training and development.

Targeted Population

Target population is the total collection of elements or people, records and so on to which reference can be made (Cooper

and Schindler 2003). That is, it is whole well-defined population or group of objects/ individuals from which the researcher is interested in obtaining information which will be analyzed and from which conclusions will be drawn (Kathori 2008). The specific nature of the target population depends on the purpose of investigation” (Finn et al., 2000, p.108). The target population for this study was 120 staff, which includes three broad categories of respondents: Branch Managers and Section Managers, middle management and bank officers. Details of the specific designation are shown in Table 3.1. From the selected study area the target population was 120 staff and they were classified into two groups; namely, management and no management staff.

Table 3.1 Target Population of the Study

S/N	Categories of Population by bank branch	Population size
1	Management -Bank Branch 1	2
2	Management -Bank Branch 2	2
3	Management-Bank Branch 3	1
4	Non-Managerial Employees-Bank Branch 1	38
5	Non-Management Employees- Bank Branch 2	38
6	Non-Management Employees- Bank Branch 3	38
	Total	120

Source: NBC Bank HRM Report (March 2019)

Sample Size

Kothari (2008) defines sample size as the number of items to be selected from the universe to constitute a sample. So, in order for the results to be reliable, the sample should represent a small miniature of the population and it is recommended that the sample size should neither be very small nor too large but preferably the one that fulfills the efficiency, reliability, flexibility as well as representativeness of the study.

Although there are several ways of obtaining a sample size such as formula methods and other like 40% rule by Huysamen

(1991), this study opted a statistical table methods of the Krejcie & Morgan (1970) which with a population of 120 staff, a sample size of 92 staff is appropriate and when divided equally (3) approximately 31 (2 management and 29 non-managerial) staff from each NBC bank branch. Table 3.2 shows distribution of sample size from each bank branch

Table 3.2 Population and sample size in the target population

S/N	Categories of respondents by bank branch	Population size	Target size
1	Management -Bank Branch 1	2	2
2	Management -Bank Branch 2	2	2
3	Management-Bank Branch 3	1	1

4	Non-Managerial Employees-Bank Branch 1	38	29
5	Non-Management Employees- Bank Branch 2	38	29
6	Non-Management Employees- Bank Branch 3	38	29
	Total	120	92

Sampling Techniques

Sampling is that part of statistical practice concerned with selection of individual observations intended to yield some knowledge about the population of concern, especially for the purpose of statistical inferences (Kothari 2008). There are many sampling techniques that a researcher can choose and use. This research used two techniques: stratified sampling and purposive sampling techniques to obtain participants/respondents from the target population.

(i) Stratified Probability Sampling

The study used stratified probability random sampling in the selection of respondents for the quantitative data collection because the target population was composed of heterogeneous employees in each of the three NBC bank branches in Mwanza city. That is, bank branch for the purpose of this study was considered as non-homogenous and was a different stratum (Kothari 2008). The sample from each stratum was 31 respondents (2 managers and 29 non-managerial employees).

This stratified random sampling technique was implemented as follows: first, organizing the population in Mwanza city into bank branches and then drawing appropriate sample (31 participants) from each bank branch using the NBC bank HRM data base as the sampling frame by taking every second next person from a list of employees regardless of their position and type of work they do until the desired sample size was reached. This study opted to adopt stratified random sampling because it reduces sampling error (Bell & Waters 2014).

(ii) Purposive Sampling

The researcher further used purposive sampling technique to purposively select a sample of employees/management for in-depth interview. The criteria for selection were focused on the employees who were considered to be information resourceful and were willing to discuss various aspects of T & D and organizational performance in relation to this study. This involved using personal judgment by the researcher's perception that the selected interviewee was in the better position to provide information for the study. This approach is in line with Kombo and Tromp (2006) who suggest that purposive sampling procedure can be used with both qualitative and quantitative researches where the intention of the study is to understand the audience and its behavior.

Data Sources and Collection Methods

Data Sources

The data for this study came from primary and secondary sources. Kothari (2008) defines primary data as data collected afresh and for the first time and thus happen to be original in character. In this study, various methods were used to collect primary data and these included self-administered questionnaires and in-depth interviews (Babbie 2008; Creswell 2014).

Secondary data are the data that already exist in published reports, company reports, books and internet (Saunders et al, 2009). The study also used secondary data in collecting information. The secondary data, which constitutes other sources of data were gathered from the NBC bank corporate plan, its Human Resource Management policy, industry magazines/statistics, bulletins, in-house newsletters, annual reports on training, books and journals on Human Resource Management, training and development (Kothari 2008). This helped to identify how others have defined and measured key concepts, and to assess how this research project is related to other studies.

Data Collection Methods

(i) Questionnaires

The first primary data collection method used in this study was questionnaire and was used to collect data of quantitative nature. The researcher formulated questionnaire which focused on employees' characteristics as well as providing respondents with an opportunity to indicate the level of agreement/disagreement on different aspects of training and Development (T&D) practices employed by the three NBC bank branches in Mwanza City and their contributions towards organizational performance. The questionnaires included two types of questions of multiple choice/close-ended and a few open ended questions. In closed ended questions, respondents were restricted to a series of pre-determined answers from which to choose. In open ended questions, the respondents were encouraged to express themselves more freely about some aspects of T & D and organizational performance.

The questionnaire used a 5-point Likert rating scale to secure the degree of the presence or prevalence of the variables of interest in the study population as well as a level of importance or agreement (1-5) based on their experience with T & D and organizational performance. The final question sought comments and suggestions for improvement of T & D.

Given that some of the employees of the target population were not conversant with English language, the researcher

developed the Kiswahili version (Dodoso) of questionnaire after pilot-pre-testing. However, the responses were translated back into English prior to data analysis.

The researcher decided to use questionnaires as the major data collection instrument in this study because they are cheap and participants felt free to use questionnaires, they had standardized answers and hence made it easier to compile the data; they guarantee respondent's anonymity and they avoid interviewers bias (Creswell 2014).

The researcher distributed questionnaires personally to each respondent and collected them back within 48 hours to ensure all respondents were answering the questionnaire under about the same conditions.

(ii) In-depth Interview

The second primary data collection method the researcher used was personal in-depth interviews. That is, the study also adopted qualitative research method using semi-structured in-depth interviews with few selected managerial and non-managerial employees from NBC bank branch. The guiding questions were prepared basing on each research objective/question prepared in advance as indicated in the interview guide.

Pre-testing Pilot Study

The researcher planned to use several primary data collection methods in order to collect data from different sources. However, to obtain valid and reliable data, a pre-testing pilot study of data collection methods was conducted with employees at the target NBC bank branches in Mwanza city. Both questionnaire and interview guide were tested for their clarity, completeness and appropriateness to the research problem (Bryman and Bell, 2011). The participants' comments, concerns encountered in answering questions and suggestions they made regarding different areas of data collection methods were noted and where appropriate incorporated into the final versions of these research instruments.

However, with interview guide further refining of the research instruments was made during field data collection period whenever it was deemed necessary due to divergence of different opinions from interview. As a result of the pilot study, the researcher ensured that the appropriate and final research instruments were administered with participants who have not been involved in the pilot study and met the criteria of validity and reliability (Creswell 2014).

Data Analysis

Cooper and Schindler (2000) described data analysis as the process of editing and reducing accumulated data to a manageable size, developing summaries, seeking for patterns and using statistical methods. [Data analysis is defined as a critical examination of the assembled and grouped data for studying the characteristics of the object under study and for determining the patterns of the relationships among the variables relating to the study topic (Manyilizu, 2008)]. According to Kothari (2008, p. 122), the data after being collected must be processed and analyzed in accordance with the outlines laid down at the time of developing the research plan. This study obtained its primary data in form of quantitative data through questionnaires with respondent's as well qualitative data through in-depth personal

interviews with selected interviewees. Each type of data requires a different method of analysis.

For quantitative data obtained from questionnaires with NBC bank employees (management and non-managerial employees), they were first edited and debugged, coded, entered into Statistical Package for Social Science (SPSS) prior to analysis (Pallant, 2005). The data was then analysed using descriptive statistics and output was presented as frequency distribution tables, and pie chart and percentages. In contrast, for the qualitative data obtained from in-depth interview in form of written notes and scripts with selected employees, were analyzed by identification and categorization of text information in themes, patterns and meanings. These outputs were then linked to the relevant research objectives to generate better meaning and explanation about impact of T & D on organizational performance at NBC bank in Mwanza City.

Reliability and Validity of Research Design

Patton (2001) states that validity and reliability are two factors which any researcher should be concerned about while designing analyzing and judging the quality of the study. Furthermore, Easwaran and Singh (2010, pp.214-217) indicate that there are two criteria used to judge the quality of research design and empirical research; and these are reliability and validity.

(i) Reliability

Reliability refers to the consistency with which repeated measures produce the same result across time and across observers (Patton, 2002). Moreover, Edwards and Talbot (1994) assert that reliability requires that the measures or data collection methods should not be influenced by changes in context. To ensure reliability of the data, all the questionnaires used in the research were uniform in terms of layout and number of questions to all respondents. In addition, the reliability of the questionnaires was achieved through pre-testing pilot study with respondents in the target study areas NBC bank branches in Mwanza city and ensured that, respondents understood the questions in the same way. Adding to that, all the data collected for the research were uniformly processed to ensure consistency and stability of the research results and conclusions drawn from the study could be reproduced if the research would be conducted again using other researchers with similar data collection instruments.

(ii) Validity

Validity is defined as the degree to which a study accurately reflects or assesses the specific concept that the researcher is attempting to measure (Neumann 2003, p.123). Thus, the researcher ought to be concerned with external, internal and construct validity.

External validity relates to the generalizability of research findings from survey research to entire population (Thomas & Nelson 2001, p.30). Since this research is not a statistical study and the aim was to sample widely, external validity was attained by analytical generalization whereby the researcher compared research evidence from previous studies on the same topic.

Internal validity refers to the extent to which the differences that is found for the dependent variables directly relate to the independent variables (Mackey and Gass 2005). In this present study, internal validity was attained through specifying the units

of analysis and developing the conceptual framework that depicted the relationship between variables as indicated in figure 1.1

Construct validity: According to Mackey (2005), construct validity is a degree to which the research instrument adequately captures the construct of the interest. To ensure construct validity, the researcher took several measures. Firstly, the conceptual framework was based on the constructs/practices identified in the empirical literature reviewed in this study. Secondly, the evidence from the phenomenon under study (T & D and organizational performance) were gathered from multiple sources (questionnaires, in-depth interviews) for data triangulation.

IV. DATA PRESENTATION, ANALYSIS AND DISCUSSION

Background of Respondents

(a) Response Rate

In this study 92 questionnaires were distributed to employees at the three NBC bank branches in Mwanza City and a total of 75 questionnaire were returned complete and usable for data analysis. This represents a response rate of 85.9%. As noted by Mugenda and Mugenda (2003), a minimum response rate for good empirical research should be at least 60%. So this research response rate far exceeded the recommended minimum, and therefore the researcher collected sufficient data for the study and hence allowed valid data analysis.

(b) Background of Respondents

(i) Respondents' Gender

Table 4.1 Respondents' gender

Gender	Frequency	Percent
Male	35	46.7
Female	40	53.3
Total	75	100.0

Source: Field data (2019)

Table 4.1 shows that 46.7% of the respondents were male and 53.3% female. This is fairly representative as these days more women are the majority of employees in the banking industry in Tanzania.

(ii) Respondents' Age

Table 4.2 Respondents' Age

Age	Frequency	Percent
22 - 25 years	4	5.3
26 - 35 years	36	48.0
36 - 45 years	25	33.3
>45 years	10	13.3
Total	75	100.0

Source: Field data (2019)

Table 4.2 indicates that 5.3% of the respondents (employees) were 22-25 years of age, 48% 26-35 years, 33.3% were 36-45 years and 13.3% are over 45 years. These results imply that the majority (53.3%) of the employees at NBC bank are youth followed by middle aged group (33.3%) and only small percentage are in senior age. Hence it would be expected that when trained in new skills and knowledge, this young group of workers could be able to improve organizational performance.

(iii) Education Level of Respondents

Table 4.3 Respondents' Education Level

Education level	Frequency	Percent
Secondary/high school	6	8.0
Diploma	11	14.7
Bachelor degree	44	58.7
Post graduate	11	14.7
Post graduate qualification	3	4.0
Total	75	100.0

Source: Field data (2019)

Table 4.3 depicts that the majority (80.4%) of the respondents (employees) at NBC bank have at least a bachelor degree, 14.7% have diploma and 8.0% are secondary/high school level. These results suggest that NBC bank is run by well-educated employees and hence it is expected that their level of performance would increase following training and development programs.

(iv) Respondents' Position Title

(a) Non-managerial Employees

Table 4.4 Employee's Title/position at NBC

Title/Position	Frequency	Percent
Teller	25	33.3
Operations Officer	8	10.7
Customer service officer	26	34.7
Loan officer	12	16.0
Relationship officer	4	5.3
Total	75	100.0

Source: Field data (2019)

Table 4.4 illustrates that 33.3% of non-managerial employees are classified as tellers, 10.7% as operations officer, 34.7% as customer service officer, 16.0% as loan officer and 5.3% as relationship officers. The results suggest that the majority (69.3%) employees at NBC bank are in service delivery role and small percentage are in surveillance role (30.7%).

(b) Management

Table 4.5 is indicative that 60.0% of the respondents were section managers, 20.0% was supervisor and 20% was bank branch manager. The results suggest that organizational structure at NBC bank branches is flat with more persons in service delivery and few in supervisory role. The results indicate that the ratio of manager to non-managerial employees is 1.15 further implying that these bank employees if were trained, they would not need many supervisors.

Table 4.5 Management Position/Title at NBC Bank

Position	Frequency	Percent
Section manager	3	60.0
Supervisor	1	20.0
Branch manager	1	20.0
Total	5	100.0

Source: Field data (2019)

(vi) Duration of Employees at NBC bank
(a) Non- managerial Employees

Table 4.6 Period with NBC bank

Period with NBC bank	Frequency	Percent
<1 year	8	10.7
3 - 5 years	28	37.3
> 5 years	39	52.0
Total	75	100.0

Source: Field data (2019)

Table 4.6 shows that 10.7% of the respondents (employees) at the time of the study had been with NBC bank for less than a year, 37.3% for 3-5 years, and 52.0% for over five years. These results suggest the majority (52.0%) of the non-managerial employees at NBC bank are reasonably well experienced in their roles and so would be their performance at their jobs.

(b) Managerial Employees

Table 4.7 shows that 20% of the respondents have been with NBC bank for 4-6 years and 80% for over 6 years. These results suggest that for employees to be in a management position at NBC bank, they should have worked with the bank for at least 4 years and those who are appointed to the level of branch manager should have been with NBC bank for a minimum of 6 years.

Table 4.7 Duration on the Position

Duration/period with NBC bank	Frequency	Percent
4 - 6 years	1	20.0
> 6 years	4	80.0

Total	5	100.0
-------	---	-------

Source: Field data (2019)

Research Objectives

The study had four research objectives. Next is a discussion of the study results based on each objective.

Research Objective 1: To identify how training needs assessment is conducted at NBC bank in Mwanza City

(i) Training Needs Assessment (TNA)

Table 4.8 shows different aspects of training needs assessment (TNA). In row (i), Table 4.8 shows that 98.7% of the respondents (employees) agreed /strongly agreed that training is compulsory at NBC bank and 1.3% were neutral to that statement.

Table 4.8 Training Needs Assessment

Statement	Strongly agree		Agree		Unsure		Disagree		Strongly disagree	
	Count	%	Count	%	Count	%	Count	%	Count	%
	Training is compulsory for employee	62	82.7	12	16.0	1	1.3	0	0.0	0
I have attended a training	26	34.7	41	54.7	3	4.0	5	6.7	0	0.0
My training needs are determined through AAP	17	22.7	26	34.7	16	21.3	15	20.0	1	1.3
Training needs are directly related to objectives	44	58.7	30	40.0	0	0.0	0	0.0	1	1.3
Basic skills/capabilities are identified during TNA	19	25.3	26	34.7	16	21.3	13	17.3	1	1.3
TNA are determined by management	35	46.7	33	44.0	0	0.0	6	8.0	1	1.3
TN are identified by the employee concerned	10	13.3	37	49.3	8	10.7	18	24.0	2	2.7
TN are identified by the immediate supervisor	9	12.0	38	50.7	13	17.3	13	17.3	2	2.7
TN are conducted by immediate supervisor	11	14.7	36	48.0	7	9.3	18	24.0	3	4.0

Source: Field data (2019)

In row (i), Table 4.8 shows that 98.7% of the respondents (employees) had said that it is compulsory for an employee and 1.3% were not sure. In row (ii), Table 4.8 shows that 89.4% of the respondents (employees) had attended training and development programs; 6.7% had not and 4.0% were not sure. The results suggest that the majority of the employees have attended training organized by NBC bank.

In row (iii), Table 4.8 shows 80% of the respondents (employees) agreed/strongly agreed that TNA is determined through performance appraisal, 20.0% disagreed with that statement and 21.3% were neutral. In row (v), Table 4.8 shows that 98.7% of the respondents (employees) agreed/strongly agreed that training at NBC bank is directly related to the organizational goals.

In row (iv), Table 4.8 shows that 60% of the respondents (employees) agreed/strongly agreed that basic skills/ capabilities that employees should be trained in are identified through TNA, 19% disagreed/ strongly disagreed with that statement and 21.3% were neutral. In row (vi), Table 4.8 shows that 90.7% of the respondents (employees) agreed/strongly agreed that TNA is determined by management, 9.3% disagreed /strongly disagreed with that statement.

In row (vii), Table 4.8 shows that 62.7% of the respondents (employees) agreed /strongly agreed that TNA is identified by immediate supervisors 20% disagreed /strongly disagreed with that statement and 17.3% were neutral.

In row (viii), Table 4.8 shows that 62.6% of the respondents (employees) agreed/ strongly agreed that TNA is identified by employees concerned, 26.7% disagreed/strongly disagreed with that statement and 10.7% were neutral.

In row (ix), Table 4.8 shows that 62.7% of the respondents (employees) agreed/strongly agreed that TNA is conducted by

immediate supervisor while 28.0% disagreed/strongly disagreed with that statement and 9.3% neutral.

These results in Table 4.8 suggest that NBC bank conducts TNA prior to designing and running training and development programs and that TNA is conducted by employees' supervisors, mostly those in top management positions at the bank branch. So NBC bank is following best practices of having TNA as a basic requirement prior to conducting any training and development programs. Hence it can be argued that training and development programs at NBC bank are tailored towards improving skills, knowledge and capabilities of its employees that are identified through TNA. This is similar to the findings from Mwaibako (2013) that indicated if there is no existence of training needs assessment we expect to have unsystematic and unplanned training of employees.

Research Objective 2: To determine the training and development (T & D) policies, practices and procedures at NBC bank in Mwanza City.

(a) Employees Perspective

Table 4.9 shows different aspects of T&D policies and procedures at NBC employees according to employees' experiences.

In this section the researcher's intention was to identify the training and development policies, practices and procedures that are carried out at NBC bank in Mwanza city, therefore the following were noted from data collected:-

In row (i), Table 4.9 shows that 1.3% of the respondents (employees) strongly disagreed that NBC bank has T&D policies and procedures while 86.7% agreed/strongly agreed with that statement and 4.0% were neutral.

Table 4.9 T & D policies and procedures at NBC bank

Statement	Strongly agree		Agree		Unsure		Disagree		Strongly disagree	
	Count	%	Count t	%	Count t	%	Count t	%	Count t	%
Bank has T&D policies and procedures	50	66.7	21	28.0	3	4.0	0	0.0	1	1.3
T&D policy document is available to staff members	45	60.0	14	18.7	9	12.0	4	5.3	3	4.0
Provisions in T&D policy document to rise up in rank	14	18.7	34	45.3	22	29.3	3	4.0	2	2.7
T in NBC is planned and is systematic	35	46.7	29	38.7	8	10.7	1	1.3	2	2.7

T organised by the NBC is motivational to employees	35	46.7	30	40.0	6	8.0	3	4.0	1	1.3
Every staff member at NBC has opportunity to be trained	40	53.3	25	33.3	7	9.3	2	2.7	1	1.3
I have been sponsored for further studies	1	1.3	5	6.7	5	6.7	35	46.7	29	38.7
I have sponsored myself for further studies	5	6.7	21	28.0	7	9.3	35	46.7	7	9.3
NBC grants study leave to staff to develop themselves	38	50.7	18	24.0	14	18.7	4	5.3	1	1.3
I have been sponsored by NBC to attend training	1	1.3	4	5.3	3	4.0	32	42.7	35	46.7

Source: Field data (2019)

In row (ii), Table 4.9 shows that 78.7% of the respondents (employees) agreed/strongly agreed that T&D policy document at NBC bank is available to staff members while 9.3% disagreed/strongly disagreed with that statement, and 12.0% were neutral.

In row (iii), Table 4.9 shows that 64% of the respondents (employees) agreed/strongly agreed that the provision in the T&D policy document rise up to employees' expectations, 6.7% disagreed/strongly disagreed with that statement and 29.3% were neutral.

In row (iv), Table 4.9 shows that 85.4% of the respondents (employees) agreed/strongly agreed that T&D at NBC bank is planned and systematic, 4.0% disagreed/strongly disagreed with that statement, and 10.7% were neutral.

In row (v), Table 4.9 shows that 86.7% of the respondents (employees) agreed/strongly agreed that T&D programs organized by NBC bank is motivational to employees, 5.3% disagreed/strongly disagreed with that statement and 8.0% were neutral.

In row (vi), Table 4.9 shows that 86.6% of the respondents (employees) agreed/strongly agreed that every staff members at NBC bank has had an opportunity to be trained while 4.0% disagreed /strongly disagreed with that statement and 9.3% were neutral.

In row (vii) Table 4.9 indicates that 8.0% of the respondents (employees) agreed/strongly agreed that they had been sponsored by the bank for further studies, while 85.4% disagreed/strongly disagreed, and 18.7% were neutral. These results suggest NBC

bank may not be ready to sponsor workers for long term training and development opportunities.

In row (viii) Table 4.9 shows that 34.7% of the respondents (employees) agreed/strongly agreed that they have sponsored themselves for further studies, while 57% disagreed/strongly disagreed with that statement and 9.3% were neutral.

In row (ix) Table 4.9 shows that 74.0% of the respondents (employees) agreed/strongly agreed that NBC grants study leave to its staff to develop themselves, 8.0% disagreed/strongly disagreed with that statement and 18.7% were neutral.

In row (x) Table 4.9 shows that 6.6% of the respondents (employees) agreed/strongly agreed that they have been sponsored by NBC bank to attend other non-bank training, while 87.4% disagreed/strongly disagreed with that statement and 4.0% were neutral.

These results in Table 4.9 suggest NBC bank has a T&D policy and that T&D policy is available to employees; T&D at NBC bank is planned and systematic, and offers motivation to employees. However, the results suggest that NBC bank does not sponsor its employees for further studies but the bank grants workers study leave to attend their self-sponsored studies. The results also mean that NBC bank pays for employees to go for short term training and development programs that are relevant to employees' job and organizational goals. A similarity was identified from a study conducted by Liang (2009) and it was vivid that training and development is an effective tool for both personal and organizational success and on the other hand it was obvious that if training practices were not line we don't expect to have a systematic and planned training and development process.

(b) Management Perspective

Table 4.10 T & D policies and procedures at NBC bank – Management perspective

Statement	Agree		Strongly agree	
	Count	%	Count	%
There is T & D Policy	3	60.0	2	40.0
T & D policy at bank is strictly adhered	3	60.0	2	40.0
All employees are given opportunity for T & D activities	3	60.0	2	40.0
T needs are identified through formal process	3	60.0	2	40.0
Training needs based on employee's and organizational needs	4	80.0	1	20.0
Training is planned and systematic	4	80.0	1	20.0
The bank links T & D to its business strategy	2	40.0	3	60.0

Source: Field data (2019)

Table 4.10 shows that 100% of the respondents (management) agreed/strongly agreed that there is a T&D policy; T &D policy is strictly adhered to, all employees are given opportunity for T&D, training needs are identified through a formal process and T & D programs are based on employees and organizational needs. Also, all the management agreed/strongly agreed that training at NBC bank is planned and systematic and the bank links the T&D to its business strategy.

Both Tables 4.9 and 4.10 suggest that overall, both employees and management agreed that T & D policy exists, employees are given opportunity for T & D; T & D programs are planned and systematic and they are also linked to NBC bank business strategy. With that, one would expect T & D, when given to employers, should improve the skills and knowledge of employees which should be manifested in improved job performance and overall organizational performance.

Research Objective 3: To determine the training and development methods used on employees at NBC bank in Mwanza City.

(i) Employees' attended of T & D Programs

Table 4.11 shows that all non-managerial employees have attended at least two T & D programs each year.

Table 4.11 Have you attended any T&D program sponsored by NBC

Response	Frequency	Percent
Yes	75	100.0

Source: Field data (2019)

(ii) On-the-Job Training Methods

Table 4.12 On-the-Job Training Methods

On-the-job training methods	Yes	
	Frequency	%
Mentoring & coaching were used for facilitation	59	19.4
Job rotation was used for facilitation	53	17.4
Under study training was used for facilitation	32	10.5
Conference/Group discussion was used	61	20.1
Lecture was used for facilitation	64	21.1
Role play was used for facilitation	31	10.2
Other methods was used for facilitation	4	1.3
Total	304	100.0

Source: Field data (2019)

(iii) Ranking in order of importance of on job training methods on effectiveness

Table 4.13 Ranking of on-the-job training methods in terms of effectiveness

Ranking of on-the-job training methods	Most effective		Second most effective		Third most effective		Fourth most effective		Fifth most effective		Least effective	
	Count	%	Count	%	Count	%	Count	%	Count	%	Count	%
Ranking of mentoring/Coaching method	23	30.7	29	38.7	10	13.3	8	10.7	4	5.3	1	1.3

Ranking of job rotation method	30	40.0	21	28.0	12	16.0	9	12.0	3	4.0	0	0.0
Ranking of Under study training method	1	1.3	2	2.7	8	10.7	11	14.7	33	44.0	20	26.7
Ranking of Conference/Group discussion method	2	2.7	12	16.0	28	37.3	21	28.0	10	13.3	2	2.7
Ranking of lecture method	8	10.7	5	6.7	16	21.3	24	32.0	16	21.3	6	8.0
Ranking of role play method	9	12.0	8	10.7	1	1.3	2	2.7	9	12.0	46	61.3

Source: Field data (2019)

Table 4.13 shows that respondents (employees) ranked job rotation as the most effective method of training (84.0%), followed by mentoring and coaching (83.7%) and group discussion (56.0%). These results suggest that the management of NBC bank should spend most time designing and running T & D programs for its employees, which involve job rotation, and mentoring and coaching because with these methods, employees learn by doing their tasks on the job.

(iv) Effectiveness of Training Methods used at NBC bank

Table 4.14 Effectiveness of training methods used at NBC bank

Method	Most	Effective	Unsure	Ineffective	Most
Mentoring/Coaching	effective (68.1%)	15 (20.%)	7 (9.3%)	2 (2.7%)	ineffective (0.0%)
Job rotation	54 (72.0%)	12 (16.0%)	5 (6.7%)	3 (4.0%)	1 (1.5%)
Group discussion	32 (42.7%)	20 (26.7%)	7 (9.3%)	12 (16.4%)	4 (5.3%)
Lecture	20 (26.7%)	17 (22.7%)	17 (27.7%)	12 (16.0%)	9 (12.0%)
Understudy	8 (10.7%)	7 (9.3%)	9 (12.0%)	15 (20.0%)	36 (48.0%)
Role Play	12 (16.0%)	16 (21.3%)	9 (12.0%)	15 (20.0%)	23 (50.7%)

Source: Field data (2019)

Table 4.14 shows how respondents viewed training methods used by NBC bank in terms of their effectiveness in equipping them with skills and knowledge they required for performing their tasks at work.

In row (i), Table 4.14 shows that 68% of the respondents found mentoring/coaching most effective, 20.5% found it effective, 2.7% ineffective and 9.3% were unsure.

In row (ii), Table 4.14 shows that 72% of the respondents found job rotation most effective, 16.0% found it effective, 5.5% ineffective and 6.7% were unsure.

In row (iii), Table 4.14 shows that 42% of the respondents found group discussion most effective, 26.7% found it effective, 2.7% ineffective and 9.3% were unsure.

In row (iv), Table 4.14 shows that 26% of the respondents found lectures most effective,

22.7% found them effective, 26.0% ineffective and 27.7% were unsure.

In row (v), Table 4.14 shows that 10.7% of the respondents found understudy most effective, 9.3% found it effective, 68% ineffective and 12.0% were unsure.

In row (vi), Table 4.14 shows that 16% of the respondents found role play most effective, 21.1% found it effective, 70.7% ineffective and 12.0% were unsure.

These results in Table 4.14 (rows i to vi) further suggest that job rotation is the most effective method of on-the-job training method followed by mentoring/coaching and then group

discussion. Other training methods are not that effective. The results agree with those results in Table 4.13

(iv) Effect of T & D on Improving Employees' Skills and Knowledge

Table 4.15 shows that 81.3% of the respondents (employees) said "Yes" that T & D programs have improved their skills and knowledge to do their jobs, and 18.7% were of the view that T & D programs did improve their skills and knowledge to some extent.

Overall, T & D programs have improved skills and knowledge of most employees (81.3%) at NBC bank in Mwanza city.

Table 4.15 Training has improved skills and capabilities

Response	Frequency	Percent
Definitely Yes	61	81.3
Yes but to some extent	14	18.7
Total	75	100.0

Source: Field data (2019)

(v) Employees' Satisfaction with T & D Methods

Table 4.16 Satisfaction with training methods used by NBC bank

Response	Frequency	Percent
Yes	27	36.0
No	48	64.0
Total	75	100.0

Source: Field data (2019)

Table 4.16 indicates that only 36.0% of the employees were completely satisfied with training methods used by NBC bank while the majority (64.0%) were not satisfied. These results suggest, the mostly used methods on T & D programs by NBC bank need to be reviewed and evaluated to improve their effectiveness. One interviewee commented.

"Sometimes we are given these groups discussion and lecture type of training, but most of the time they are not relevant to our specific job activities. They are wastage of time we need more on task related training and job rotation type of training multi skill and break the boredom of being in one job for long time" (Interview 4).

This comment demonstrates that job rotation and job mentoring and coaching are not commonly used at NBC bank although they have been ranked as the most effective methods for T & D programs (Tables 4.13 and 4.14).

Research Objective 4: To determine the effect of training and development programs toward employee and organizational performance at NBC bank in Mwanza City

(i) Effect of T & D Programs on Employees Performance (employees perspective)

Table 4.17 Effect of T & D programs on employees’ performance (employee perspective)

Statement	Strongly disagree		Disagree		Neutral		Agree		Strongly agree	
	Count	%	Count	%	Count	%	Count	%	Count	%
T&D sessions of NBC helped me acquire new skills	4	5.3	0	0.0	2	2.7	33	44.0	36	48.0
T&D helped me perform my tasks efficiently & effectively	2	2.7	0	0.0	2	2.7	35	46.7	36	48.0
T&D helped me serve customers better and faster	2	2.7	0	0.0	4	5.3	33	44.0	36	48.0
Training motivates workers to work hard	2	2.7	2	2.7	7	9.3	33	44.0	31	41.3
T&D increase job satisfaction and morale	3	4.0	1	1.3	5	6.7	35	46.7	31	41.3
T&D improves effective management of complaints	3	4.0	0	0.0	5	6.7	35	46.7	32	42.7
T&D have helped me work well	2	2.7	1	1.3	3	4.0	39	52.0	30	40.0
When I arrive from training I am encouraged to share my experience	2	2.7	1	1.3	3	4.0	34	45.3	35	46.7

Source: Field data (2019)

Table 4.17 shows the effect of T & D programs on employees’ performance from employees’ perspective. That is, self-evaluation by employees according to their experience.

In row (i), Table 4.17 shows that 92.7% of the respondents (employees) agreed/strongly agreed that T & D programs have helped them to acquire new skills while 5.3% strongly disagreed with that statement and 2.7% were neutral.

In row (ii), Table 4.17 indicates that 94.7% of the respondents (employees) agreed/strongly agreed that T & D programs have helped them perform their tasks effectively and efficiently, while 2.7%, strongly disagreed with that statement and 2.7% were neutral.

In row (iii), Table 4.17 shows that 92.0% of the respondents (employees) agreed/strongly agreed that T & D programs has helped them to serve customers better and faster, while

2.7% strongly disagreed with that statement and 5.3% were neutral.

In row (iv), Table 4.17 shows that 85.3% of the respondents (employees) agreed/strongly agreed that T & D programs motivates them to work harder at their jobs while 5.4% disagreed/strongly disagreed with that statement and 9.3% were neutral.

In row (v), Table 4.17 shows that 88.0% of the respondents (employees) agreed/strongly agreed that T & D programs increase job satisfaction and morale, 5.3% disagreed /strongly disagreed with that statement and 6.7% were neutral.

In row (vi), Table 4.17 shows that 87.4% of the respondents (employees) agreed/strongly agreed that T & D programs improve their ability to manage customers complaints, 4.0% strongly disagreed with that statement and 6.7% were neutral.

In row (vii), Table 4.17 shows that 92% of the respondents (employees) agreed/strongly agreed that T & D programs have helped them to work well at their jobs, while 4.0% disagreed /strongly disagreed with that statement and 4.0% were neutral.

In row (viii), Table 4.17 shows that 92.0% of the respondents (employees) agreed/strongly agreed that T & D programs encouraged them to share their experience with fellow workers and gives some kind of excitement at work, while 4.0% disagreed /strongly disagreed with that statement and 4.0 % were neutral.

These results in Table 4.17 suggest that T & D programs have a positive and significant effect on employees’ performances. These results agree with previous studies by Oghomhe et al (2016) in their Nigerian study, that T & D programs offered to bank staff resulted in efficient performance of their functions. The results further concur with research by Athar and Shah (2015) in their study of banks in Karachi (Pakistan) that T & D programs motivate employees, and that motivation had a strong positive relationship with employees’ performance.

Thus, T & D programs of every organization such as commercial banks are designed to improve employees’ skills and knowledge that lead to improved job performance. This observation was equally summed by a comment from one employee.

“I enjoy going for training because /go there to learn things that will help me to perform my job better than before. Most importantly after that training I am motivated to put into practice what I have learnt for example providing better customer service and time management. This in long-run also improves organizational reputation and overall performance which is the ultimate goal of employee training” (Respondents 17).

These comments further confirms that T & D programs should part and parcel of organization strategic plan for human resource is the engine and drivers of organization performance.

(ii) Effect of T & D programs on employees’ performance (management perspective)

Table 4.18 Effect of T & D programs on employees’ performance (management perspective)

Statement	Neutral		Agree		Strongly agree	
	Count	%	Count	%	Count	%
T & D motivates employees to work hard	0	0.0	5	100.0	0	0.0
T & D increases efficiency and quality of work output	0	0.0	3	60.0	2	40.0
T & D increases job satisfaction and morale	0	0.0	5	100.0	0	0.0
T & D promote working relationship	1	20.0	2	40.0	2	40.0
T & D contributes to improvement of staff skills	0	0.0	4	80.0	1	20.0
Training leads to a better understanding of bank mandate	0	0.0	3	60.0	2	40.0
Overall, T & D has positive influence on performance	0	0.0	3	60.0	2	40.0

Source: Field data (2019)

Table 4.18 shows the effect of T & D programs on employees’ performance from management perspective.

In rows (i), (ii), (iii), (iv), (v), (vi), and (vii), table 4.18 shows that 100.0% of the management agreed/strongly agreed that T & D programs motivate employees to work harder, increases their efficiency at work and quality work output, increase job satisfaction and work morale, contribute to improvement of skills, lead to better understanding of bank mandate and overall it influences work performance.

However, in row (iv), Table 4.18 shows that 80.0% of the management agreed/strongly agreed that T & D programs promote strong working relationship and 20% were neutral with that statement. This implies that this area concerning building a working relationship between workers, needs some improvement since working relationship is an essential part of the bank activities as each section of the bank has some bearing on another section.

Overall, the results of both Tables 4.17 and 4.18 suggest that both employees and management agree that T & D programs have a positive impact on staff performance. This recognition is vital as

both groups see this HR activity as an important part of internal marketing, which is about developing people (staff) to deliver service quality.

One manager commented:

“We take T & D programs of our staff seriously because if these workers are not skilled and have adequate knowledge of our product, it is difficult to deliver superior service to our clients. The employees are the bank so to speak. They need to be trained on technical and interactive skills which empowers them and this helps to promote teamwork in the bank”

This comment drives the point home that T & D programs are dispensable activity of an organization especially in a competitive industry such as that of banking. This importance was also emphasized and demonstrated by a recent study by Afrox (2018) in Bangladesh banking industry that there is a strong relationship between employees training and employees’

performance. It further illustrated that the more the employee gets training, the more efficient their level of performance will be.

(ii) Effect of T & D Programs on Organizational Performance

Table 4.19 shows that the effects of T & D programs on organization performance. In particular in rows (i), (iii), (iv) all the respondents (management) unanimously agree/strongly agreed that T & D programs have a strong influence on employees’ performance, strong influence on customer satisfaction and strong influence on quality of service delivery all of which are the indicators of organizational performance. These results agree with previous studies by Ng’ang’a et al (2013) in their Kenyan study of commercial banks which established that there is a positive correlation between T & D programs and organizational performance.

Table 4.19 Effect of T & D Programs on Organizational Performance

Statement	Neutral		Agree		Strongly agree	
	Count	%	Count	%	Count	%
T & D programs have strong influence on employees’ performance	0	0.0	4	80.0	1	20.0
T & D programs have strong influence on organizational performance	1	20.0	3	60.0	1	20.0
T & D programs have strong influence on customer satisfaction	0	0.0	4	80.0	1	20.0
T & D programs have strong influence on quality of service delivery	0	0.0	2	40.0	3	60.0

Source: Field data (2019)

In row (ii) Table 4.19 shows that 80% of the respondents (management) agreed /strongly agreed that T & D programs have a strong influence on organizational performance while 20% were neutral to that statement. These results suggest that there are other factors such as motivation, customer service and use of modern technologies besides T & D programs, which contribute to organizational performance. Nevertheless, T & D is one of the major contributors to organizational performance.

Other Issues Raised in the study

Several extra issues were raised by employees during the interview. Some employees commented that the e-training which was implemented at NBC bank was not well understood and would have preferred to do off job training for new technology related training.

Other employees were concerned that most of the T & D programs offered at NBC bank are not planned according to the market requirements. That is, some training programs offered by

NBC bank were not relevant to employees’ job requirements. Even some members of the management concurred with this employees’ observation. Some also suggested that NBC bank should increase the time that employees are on training as most of the information in the current training programs are rushed through during training and employees do not have time to digest the material which is contrary to best practices in employees’ training programs. However, the management thought their T&D system is very systematic and aligned well with achievement of the organizational goals.

Besides, some employees and management suggested that even their customers ought to be trained especially with the self-service technology such as e-banking and mobile phone banking. Doing so would minimize the number of customers’ complaints and save desk service time.

The employees as well as management further indicated that motivation should be attached to training programs because it is part and parcel of other factors that go hand-in-hand with

enhancing employees' performance. At the moment that linkage is absent in NBC bank training programs. The management further suggested that future TNA should also look at technical analysis as it appears to be over looked in the current training programs. Overall, both employees and management emphasized that T & D programs offered by NBC bank should be geared towards meeting the needs of their customers, which is the central piece for the long-term existence of the bank.

V. SUMMARY, CONCLUSION AND RECOMMENDATIONS

Summary of Findings

Research Objective 1: To identify how Training Needs Assessment is conducted at

NBC bank in Mwanza City

NBC bank has over the past year has been involved in T & D activities for its employees. The data collected from questionnaires and some interviews indicate that every employee at NBC bank is given an opportunity to go for training and TNA is done prior to designing and running T & D programs. The purpose of the training and development programs are to equip employees with new skills and capabilities identified in TNA for different workers in each department; most of the TNA at NBC bank is done by employees' supervisors, and during the annual appraisal process. The research findings also reveal that employees' training needs are related to the organizational goals and are part of the bank mandate.

Research Objective 2: To determine the Training and Development (T & D) policies, practices and procedures at NBC bank in Mwanza City.

The study reveals that NBC bank has T & D policies and procedures which are also available to staff. In those policies, there is a provision that T & D programs should allow workers to rise through ranks of NBC bank. The research has also found that T & D programs are considered by the majority of employees to be planned and systematic. The management also concurred with the views expressed by employees on T & D policy and taking T & D as part of NBC bank business strategy. However, their T & D programs do not sponsor their staff for further studies although the bank grants workers leave to do examinations in their privately sponsored studies.

Research Objective 3: To determine the Training and Development Methods used on Employees at NBC bank in Mwanza City.

The study indicates that every employee surveyed in this research has attended T & D programs sponsored by NBC bank. The employees indicated that although they were trained on-job training with different methods, they preferred mentoring and coaching and job rotation because they benefited most in terms of acquiring skills and knowledge to effectively and efficiently perform their specific daily tasks. Overall, employees indicated that T & D programs have improved their skills and capabilities. However, they expressed dissatisfaction with some training methods such as group discussion classroom type and role play type of training because most of the activities did not relate directly to their work situation

Research Objective 4: To determine the effect of Training and Development

Programs toward Employee and Organizational Performance at NBC bank in Mwanza. City

The research findings reveal that T & D programs sponsored by NBC bank have helped employees to acquire new skills, improved their ability to serve customers better and faster, motivated employees, and has generally improved workers' morale and job satisfaction, all being indicators of employees' performance. These findings are broadly in consistence with prior HR literature on training and development. Furthermore, the results of this study reveal that T & D programs have a strong influence on employees' performance, customer satisfaction and quality of service delivery. The study also establishes that T & D programs have a strong influence on overall organizational performance but also notes that T & D programs are one of the factors contributing to organizational performance. Other factors such as employees' motivation, use of modern technologies and marketing also contribute to the organizational performance.

Clearly the overwhelming majority of management (over 80%) do believe that T & D programs have a positive and significant effect on both employees' performance and overall organizational performance. The study further establishes that T & D programs are relevant and consistent with the organizational business strategy or policy setting and it is compulsory practice on training. However, it also establishes that the employees are dissatisfied that NBC bank has not offered them opportunity to go for further studies as part of their development and career progression.

Conclusion

The study sought to investigate the effect of employees' training and development practices on organizational performance in Tanzanian banking industry, a case of NBC in Mwanza city.

The findings in this research indicated that NBC does TNA before its T&D programs, uses different methods to train non-managerial employees such as mentoring, lecture style, role play and job rotation such T&D have improved employees' skills and knowledge to perform better at their work. The finding from the study also indicates that NBC bank organizes training programs from time to time for its employees for the purpose of equipping them with and updating their knowledge and skills to ensure high level of efficiency. The employees were generally satisfied with the training methods used. Overall, T & D has positively affected employees' performance and consequently organizational performance. From the results of the study, it can be concluded that NBC bank has a well-established policy that has guided them to invest in training and development of its employees; however, the processes involved are being not duly followed at branch level.

Recommendations

T&D interventions/programs at the NBC bank was found to be effective in impacting its employees with skills and knowledge relevant to their work. However, the influence of T&D on employees' job performance was found to be moderate, indicating that other factors can impact employees' job performance. Therefore, any organization such as NBC bank that wishes to be productive should make T & D part of its strategic business plan.

Training and development is only one of the human resources activities that HR department ought to do to improve organizational performance. Without incorporating other practices such as motivation, its impact may be limited. Therefore, NBC bank HRM department should strategically and methodologically develop human resource bundles packages that are designed to achieve the desired organizational performance.

The study reveals that the NBC did not seem to have training objectives well-articulated to employees according to organization, goals. The HRM department at head office in conjunction with HR at each branch, should clearly state the results of each employee, what change is required in terms of employees' knowledge, skills, attitude and behaviours. The training goals should be specific, tangible verifiable, timely and measurable and such objectives should be made clear to both the branch manager and employees because they can be used to evaluate their success.

It was also noted from interview that NBC bank has a performance system. The performance appraisal information which is used yearly at NBC bank to assess employees' performance should identify their performance problems and ways they can improve their performance through training and development programs.

Motivation seeks to enhance employees' morale to work hard and thus increase organizational productivity. It is with premise that NBC bank should initiate a policy for motivation attached to training programs.

Finally, it is critical that NBC bank should evaluate the T&D programs they offer to their employees in order to assess their effectiveness in producing the specific learning outcomes specified in the training programs and to indicate where improvement or changes are required to make training even more effective.

ABSTRACT:- Cervical cancer is the second most common cancer in women worldwide & is most common cancer causing death in the developing countries.¹ Sexually transmitted human papilloma virus (HPV) infection is the important cause of cervix intraepithelial neoplasia and invasive cervix cancer. Women have little awareness about cervical cancer that contribute significantly for prevalence of disease. Cervical cancer screening using Pap smear provides an appropriate way for early detection & prevention of cervical cancer.

So, Investigator planned to check the Effectiveness of Structured Teaching Programme on Knowledge regarding Prevention and Warning Signs of Cervical Cancer among Women in Selected Areas of Jalandhar, Punjab, 2019.

Aim Of The Study :- To enhance the knowledge regarding prevention and warning signs of cervical cancer among women through structured teaching programme. **Method and material:-** quasi experimental research design was used. The study was conducted on 100 women and was selected through convenient sampling technique, women of above 35 years of age in selected areas of Jalandhar. Data was collected by using socio demographic variables sheet and structured knowledge questionnaire. **Statistical analysis:-** Collected data was analyzed by descriptive and inferential statistics.

Result:- revealed that in experimental group there was significant ($t_{cal} 30.012 > t_{tab} 1.96$ at $p < 0.05$) difference between pretest (12.48 ± 2.150) and posttest (24.80 ± 1.959) knowledge of women. Whereas in control group there was no significant ($t_{cal} 1.426 < t_{tab} 1.96$ at $p < 0.05$) difference between pretest (13.060 ± 1.910) and posttest (13.34 ± 1.858) knowledge of women. There was association of menstrual status of women in experimental group with post test knowledge and whereas in control group association of occupation, qualification and residential area with post test knowledge regarding prevention and warning signs of cervical cancer among women.

Conclusion:- The structured teaching programme was effective in providing knowledge regarding prevention and warning signs of cervical cancer among women in experimental group.

Key Words: Knowledge, Structured Teaching Programme, Prevention, Warning Signs, Cervical Cancer.

INTRODUCTION

“Cancer is only going to be a chapter in your life, not the whole story”.

Human body is made up of cells which are the structural and functional unit of the body.² When abnormal proliferation and mutation occur in normal cell growth then it leads to cancer.³

There are different types of cancers among men and women that affect their health status. Most common cancer among men is: esophageal cancer, stomach cancer, lung cancer, prostate cancer, and urethral cancer. Common cancers among women are breast cancer, ovarian cancer, and most common cancer that is leading to death is cervical cancer.⁴

Cervical cancer begins when healthy cells on the surface of the cervix change and grow out of control, forming a mass called a tumor.⁵ A tumor can be cancerous or benign. A cancerous tumor is malignant, meaning it can spread to other parts of the body. A benign tumor means the tumor will not spread.⁶

Cervical cancer is the commonest cancer cause of death among women in developing countries. Mortality due to cervical cancer is also an indicator of health inequities, as 86% of all deaths due to cervical cancer are in developing, low- and middle-income countries.⁷ Cervical cancer is both preventable and treatable disease. Racial and ethnic minorities and those of low socio-economic status tend to experience the greatest morbidity and mortality due to cervical cancer. Cervical cancer is the cancer that starts in the cervix, the lower part of the uterus that opens at the top of the vagina. It usually develops very slowly. It starts as a precancerous condition called dysplasia. The precancerous condition can be detected by Pap smear and is 100% treatable. The American cancer society estimated that in 2017, approximately 12,820 American women will be diagnosed with cervical cancer and 4,210 will die from the disease. Most instances will be diagnosed in women who are between the age 20 and 50.⁸

Cervical cancer comes next only to breast cancer in terms of mortality rate which is high in Indian women. Cancer of cervix is the third most common cancer with estimated 1 lakh new cases in 2016 and about 1.04 lakh during 2020. Cancers

associated with the use of tobacco account for about 30 percent of all cancers in males and females, the ICMR said.⁹

The two preventive strategies for cervical cancer include screening and vaccination. In India 3.1% get screened, leaving a large population vulnerable to death from the disease.¹⁰ If cervical abnormalities are detected at an early stage the abnormal tissue can be excised using day care and minimally invasive surgical procedures. Regular screening and follow up care can prevent most deaths from cervical cancer. The health care reform act covers cervical cancer screenings, part of a “well-women visit.” Because it usually takes several years for normal cells in the cervix to turn into cells, it’s imperative to get regular screenings, either with a Pap smear test or HPV DNA test. And other diagnostic tests are colposcopy, chest X-ray, CT-scan, MRI and pelvic ultrasound.¹⁰

Almost all cervical cancers are caused by the sexually transmitted human papilloma virus. Human Papilloma Virus is associated with 50,000 new cases of cervical cancer and 250,000 associated cervical cancer deaths worldwide each year.² It also causes vulvar, vaginal, anal, and penile cancers as well as precancerous lesions of vulva/vagina, genital warts, and respiratory papillomatosis. HPV infections are asymptomatic, and generally, individuals are not aware of being infected, thus facilitating the spread easily and unknowingly.¹¹

The human papilloma virus (HPV), which spreads through sexual contact, causes cervical cancer. Most women's bodies can fight the HPV infection before it leads to cancer. At least 50% of men and women acquire genital HPV infection during their lifetime. All sexually active women are infected with HPV at least once during their lifetime, and the highest prevalence is seen soon after the onset of sexual activities.¹²

There are two types of HPV, 16 and 18 accounting for approximately 60 to 70% of cervical cancer cases. HPV are higher among adolescents, young adults and population with low-economic status. More common risk factors for cervical cancer are having sex at an early age, multiple sexual partners,

and poor socio-economic status, smoking, weakened immune system, several pregnancies, long term use of the contraceptive pills, family history.¹²

Cervical cancer may spread within the pelvis, to the lymph nodes and elsewhere in body. Signs of cervical cancer are weight loss, fatigue, back pain, leg pain, leakage of urine or feces from the vagina, bone fractures and symptoms are: vaginal bleeding, unusual vaginal bleeding and pelvic pain. Cervical cancer is treated with radiation, chemotherapy and also with hysterectomy or partial removal of affected part of uterus and cervix.¹³

Cervical cancer is prevented by maintaining good personal hygiene, Avoiding smoking and alcohol consumption, avoidance of multiple sexual relationships, by giving knowledge on sex education and use of cervical cancer vaccination before marriage and sexual relationship. A vaccine to prevent cervical cancer is now available. "The United States Food and Drug Administration" approved the vaccine for cervical cancer i.e. Gardasil and cervarix which cost around Rs.10000 for 3 shots, which prevents infection against two types of HPV responsible for most cervical cancer cases.¹⁴

Most of the people were not aware about the warning signs of cervical cancer, which may not cause any symptoms at first (when they are pre-cancers or early cancers), but later on, may affect with pelvic pain or vaginal bleeding. warning signs of cervical cancer are Bleeding after intercourse, Bleeding after menopause, Bleeding between periods, Bleeding after douching, Bleeding following a pelvic examination, Having heavier menstrual periods than usual or ones that last longer than usual, Unusual vaginal discharge, Pain during sex, Pelvic pain.¹⁵

Singh V, Sehgal A et-al (2012) An exploratory study was conducted among public aged between 25-54 years of age to explore the knowledge, attitudes and behaviors of people regarding warning signs of cancer and prevention of cancer in midlife. A questionnaire was administered to a representative sample of population listing 17 warning signs of cancer. The objective of the study was to assess the

sensitivity and specificity of visual inspection of cervix for detection of precancerous and early cancerous lesions of cervix. In this study 402 women underwent a detailed pelvic examination, visual inspection of cervix after 5% acetic acid application cytology (Pap smear), colposcopic examination and colposcopic directed biopsy when indicated. The result showed that the sensitivity of cytology (75.3%) was higher compared to that of acetic acid application (52.6%). This study recommended that screening for cervical precancerous and cancerous lesions using visual inspection aided by acetic may be a suitable low-cost and a feasible alternative modality for control of cervical cancer in a resource poor setting. For the treatment of cervical cancer, 80 to 90% of women with stage I cancer and 50 to 65% of those with stage II cancer are alive 5 years after diagnosis. Only 25 to 35% of women with stage III cancer and 15% or fewer of those with stage IV cancer are alive after 5 years.¹⁶

MATERIAL AND METHOD:-

Study Design and sample: A Quasi experimental research design was used for study. Sample was women from selected areas of Jalandhar, Punjab. Non probability i.e. convenient sampling technique was used. So, in present study the effectiveness of structured teaching programme was assessed on knowledge regarding prevention and warning signs of cervical cancer among women in selected areas of jalandhar, punjab, 2019.

Data collection and study tool: Prior to commencing the task of data collection formal permission was taken from the concerned authority and data was collected from 100 women in selected areas of Jalandhar. Data was collected by structured knowledge questionnaire related to prevention and warning signs of cervical cancer. Written informed consent was taken from each study sample. On the first day pre test was taken from control and experimental group and structured teaching programme was administered to experimental group and on the seventh day post test was taken from control and experimental group.

Result section:-

socio demographic characteristics of sample

There was association between post test level of knowledge of women regarding prevention and warning signs of cervical cancer and their socio demographic variables was significant between menstrual status of women in experimental group and occupation, qualification and residential area of women in control group.

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9264>

Abstract

This study mainly focused on the observance of RPMS guidelines and the Calamba East District teachers' performance and the development of an action plan that can enrich the utilization of RPMS and eventually improve the performance of the teachers. The descriptive research was utilized wherein a survey questionnaire was the primary source of data provided by seven school heads and the 162 teachers of Calamba East District for School Year 2015 – 2016 using the simple random sampling technique.

The findings revealed that the guidelines of the RPMS in its first phase which is performance planning and commitment are highly observed while in the latter phases which are performance monitoring and coaching; performance review and evaluation; and performance rewarding and development planning are only observed. The results showed that the assessments of the two groups of respondents on the observance of the guidelines of RPMS are not significantly different in the four phases/stages of RPMS. The teachers of Calamba East District obtain very satisfactory in their performance rating for S.Y 2014-2015. The study also revealed that the observance of the RPMS guidelines is not directly helpful in improving the performance of teachers of Calamba East District.

The implementation of the RPMS in Calamba East District is still ineffective since the observance of its guidelines is still vague for some school heads and teachers; Calamba East District teachers have done their best to earn a very satisfactory rating in teaching performance but still lack certain competencies to perform more expertly; and school heads and teachers both agree that the implementation of RPMS still needs improvement and a series of orientations are still needed in order to appreciate the entire system are the conclusions drawn based on the findings of the study.

Keywords: *performance management system, results-based performance, teachers' performance*

Introduction

Education plays an important role not only in individuals' life but in the entire community or society. It is through education that people gain knowledge and broaden their understanding about the world. It is also through this that people get respect and recognition. Education also helps in generating an advanced community. However, this can only be possible depending on the kind and level of education being provided by schools, with the help of the

teachers. For this reason, teachers' performance must be properly evaluated in order to assure the effectiveness of the teachers. Using the appropriate performance management system is very important.

The Department of Education is using the Results-based Performance Management System in evaluating the performance of the teachers. It is aligned with the strategic Performance Management System (SPMS) which has 4 phases/stages: Performance Planning and Commitment, Performance Monitoring and Coaching, Performance Review and Evaluation and Performance Rewarding and Development Planning. Despite the clear objectives of the use of Results-Based Performance Management System in evaluating the teachers in order to determine their effectiveness, still it encounters challenges and problems. In this regard, there is really a need for a study that will determine the relationship between Results-Based Performance Management System and the teachers' performance.

Objectives of the Study

The main objectives of the study were as follows.

1. To assess the observance of the guidelines of the RPMS with regard to its four phases or stages of implementation.
2. To recognize the performance rating of teachers for school year 2014-2015.
3. To determine the perception of the teachers and school heads on the observance of the guidelines of the RPMS.
4. To point out the relationship of the observance of RPMS and teachers' performance.
5. To develop an action plan can be offered to enrich the utilization of RPMS and to improve teachers' performance.

Methodology

Sample and Data Collection

The respondents of the study were the public secondary school heads and teachers of the selected secondary public schools in Calamba East District. Calamba East District has seven (7) public secondary schools, namely: Calamba Bayside National High School-TechVoc, Calamba Bayside National High School-SPA, Calamba City Science High School, Calamba National High School-Main, Calamba National High School-Annex, Barretto National High School, and Lecheria National High School. The total number of respondents was identified using stratified sampling technique. The teacher-respondents were selected using the simple random sampling technique. Thus, it is necessary to first ask permission from the school that will undergo the survey. The researcher sought permission from the Schools' Division Superintendent of Calamba City through a formal request to in order to distribute and retrieve questionnaires from the respondents. The request letter was signed and approved by the said authority prior to the schedule of data gathering. Moreover, a permission letter was also obtained to retrieve copies of teachers' performance ratings covering school year 2014 – 2015. Afterwards, two hundred questionnaires were sent out. After eliminating invalid questionnaires, 169 (84.5%) were retained for analysis.

Measures

A one-part questionnaire was used in the study which assessed the observance of the RPMS guidelines of school head and teachers in Calamba East District based on its four phases

or stages. The mean scores of respondent groups on the observance of RPMS guidelines are used to test learning performance of students. Items in all scales were rated using a four-point Likert Scale, ranging from 1 (not observed) to 4 (highly observed).

To evaluate the performance of teacher respondents the researcher used the previous result of the performance evaluation using the CB-PAST index of performance, if the summative rating is 3.51 or higher and no performance index of below proficient in any of the standards it means that the teachers' performance is **outstanding**; if the summative rating is 2.51 or higher and no performance index of below basic in any of the standards therefore the performance is **very satisfactory**; and if it is 1.51 or higher and no performance index of below basic in any of the standards then the teachers; performance is **satisfactory**, while if the summative rating is 1.00 or above with at least one performance index value below basic in any of the standards therefore the performance is **below basic**.

Proceedings

The questionnaire was developed based on the RPMS guidelines given by the Department of Education (DepEd). All the indicators presented in the researcher-made questionnaire was also aligned and followed the four-phase cycle of the RPMS consistent with the Civil Service Commission SPMS that provided the most important aspects to be evaluated, which were later reflected in the different items. The survey questionnaire was evaluated by the three experts. Two experts were from the Department of Education since RPMS was the focus of the study and which was the primary evaluation tool being used by the department to evaluate the teachers, and the other one was from the private sector which the researcher believes can give a suggestion to better improve the instrument. After getting the suggestions from them, the three agreed that the first part of the survey questionnaire which was about the profile of the respondents be removed since it was not part of the researchers' Statement of the Problem. Then, they recommended that the instrument be used for collecting the needed data.

Data Analysis

Raw data was converted into meaningful data through SPSS. The data needs to be edited, classified and tabulated so that it may become worthwhile for the required purposes. In order to draw conclusions, the collected data was analyzed and presented in the form of tables. Collected data was analyzed by using Pearson product-moment correlation.

Results

1. Observance of RPMS Guidelines

1.1. Performance Planning and Commitment

In terms of Performance Planning and Commitment, the school heads and teachers of Calamba East District assessed that the observance of RPMS guidelines is highly observed with a general assessment of 3.56.

1.2. Performance Monitoring and Coaching

The general composite assessment of 3.36 expressed that as a whole the guidelines are observed only in the implementation of RPMS in terms of monitoring and coaching with a general assessment of 3.36.

1.3. Performance Review and Evaluation

In terms of performance review and evaluation, this phase garnered a general assessment of 3.44 stating that the guidelines are observed.

1.4. Performance Rewarding and Developmental Planning

The general assessment yielded that guidelines are observed in terms of performance rewarding and developmental planning with a mean of 3.44.

2. Calamba East District Teachers’ Performance Rating for School Year 2014-2015

The mean average of 3.17 reveals that the performance of the teachers of Calamba East District is very satisfactory.

3. Difference between the Assessments of the Two Groups of Respondents on the Observance of the RPMS Guidelines

Table 1 revealed that there is no difference between the assessments of the two groups of respondents on the observance of the guidelines of Results-based Performance Management System.

Table 1 Comparison of Assessments of School Heads and Teachers on the Observance of RPMS Guidelines

AREAS	RESPONDENTS	GENERAL ASSESSMENT	T-VALUE	P-VALUE	DECISION	REMARKS
Performance Planning and Commitment	School heads	3.62	-.825	0.411	Accept Ho	NO Significant Difference
	Teachers	3.50				
Performance Monitoring and Coaching	School heads	3.34	.209	0.835	Accept Ho	NO Significant Difference
	Teachers	3.37				
Performance Review and Evaluation	School heads	3.47	-.377	0.707	Accept Ho	NO Significant Difference
	Teachers	3.41				
Performance Rewarding and Development Planning	School heads	3.51	-.858	0.392	Accept Ho	NO Significant Difference
	Teachers	3.46				

Test Used: t-Test @ 0.05 level of significance

4. Relationship between the Assessed Observance of RPMS and the Teachers’ Performance Rating

Table 2 showed that there is no significant relationship between the assessed observance of RPMS and the teachers’ performance rating in all the aspects.

Table 2
Correlation between Teachers’ Performance Rating and Assessed Observance of RPMS Guidelines

Variable 1: Performance Rating	Variable 2: Guidelines of the RPMS			
	Performance Planning and Commitment	Performance Monitoring and Coaching	Performance Review and Evaluation	Performance Rewarding and Development Planning
Pearson Correlation	-.015	-.002	.091	-.002
Degree of Correlation	Very small	Very small	Very small	Very small
P-value	.851	.977	.251	.984
Decision	Accept Null hypothesis	Accept Null hypothesis	Accept Null hypothesis	Accept Null hypothesis
Remarks	No Significant Relationship	No Significant Relationship	No Significant Relationship	No Significant Relationship

Test Used: Pearson Correlation @ 0.05 level of significance

5. The Proposed Action Plan

The study necessitates an action plan based on the findings of the study focusing on the key areas: *performance planning and commitment*– to discuss education competencies and Position Competency Profile; *performance monitoring and coaching*– to conduct coaching and mentoring programs for the teachers; *performance review and coaching*– to evaluate, identify the strengths and development needs of the teachers; and *performance rewarding and developmental planning*- to create and implement action plan to achieve developmental needs.

Conclusions

Analysis of the data and findings of the study led the following conclusions:

1. That the implementation of the RPMS is still ineffective since the observance of its guidelines is still vague for some school heads and teachers. This can be attributed to the unclear view about the whole process- the sense of being fair and beneficial. The process could be failing because teachers fail to appreciate the system as there are no tangible benefits attached to it.
2. That Calamba East District teacher have done their best to earn a very satisfactory rating in teaching performance but still lack certain competencies to perform more expertly.
3. That school heads and teachers both agree that the implementation of RPMS still needs improvement and a series of orientations are still needed in order to appreciate the entire system.
4. That the observance of the RPMS guidelines is not directly helpful in improving the performance of teachers of Calamba East District.
5. That an action plan is necessary since it can be a way to enrich the utilization of RPMS and definitely improve the performance of teachers.

Recommendations

On the basis of findings following recommendations are made.

1. The Department of Education must conduct a series of seminars not only for the school heads being the raters, but as well as for the teachers since they are the ones who are being evaluated using the RPMS so that there will be no confusion in the observance of the guidelines of RPMS and proper implementation will be conducted.
2. The teachers must use varied ways in teaching in order to gain outstanding rating during performance evaluation. However, the school heads must also initiate some programs in order to support teachers in their professional development.
3. The school head and the teachers must have proper coordination in order to avoid problems and miscommunication when it comes to performance evaluation.
4. The result of the performance evaluation must not only be the basis in evaluating the teachers' performance since it has a very little association with teachers' effectiveness, instead thorough training of all levels of teachers is critical so that the system could be understood and appreciated by teachers. Adherence to the tenets of the Results-Based Management System could go a long way in addressing some of the performance issues raised by teachers.
5. After establishing facts and details on the observance of the guidelines on the implementation of Results-Based Performance Management System, the offered action plan highlighting key results areas should be taken into consideration by Calamba East District to enrich the utilization of RPMS and eventually improve the performance of teachers.
6. Future researchers may conduct further studies that will focus on the other aspects of Results-Based Performance Management System and its relationship to other facets of teaching.

The Determinants of Rural-Urban Migration: Malaysia Case Study

Abstract - The purpose of this study is to determine the determinants of rural-urban migration in Malaysia. The annual data has obtained from 1988-2017 in Malaysia. There are various empirical approaches that have been employed in this study which are Augmented Dickey Fuller unit root test, Johansen-Jesulius Cointegration test, Vector Error Correction Model and Granger Causality test. The result shows there is absence of short run relationship between the population, household income, unemployment and poverty however the long run relationship between the variables are presence in rural while the urban has a short run and unidirectional causal relationship which is from the population to household income and the long run relationship between the variables also presence.

Keywords - Rural-Urban Migration; Malaysia; Time Series Analysis; Poverty; Population.

I. INTRODUCTION

The migration of migrants from rural areas to urban areas is an important process of the urbanization in developing countries. According to Purnomo (2009), the rural-urban migration is a process which will indirectly affect the urbanization and development of a country. This process is a natural process and it will deliver to the workforce destination. Due to this process, it impacts on the population movement flows and result in the rapidly growing population of the development of major cities. The overall data from The World Bank (2018) showed the total urban population in Malaysia has rose about from 48.2% or 8.21 million in 1988 to 76% or 24.03 million in 2017.

According to Yaakob and Masron (2010), the pull factors had an impact on migration process from rural areas to urban especially to cities or towns with the attraction of employment, education, social services etc. Other than that, other push factors from rural areas such as living environments, working conditions and environments, development opportunities and etc. also impact on this process (Lehmann et al., 2008). Urbanization is continuously occurring in a country which means that people migrate to cities or towns for a better standard of living. In other words, people migrate to urban areas because of people desire to find a better employment opportunities, educational opportunities and so on and this will result in development of a country (UNFPA, 2005). In addition, migration also is the way for people to get out from poverty trap and this will causing rapidly growing population of urban areas (Sari, 2009).

Internal migration able help migrants to increase their income level, enhance work experiences and also improve the life satisfaction level (Chamrathirong, 2007; Chowdury et al, 2012). However, Todaro (1980) argued that the rapid migration is not a best solution to solve the problem of labor demand in urban areas. According ro Chamrathirong (2007) and Todaro (1980), the rapid internal migration bring the rapid growth of population especially in urban areas and this phenomenon will motivate the people from rural areas migrate to urban areas in a short period of time. This will cause worsens in structural imbalances in terms of supply in urban and rural areas and also the growth of job seekers in urban areas imbalances.

Most migrants are more likely come from the former residents of poorest rural areas or from larger centers which with highest education level. There have many determinants affecting the movement of migrants from rural areas to urban, from between urban, from between rural areas and from urban to rural areas in Malaysia. Household income is the one of the factor on affecting the migrants move from the rural areas. It can be proven from the data of Department of Statistics (2018). For the mean monthly gross household income, household income for urban and rural areas, the household income gap between the two regions is very significant although total of household income for the two regions is seen to increase from year to year. In the year 1988, the mean of monthly gross income for urban household is RM 1,547 while the mean of monthly gross income for rural household is RM 919. For the year 2017, the average of monthly urban gross household income is RM 7,980 while the average of monthly rural gross household income is RM 4,660. Thus, it can be concluded that the household income gap for rural and urban areas is significant from 1988 until 2017. Other than that, unemployment rate and poverty rate also plays a role on the direction of migration.

II. LITERATURE REVIEW

Dahlan and Abdullah (1977) examined a study on trends of rural-urban migration in Peninsular Malaysia and its effects on migrant families. They used descriptive analysis to explain their observation on the trends of rural-urban migration in Peninsular Malaysia and its effects on migrant families. In this study, they concluded a proper and conducive home environment was the main factor affected the direction and patterns of rural-urban migration in Peninsular Malaysia because everything begins in the home. Thus, family plays an important role in community resource and they suggest government to have proper concern and develop family health development of migrants especially the poverty migrants.

A study conducted by Menon (1987) on job transfer as a determinant of migration in Malaysia. The researcher analyzed the migrants have to migrate most probably due to their jobs and careers depend on it. The jobs of most migrants are public servants, with managerial positions and with higher education. In other words, this means that forced employment are the main factor of migration in Malaysia.

Siwar and Yusof Kasim (1997) claimed that Malaysian urban poverty is lower than the rural poverty. However, this might be because of the way poverty is measured. Using income alone may not be sufficient enough. The living cost in rural and urban areas is different. Using a standard income measure will result in a lower poverty rate in urban areas than in rural areas. Using other socio-economic variables such as housing conditions, amenities and so on in measuring the incidence of poverty, might find higher poverty proportion in urban areas.

Rostam (2006) investigated on the patterns of population migration towards Klang Valley metropolitan peripheral areas in 1991 and 2000. Klang Valley experienced rapid growth of population due to Klang Valley expansion in the manufacturing and service activities. From the data, it can be seen that most migrants of Klang Valley were from Federal Territory Kuala Lumpur. In this study, the researcher analyzed the key factors affected the migrants migrate towards Klang Valley were the densely populated central areas of the metropolitan city, the high rent and price of houses in the central areas and the government decentralize policy which relocating the metropolitan city's functions to the peripheries.

Jali (2009) investigated on the movement of population in Malaysia in 1991 and 2000. He analyzed the movement of population categorized by three different levels which are the state level, the district level and the rural-urban level. The results showed that the short distance migration in Malaysia has decreased in recent years while the long-distance migration has increased most probably due to the higher living standard and better transportation infrastructures and facilities. He also found that the population of rural to rural migration higher than the population of rural to urban migration. He concluded that the rural to urban migration was no longer dominant in Malaysia but was the urban to urban migration. On the other hand, Yaakob, Masron and Masami (2010) examined the trends of urban migration in Malaysia from 1911 to 2000. From results of this study, he found that rapid population growth in urban areas of Malaysia occurred last nine decades especially during the 1980s and 1990s because the urbanization level in Malaysia rose about 18.4 percent from 1911 to 1970 and rose again

about 33.4 percent from 1970 to 2000. The rapid growth of urban population caused many problems to the basic needs of people such as housing, health, education, and sanitation facilities but the most serious problems were urban poverty and housing for the lower income group.

Hussain, Abdullah, and Abdullah (2014) studied on the relationship between rural and urban migration, household income and unemployment in Malaysia by using time series data from 1980 to 2011. The data used by the researchers showed that migration is positively affected by the household income level and negatively affected by unemployment rate for rural and urban migration in Malaysia. The methods they applied to analyze the data of the research are Augmented Dickey–Fuller (ADF) Test, Johansen Co-integration, Vector Error Correction Model (VECM) and Granger causality test to analyze the data of the research. For the unit root test result, all variables are significant at 5% and 10% significant level based on ADF test. The cointegration test result showed that at least one variable has a long run relationship with migration and the VECM showed that at least one variable has a short run relationship. For the Granger causality test, the results showed that migration is granger cause to household income and unemployment for the urban area while household income and migration are granger cause to unemployment and only household income is granger cause to migration for the rural area.

Malik (2015) examined the trends of rural-urban migration in Pakistan and its impacts on the social and cultural dimensions of the destination place. From the results of the study, he found that the trends of rural-urban migration in Pakistan rose largely and continuously from 2001 to 2011. This phenomenon caused the crowdedness in the urban centers and decreased the per capita resources available in the cities. This was due to government Pakistan was only focused on the development of developed cities and ignored the decline in the available facilities and resources are a major reason for the continuous development of urban.

III. DATA DESCRIPTION

The time period of this study is from year 1988 until year 2017 implicates 30 years which consist of 30 observations, used to examine the determinants of rural-urban migration in Malaysia. The data were drawn from the Department of Statistics. In this study, annually data is being selected to find the variables in term of percentage (%) for population, unemployment, poverty and Ringgit Malaysia (RM) for household income. The independent variables are household income, unemployment and poverty while the dependent variable is population in both urban and rural areas (as a proxy of rural-urban migration).

IV. MODEL SPECIFICATION

The theoretical model for this study is modified based on the model used by Hussain, Abdullah, and Abdullah (2014). From their studies, they have used certain variables for their empirical testing such as the household income and unemployment. However, this study will add on variable such as poverty, in order to investigate the relationship towards migration. In this study, the equation can be express as following:

$$POP_{it} = \alpha + \beta_1 HHI_t + \beta_2 UNEM_t + \beta_3 POV_t + \varepsilon$$

Where,

POP_{it} is the population for rural-urban of i and period of t ,

α is the constant term,

β denoted as coefficients,

$\beta_1, \beta_2, \beta_3$ and β_4 are parameters,

ε is the error term.

The set of independent variables include:

HHI_t = household income for period of t

UNEM_t= unemployment for period of t
 POV_t= poverty for period of t

V. METHODOLOGY

A. Augmented Dickey Fuller (Adf) Test

Dickey and Fuller (1979) who developed by Augmented Dickey-Fuller (ADF) unit root test would be employed in this study. The unit root tests must as the first test to run before run the cointegration test and Granger causality test. The purpose of unit root test is used for examine the stationary of times series data and first difference. The null hypothesis represents that the existence of unit root. Then, the variables are considered as non-stationary. Conversely, the alternatives hypothesis implies that there is no unit root which considered the series is stationary. To test the unit root, Dickey Fuller test (ADF) Act 1979 will be used for this method. ADF unit root test method is as follows:

$$\Delta Y_t = \alpha_0 + \sum_{i=1}^a \theta_1 Y_{t-1} + \sum_{j=1}^b \theta_j \Delta Y_{t-1} + \varepsilon_t$$

Without constant and trend:

$$\Delta Y_t = \delta Y_{t-1} + \mu_t$$

With constant:

$$\Delta Y_t = \alpha + \delta Y_{t-1} + \mu_t$$

Constant and trend:

$$\Delta Y_t = \alpha + \beta T + \delta Y_{t-1} + \mu_t$$

Where,

Δ is the first differentiation,

ε_t and μ_t are stationary random error.

The ADF test use t-statistic to examine the stationary of variables. The optimum lag length is chosen on Akaike Information Criterion (AIC). The decision of significance variable is based on critical value in 1%, 5% and 10% significance level. Based on the hypothesis of the unit root test, hypothesis H_0 will not be rejected which is meaning the variable is not stationary and have a unit root if the t-statistic obtained is greater than the critical value. Conversely, hypothesis H_0 is rejected which is meaning there is no unit root and the variables is stationary if the t-statistic is less than the critical value.

B. Johansen-Juselius (J&J) Cointegration Test

The purpose of this test in this study is to examine the long run relationship between the rural-urban migration and independent variables which are household income, unemployment, population and literacy. There are two tests that are required to carry out as part of the JJ test in order to determine the number of cointegrating vectors. The two tests which include the likelihood ratio Trace test and the Maximum Eigenvalue (λ - max) test (Johansen & Juselius, 1990). Trace test likelihood ratios is expressed as below equation.

$$T_{trace} = -T \sum_{i=r+1}^n \ln(1 - \lambda_{r+1})$$

Where,

T indicates the number of valid observations and

λ is the r^{th} largest estimated eigenvalue.

As for the Maximum Eigenvalue test is expressed as following:

$$\lambda_{max} = -TL(1 - \hat{\lambda}_{r-1})$$

Where,

T is the number of valid observations for the estimation use and

$\hat{\lambda}_{r-1}$ is the largest eigenvalue at r-1.

From the study conducted by Johansen and Juselius (1990), among this two test for cointegration testing the Maximum Eigenvalue test is much better and reliable than the likelihood ratio Trace test.

C. Vector Error Correction Model (VECM)

The VECM is used to analyze the existence of long run relationship between the variables after the cointegration is identify in the JJ cointegration test. The VECM model is as shown as below:

$$\Delta Y_t = \alpha_0 + \sum_{i=1}^n \beta_1 \Delta Y_{t-i} + \sum_{i=1}^n \beta_2 \Delta X_{t-i} + \gamma_1 ECT_{t-i} + \varepsilon_t$$

$$\Delta X_t = \varphi_0 + \sum_{i=1}^n \varphi_1 \Delta X_{t-i} + \sum_{i=1}^n \varphi_2 \Delta Y_{t-i} + \gamma_2 ECT_{t-i} + \mu_t$$

where Δ defined as the lag operator, $\alpha_0, \varphi_0, \beta_1, \beta_2, \varphi_1,$ and φ_2 represent the estimated coefficients, meanwhile n represent the optimal lags length, ε_t and μ_t are the serially uncorrelated random error terms, γ_1 and γ_2 measure as a single period response of the shock towards back to equilibrium.

D. Granger Causality Test

Finally, Granger causality test would be employed to investigate the short run causality between the variables. The null hypothesis H_0 will not be accepted if the variables are statistically significance at 1%, 5% or 10% level and probability is less than the significance level. Therefore, it can conclude that there are Granger causes between the variables. In contrast, the null hypothesis H_0 will be accepted if the variables are insignificance at 1%, 5% or 10% level and the probability is greater than the significance level. Thus, it concludes that those variables do not Granger cause each other. If the variable X is granger cause of Y and Y is also the cause of X, its means that the past of X help in anticipating the future Y. Similarly, the last value of Y also assists in the expected future value of X.

VI. RESULTS AND DISCUSSIONS

A. Unit Root Test

According to Granger and Newbold (1974); Phillips and Perron (1988), the results of regression results may be spurious if the variables has unit root (non-stationary). In order to avoid spurious estimation results, ADF unit root tests are selected to verify the stationarity or non-stationarity of the series of POP, HHI, UNEM and POV. The level and first differences of POP, HHI, UNEM and POV for rural and urban are checked and the results are shown in Table 1.

TABLE 1: Results on Unit Root Test of Rural and Urban

ΔUNEM	-4.776669 (0)* [-2.971853]	-4.699978 (0)* [-3.580623]	-4.520707 (1)* [-2.976263]	-4.569872 (1)* [-3.587527]
ΔPOV	-4.839497 (1)* [-2.976263]	-4.792107 (1)* [-3.587527]	-5.541433 (0)* [-2.971853]	-5.804476 (0)* [-3.580623]

Notes: The ADF tests are based on the null hypothesis of unit roots (non-stationary). Asterisks (*) indicate statistically significant at 5 percent level. Figure in parentheses are lag length. ADF refer to Augmented Dickey-Fuller unit root tests. The optimal lag length for ADF test is selected using the AIC. The asymptotic and finite sample critical values for ADF are obtained from MacKinnon (1996). The ADF test examines the null hypothesis of a unit root against the stationary alternative. Δ denotes first difference operator.

As Engle and Granger (1987) highlighted, only variables with the same order of integration could be examined for cointegration. Results in both tables showed that both of the tests are non-stationary which denoted at I(0). At first difference, in Table 1, all of the variables are stationary which denoted at I(1) in rural areas, while HHI is found non stationary in urban areas. These results are in line to the statement that most of the macroeconomics time series is stationary after first differencing but has unit root at level form (Nelson and Plosser, 1982).

B. Johansen And Juselius Cointegration Test

Table 2 displayed the results of the Johansen Juselius Cointegration test for rural and urban. The lag interval used is one lag.

TABLE 2: Results on Johansen and Juselius Cointegration Test for Rural and Urban

RURAL				
Hypothesized No. of CE(s)	Max-Eigen statistic	0.05 critical value	Trace statistic	0.05 critical value
r=0	39.56867*	27.58434	88.20585*	47.85613
r≤1	33.92195*	21.13162	48.63718*	29.79707
r≤2	13.40296	14.26460	14.71523	15.49471
r≤3	1.312269	3.841466	1.312269	3.841466
URBAN				
Hypothesized No. of CE(s)	Max-Eigen statistic	0.05 critical value	Trace statistic	0.05 critical value

r=0	49.48647*	27.58434	85.91512*	47.85613
r≤1	20.10958	21.13162	36.43046*	29.79707
r≤2	14.87606	14.26460	16.32087*	15.49471
r≤3	1.44811	3.841466	1.444811	3.841466

Notes: Asterisks (*) denote statistically significant at 5% level. Trace test indicates 2 cointegrating equation(s) at the 0.05 level and denotes rejection of the hypothesis at the 0.05 level while Max-eigenvalue test indicates 2 cointegrating equation(s) for rural and 1 cointegrating equation for urban at the 0.05 level and denotes rejection of the hypothesis at the 0.05 level.

Based on the result, we have enough statistical evidence to reject the null hypothesis at 5% level. Trace test indicated that there are two cointegrating vectors at 5% level of significance. From the results above, we can identify that there are long run equilibrium exists between the variables. Since there are cointegrating vectors exist, the VECM framework is adopted to examine the long run relationship between the variables. In particular, there are 2 cointegrating vectors found in rural, and only 1 cointegrating vector is found in urban.

C. Vector Error Correction Model And Granger Causality

Table 3 showed that the Granger Causality result that estimated through Vector Error Correction Model (VECM) and the Error Correction Term (ECT) for each variable of rural and urban. Based on the results, there is no relationship exists between POP, HHI, UNEM and POV in the short run. The ECT of POP in the tested model of rural is less than 1, statistically significant at 5 percent level of significant (equal to critical value of 1.96) and negative value. Thus, POP solely bear the brunt of short run adjustment to bring about the long run equilibrium. The ECT coefficient of POP is 39.4 percent. It means that coefficient of POP need 39.4 percent of adjustment to long run equilibrium in a year shows that Malaysia needed about 2.54 years to bring back to equilibrium.

TABLE 3: Results on Vector Error Correction of Rural Migration.

Dependent variables	RURAL					ECT
	ΔPOP	ΔHHI	ΔUNEM	ΔPOV		
	x ² statistic(p-value)				Coefficient	
ΔPOP	-	0.000882 (1.99171)	0.270891 (2.60769)	0.049900 (2.04031)	-0.393634*	-2.70469
ΔHHI	14.05584 (0.17031)	-	39.34591 (0.82349)	2.926443 (0.26015)	-56.68262	-0.84678
ΔUNEM	1.221862 (4.49163)	0.001972 (2.93669)	-	0.026125 (0.70461)	0.632260	2.86564
ΔPOV	1.093580 (0.84078)	0.002946 (0.91735)	1.341891 (1.78210)	-	4.110418	3.89641
Dependent variables	URBAN					ECT
	ΔPOP	ΔHHI	ΔUNEM	ΔPOV		
	x ² statistic(p-value)				Coefficient	
ΔPOP	-	0.000195 (0.84708)	0.333784 (3.97364)	0.191646 (2.86630)	-0.355232*	-4.26362
ΔHHI	7.356934 (0.04994)*	-	59.84285 (0.72447)	74.17799 (1.12818)	-46.09713	-0.56263
ΔUNEM	0.423130 (1.06932)	0.000512 (0.84245)	-	0.143144 (0.81053)	-0.068090	-0.30940
ΔPOV	1.020205 (2.07447)	0.000399 (0.52893)	0.020550 (0.07452)	-	0.357152	1.30582

Notes: The x²-statistic tests the joint significance of the lagged values of the independent variables, and the significance of the error correction term (s). The figures in parentheses are the p-values. Asterisks (*) indicate statistically significant at 5 percent level.

In urban areas, POP can Granger cause HHI in the short run. It means that POP has a unidirectional relationship with HHI. The ECT of POP in the tested model is less than 1, statistically significant at 5 percent level of significant (equal to critical value of 1.96) and negative value. POP solely bear the brunt of short run adjustment to bring about the long run equilibrium. The ECT

coefficient of POP indicates that the speed of adjustment to go back to the equilibrium is 35.5 percent, thus this implies that it takes about 2.82 years to bring back to the equilibrium.

VII. CONCLUSION

Generally, both rural and urban areas in Malaysia have seen a decrease in overall population but urban population still remain at positive while the houses of rural population drop from positive to negative. According to the data of The World Bank (2018), the rate of change of rural population decreased in unstable condition from 1.50% to -1.19% while the rate of change of urban population also decreased in unstable condition from 4.63% to 2.25% although total urban population keep increasing. There are many determinants affecting the rural-urban migration in Malaysia.

Malaysia actually does not have a direct policy on internal migration, but economic policies such as development of Bumiputera Commercial and Industrial Community under the Malaysia Plans, as well as the regional corridor development do have a significant impact on migration. For example, in 1999, the seat of government was shifted from Kuala Lumpur to Putrajaya and the Multimedia Super Corridor was created to reduce overcrowding and congestion in the Klang Valley. There are a number of urban management policies and these include the National Urbanisation Policy, National Physical Policy, National Housing Policy, and strategies for managing urban growth while enhancing productivity and efficiency of small towns and rural areas. More efforts are needed to promote the integration of migrants at the place of destination. The impact and effectiveness of population redistribution policies/ programmes also need to be evaluated.

In order to undertake this study on policy and planning implications, government needs to review the development policies in Malaysia for several years. The policy changed since independence from agricultural to industrial. There are many policies that have to be looked at such as the Agricultural Policy, the National Economic Policy, the Industrial Development Plan, the National Development Policy, the five year Malaysia Plans and many more. There would help the policy makers and planners to create a better plan for the future to minimize the problems caused by migration and urban population growth.

The unemployment also is one of the determinants of rural-urban in Malaysia. The size of the educational system would also influence the amount of unemployment. If employers hire better-educated workers preferentially, the education of an additional worker will lower the number of urban jobs available to uneducated workers by one, reduce the uneducated urban labor force by something more than one, and thereby lower the total number of urban unemployed. These workers will return to agriculture and add to national output there, while the educated workers might be more productive in the urban sector than their uneducated. Counterparts and further contribute to national output. Hence, we derive the somewhat paradoxical result that over education of the labor force might have the beneficial effect of both lessening urban unemployment and increasing national income in both the rural and the urban sectors.

Job hiring in the modern sector are more than the number of jobs, which primarily influences workers' location decisions. We have seen that a small increase in the number of jobs has a much larger proportional effect on job hiring and induces substantial rural-urban migration and increases the rate of urban unemployment. Thus migration can be stemmed simply by not growing so fast. For countries which need or choose to develop by enlarging their modern sectors rather than by improving the well-being of those in the traditional sectors, this creates a harsh dilemma: the cost of more rapid growth is the enrichment of some (the fortunate few who are hired for the newly- created jobs), the impoverishment of others (those who respond to the new incentives by choosing a high unemployment labor market search strategy), and greater inequality in the distribution of income. Hopefully, this conflict between growth and distributional objectives might be moderated by improving the functioning of labor markets as suggested above or by designing a tax- transfer system following Bhagwati and Srinivasan's guidelines. Thus, Harris and Todaro's pessimistic conclusion about the undesirability of modern-sector job creation may not be fully justified.

Abstract- To increase people's income and to find out the origin of *Gracilaria Sp.* Who has good quality, the government establishes the development of seaweed commodities as one of the entrances to progress and as a superior commodity. This research was conducted to analyze the marketing competitiveness of *Gracilaria Sp.* in Bone Bay, South Sulawesi Province. The competitiveness of seaweed marketing was analyzed using the Policy Analysis Matrix (PAM) method.

This research conducted in Bone Bay, South Sulawesi Province, from November 2018 to April 2019. The location was taken purposively by considering the existence of seaweed farmers in each district. This research is descriptive quantitative by using primary and secondary data. The number of samples used was 37 respondents

The results of the study show (1) the business of marketing seaweed *gracilaria Sp.* in Teluk Bone has comparative competitiveness. When viewed from the value of Social Profitability (SP), which is definite and Domestic Resources Cost Ratio (DRC) smaller than one. (2) Marketing of *Gracilaria seaweed Sp.* in Teluk Bone has a competitive value that would see from the benefit of Private Profitability (PP). In each has a positive value and Cost Ratio (PCR), that smaller than one. (3) Grass sea *Gracilaria Sp.* in Teluk Bone has a very high level of competitiveness. It indicated by a positive value (4+) of each farmer in Palopo City and Bone Regency that needs to get the main priority to develop. one of them is by increasing the value-added from processing (Half-Finished) especially who came from Palopo City because it was superior in quality compared to Bone Regency

Index Terms- *Gracilaria Sp.* Marketing, Competitiveness, Comparative and Competitive

I. INTRODUCTION

Seaweed is one of the leading commodities in the fisheries revitalization program, besides shrimp and tuna. Several things into consideration in their advantages, including the opportunity of a broad to open export market, relatively stable prices, and there are no restrictions or trade quotas for seaweed. Cultivation technology is simple to master; the cultivation cycle is relatively short and quickly provides benefits. Capital requirements are relatively small, which is an irreplaceable commodity because there are no synthetic products. The effort to

cultivate seaweed classified as a labor-intensive business so that it can absorb labor.

South Sulawesi Province has become one of the provinces that have experienced a significant increase in the field of seaweed cultivation. Which is likely to continue to increase because seaweed is one of the superior commodities of this region. The area of seaweed cultivation in this area reaches an area of 46,354.6 ha, which spread across several districts. Based on 2016 data, South Sulawesi seaweed production reached 3,409,048, 2 tons (DKP of North Sulawesi Province 2016).

Seaweed developed in South Sulawesi by farmers consists of 2 (two) species cultivated in the sea (*Eucheuma cottoni* and *Spiniosium sp*) and one species cultivated in ponds (*Gracilaria sp*). *Gracilaria* is one type of agar-producing seaweed (agarophyt) that widely found in Indonesian waters, especially South Sulawesi. *Gracilaria* seaweed generally contains called agarophytes as a result of its primary metabolism. Gelatin is obtained by extracting plant in an acidic or basic atmosphere and being produced and marketed in various forms, for example, flour gelatin, gelatin paper, and gelatin and processed into multiple types of snacks, pudding, jelly, and used as an additive in the pharmaceutical industry. Gelatin fiber content is relatively high so that gelatin consumed as diet food. Through specific processes gelatin is also produced for use in the laboratory as a bacterial culture medium or tissue culture (Angkasa *et al.* 2011).

Gracilaria seaweed as one of the leading commodities, its production continues to be driven in the coastal areas of Bone Bay and Makassar Strait. Based on data from *Gracilaria Sp.* 2016 shows the high productivity of *Gracilaria sp.* reached 76,771.90 tons in Palopo City and 87,397.80 tons in Bone Regency.

Although it designed as superior seaweed in South Sulawesi. Related to the issue of seaweed competitiveness, it still needs to be the main focus for improvement because it has a smaller market share. It happens because the production efficiency is still low and has not been able to meet increasingly high export quality standards.

The increasing international trade intensity makes productivity and competitiveness even more essential to note. Importing countries apply various requirements, especially concerning quality requirements for imported seaweed commodities in guaranteeing and protecting and consumer satisfaction.

The existence of quality standards set by each exporting country will affect the costs incurred by marketing agencies in the

process of collecting raw materials. The export process itself which will affect the amount set in the marketing process seaweed gains substantial profits. So, in the efforts to improve farm efficiency and marketing plant, competitiveness and marketing by region are very important. Deep understanding of this matter is essential, and therefore, it is necessary to research the problem in question. In detail, this study aims to: (a) analyze the financial and economic benefits of seaweed farmers *Gracilaria Sp.* (b) Analyze the competitiveness of the marketing of *Gracilaria Sp.* at the farmer level, (c) Analyzing the competitiveness level of *Gracilaria Sp.* At the level of the cultivator.

II. RESEARCH METHOD

The research will be conducted in November 2018 - April 2019. The research location is in Palopo City, South Sulawesi Province. Peng uptake or placement locations is done intentionally (*purposive*), taking into account the existence of farmers seaweed *Gracilaria Sp.* Cultivator samples take in a *simple random*

sampling where each population has the same opportunity to sample. The number of samples taken was 37 respondents.

Data analysis method

The analytical tool used in this study is the *Policy Analysis Matrix* (PAM) developed by Monke and Pearson (1995). The stages in preparing PAM Tables are as follows:

1. Identify all inputs used in the production process.
2. Allocate *tradable* inputs and *non-tradable* inputs.
3. Calculate the shadow prices of inputs, outputs, and exchange rates
4. Analyzing comparative and competitive advantages with the PAM model.

Policy Analysis Matrix (PAM)

The PAM model is used to analyze profits (private and social) and competitiveness (comparative and competitive advantages) with the formulations in Table 1.

Table 1. Matrix of policy analysis (*policy analysis matrix*)

Description	Output Receipt	Cost		Advantage
		Input Tradable	Domestic Factor	
Private Price	A	B	C	D
Social Prices	E	F	G	H
Divergence	I	J	K	L

Source: Pearson et al. (2005)

Information :

- Private Profit (D) = (A) - (B + C)
- Social Benefits (H) = (E) - (F + G)
- Transfer Output (I) = (A) - (E)
- Transfer Input (J) = (B) - (F)
- Transfer Factor (K) = (C) - (G)
- Net Transfer (L) = (D) - (H) = I - (J + K)
- Private Cost Ratio (PCR) = C / (AB)
- Domestic Resource Cost Ratio (DRC) = G / (EF)
- Nominal Output Protection Coefficient (NPCO) = A / E
- Nominal Input Protection Coefficient (NPCI) = B / F
- Effective Protection Coefficient (EPC) = (AB) / (EF)
- Profit coefficient (PC) = D / H
- Producer Subsidy Ratio (SRP) = L / E

Profit Analysis

Profit analysis consists of private profits (*Private Profitability / PP*) and social benefits (*Social Profitability / SP*). *Individual Profitability* (PP) shows the difference between revenue and costs received or paid by farmers. A PP value greater than zero (PP> 0) means financially profitable, or the commodity has a competitive advantage.

Private Profitability (PP) : D = A - (B + C)

= Private Receipt - (Input Tradable Fee (Private + Non Tradable Private Input Fee) (1)

Social Profitability (SP) shows the difference between revenue and costs calculated at social prices. If the SP value is more significant than zero (SP> 0), then it is economically profitable, or the commodity has an advantage comparative.

Social Profitability (SP) : H = E - (F + G)

= Social Receipts - (Social Tradable Input Costs + Non Tradable Social Input Costs) (2)

Comparative and Competitive Efficiency or Excellence Analysis

The level of business efficiency of a commodity can see from two indicators, namely comparative advantage, and competitive advantage. Competitive advantage can see from the value of the *Private Cost Ratio* (PCR). The ratio between domestic factor costs and value-added output from input costs traded on individual prices. If the PCR value is smaller than one (PCR <1), it indicates that the exploitation of the commodity is financially efficient or has a competitive advantage when there is government policy.

$$\begin{aligned} \text{Private Cost Ratio (PCR)} &= C / (A - B) \\ &= \frac{\text{Private Non- Tradable Input Fee}}{\text{Private Receipt - Input Cost for Private Tradable}} \end{aligned} \quad (3)$$

The comparative advantage of a commodity can see from the value of the *Domestic Resource Cost* (*Domestic Resource Cost* or DRC). The ratio of input costs that cannot trade with value-added output from input costs bought at economical prices. If the DRC value is smaller than one (DRC <1), then the business is commodities are economically efficient or have comparative advantages in conditions without policy.

$$\begin{aligned} \text{Domestic Resource Cost Ratio} &= G / (E - F) \\ &= \frac{\text{Non Tradable Social Input Costs}}{\text{Social Receipts - Social Tradable Input Costs ...}} \end{aligned} \quad (4)$$

Competitiveness Assessment Matrix

Competitiveness is reflecting in the range of commodities, including very high, high, medium, low, or very low competitiveness. These criteria are presenting in Table 2.

Table 2. Criteria for Assessing Competitiveness

Indicator	Value criteria				
PP	+	-	-	-	-
SP	+	+	-	-	-
PCR	+	+	+	-	-
DRC	+	+	+	+	-
Combined Value	4+	3+ and 1-	2+ and 2-	1+ and 3-	4-

Source: Kohari et al., 2005

Information :

PP: *Private Profitability*

PS: *Social Profitability*

PCR : *Private Cost Ratio*

DRCR : *Domestic Resource Cost Ratio*

4+ : Very High

3+ and 1- : High

2+ and 2- : Moderate

1+ and 3- : Low

4- : Very Low

The difference in the range of competitiveness in a commodity can be used to determine the priority scale of development of the related commodity, namely (Kohari et al., 2005):

- a. Products that have very high competitiveness are prioritized to develop.
- b. Commodities that have high competitiveness are still prioritized to develop, but more prioritized products that have very high competitiveness.
- c. Commodities with moderate competitiveness have two possibilities that would be developed and cannot extend. depending on whether the field studies are due to policy distortions or market failures.

- d. Meanwhile, commodities that have low or very low competitiveness should not need to develop.

III. RESULTS AND DISCUSSION

Business Description of *Gracilaria* Seaweed Cultivators *Sp* . in the Gulf of Bone

Cultivation of seaweed gracilaria sp. carried out in ponds located on the coast and near rivers. Cultivation is carried out with a one-time crop system to harvest several times.

Table 3. The stocking of Rata Land, Age, and Seaweed Production

No.	Regency / City	Description	total
1		Average arable land area (ha)	1.1
2	Palopo	Average plant age (days)	48
3		Average production (Kg / Production)	6,652
1		Average arable land area (ha)	1.0
2	Bone	Average plant age (days)	48
3		Average production (Kg / Production)	4.964

Source: Primary Data After Processing, 2019

The cultivated seaweed stocked in ponds with a size of 1 - 1.1 ha. Before conducting stocking, farmers usually do land preparation so that the quality of the plant produced has good quality, and can receive in the export market. Cultivation is carried out for 48 days, then harvested.

Macroeconomic Assumptions

The macroeconomic assumptions used in the *Policy Analysis Matrix* (PAM) analysis are nominal interest rates (% per year). Which obtained from information on formal credit interest rates (state banks, regional government banks, national private banks, foreign banks, and mixed banks, commercial banks, and other credit institutions). The nominal interest rate used is the average private interest rate for capital originating from formal credit institutions in the research location at 6% per year

For social interest rates (% per year), obtained from the sum of assumed *social opportunity cost of capital* of 15% per year plus

the national inflation rate in the year of the study. It consistent with the historical experience of Southeast Asian countries when they are at the same stage of development as Indonesia today. Based on data from Bank Indonesia on July 15, 2919, the national inflation rate in June 2019 was 3.28%. Thus the social interest rate was at the amount of 18.28% (Bank Indonesia, 2019). The exchange rate used to study is by the assumption of the State Expenditures Budget, which is in 2019 amounting to Rp. 14,129.00 per \$ (Bank Indonesia, 2019).

Policy Analysis Matrix (PAM) Gracilaria Seaweed Cultivator Sp.

Competitiveness of *Gracilaria Sp.* can know by using the *Policy Analysis Matrix* (PAM). The following are the results of the PAM analysis.

Table 4. Policy Analysis Matrix of Gracilaria Seaweed Cultivators Sp. in the Gulf of Bone

Districts/ City	Description	Reception Output	Cost		Advantage
			Input Tradable	Domestic Factor	
Palopo (N 23)	Private	27,620,983	2,035,000	4,424,783	21,161,200
	Social	281,965,696	2,035,000	5,967,791	273,962,904
	Divergence	(254,344,713)	0	(1,543,009)	(262,801,704)
Bone (N 14)	Private	17,375,000	804,730	1,241,786	15,328,485

Analysis of Private Profits and Social Benefits

Private profit or *Private Profitability* (PP) is an indicator of the financial efficiency of a commodity. Based on table 4 above from 2 regencies / cities after going through the calculation of Input-Output, price and budget on private prices and and Input-Output, prices and budget at social prices, where individual and social input-output consists of fertilizers, medicines, labor, working capital, land rent, and total production, while the price is the price of fertilizer/kg, medicines/liter, labor/day, working capital/ha, land rent, and seaweed prices/kg.

Table 4 shows that *Gracilaria Sp.* in Palopo City has a PP value that is greater than zero, which is Rp. 21.1612 million, condition showed that farmers financially profitable business or have a competitive advantage. In other words, when the

production is reasonable, and the price of seaweed is Rp. 4,152 turns out to cover production costs.

Social profit or *Social Profitability* (SP) is an indicator of the social efficiency of commodities under conditions of policy implementation. The calculation results show the SP value is greater than zero, which is equal to Rp. 273,962,904 . It means that seaweed farmers have a comparative advantage. The SP value nominally obtained if all seaweed produced by the cultivator is assumed to export. So, farmers will benefit more from selling their seaweed from the global market compared to the domestic market. In Table 4 for Palopo City, it can seem that the divergences produced are all negative, except *tradable inputs*. This negative divergence occurs because the social price of seaweed is higher than the price received by farmers. For divergence, *tradable inputs* indicate that the social price of *tradable inputs* is equal to the price received by farmers. Negative divergence in income value also

occurs because the seaweed farmers' financial income is smaller than their social income. This condition indicates that seaweed farmers in Palopo City, South Sulawesi, lost the opportunity to earn a profit per ha of Rp 252,801,704,

Private benefits acquired by farmers in Bone Regency, which are the results of an analysis of Rp. 15,328,485 which indicates that the value of PP is greater than zero, meaning that the cultivator's business is financially profitable or has a competitive advantage. In other words, when the production is normal, and the price of seaweed is Rp. 3,500 turns out to cover production costs. Whereas from the social benefits, the SP value is Rp. 121,508,379. This condition means that farmers seaweed has a comparative advantage. The SP value nominally obtained if all seaweed produced by the cultivator is assumed to export. So, farmers will get greater profits if they can export seaweed.

From the divergence value produced by seaweed farmers *gratulation sp.* in Bone Regency, everything is negative. Negative divergences occur because the price of seaweed social is higher than the price received by farmers. Negative divergence in income value occurs because the seaweed farmers' financial income is smaller than their social income. This condition indicates that seaweed farmers in Bone Regency, South Sulawesi, lost the opportunity to earn a profit per ha of Rp. 106 , 179,895 .

The differences income of seaweed farmers shows seaweed farming in each research location, especially in Bone Regency still faces many obstacles in increasing the production and quality of seaweed. The main constraints faced by farmers/cultivators in each research location are pests and diseases, degradation of seed quality after harvest, level of drought, and level of cleanliness.

Analysis of comparative advantage and competitive advantage

Comparative advantage and competitive advantage are indicators of the level of efficiency of seaweed farmers *Gracilaria Sp.* Competitive advantage can see from the value of the *Private Cost Ratio (PCR)* and the value of the *Domestic Resource Cost Ratio (Domestic Resources Cost Ratio or DRC)*

Private Cost Ratio is the ratio between domestic factor costs and value-added output from input costs traded on individual prices. If the PCR value is smaller than one, it indicates commodity is financially efficient and has a competitive advantage. While the Domestic Resource Cost Ratio is the ratio between domestic input costs and revenues minus *tradable inputs* at social prices. If the DRC value is smaller than one, it indicates that a commodity is socially efficient and has a comparative advantage. Complete information about the importance of PCR and DRC can see in Table 5.

Table 5. Value of Competitive and Comparative Advantage Parameters of *Gracilaria Seaweed Sp.*

Regency / City	Parameter	Value
Palopo	PCR	0.17
	DRCR	0.02
Bone	PCR	0.07
	DRCR	0.02

Data Source: Primary Data After Processing, 2019

Based on Table 5, it can see that social benefits represent the difference between revenues and all costs incurred in the seaweed cultivation business of *Gracilaris Sp.* Per hectare at shadow prices (social), i.e., rates that are influenced by government policies such as subsidies and taxes.

The DRC value obtained by domestic facts / tradable inputs, so that the value derived from each seaweed cultivator is 0.02 and 0.02 respectively for Palopo City and Bone Regency. The results of this analysis state that the farmers of Palopo City and Bone District have comparative advantages. That means if to get an added value of 100 \$, additional internal factor costs of 2 \$ are needed for Palopo City and 2 \$ for Bone Regency or in rupees of Rp. 28,258 for Palopo City and Rp. 28,258 for Bone Regency.

Comparative advantage is only used to measure the benefits of economic activity in terms of the whole society or general. Therefore, in the development of relevant concepts to measure financial feasibility, the idea of competitive advantage is used.

Analysis of competitive advantage is used to measure financial feasibility. Based on table 5, it can see that seaweed cultivation businesses from Palopo City and Bone Regency have

a PCR value <1, which is equal to 0, 17, and 0.07. The results of the analysis state that farmers in Palopo City and Bone District have competitive advantages; this means to increase added value output of Rp. 100,000 in special prices requires additional domestic factor costs of Rp. 17,000 for Palopo City and Rp. 70,000 for Bone Regency.

Coconut Farming Competitiveness Matrix Assessment

Competitiveness is reflecting in the range of commodities, including very high, high, medium, low, or very low competitiveness. Based on the analysis and interpretation above, each indicator of competitive advantage and comparative advantage, namely *Private Profitability (PP)*, *Social Profitability (SP)*, *Private Cost Ratio (PCR)* and *Domestic Resources Cost Ratio (DRC)* given positive or negative values. For example, if a profitable PP has given a positive value, conversely if the loser is giving a negative value. The combined positive and negative values of the four indicators used as competitiveness assessment criteria, as in Table 6.

Table 6. Matrix for Assessing the Competitiveness of Gracilaria Seaweed Cultivators Sp. in the Gulf of Bone

Districts/ City	Indicator	Value	Criteria	Meaning	Combined Value	Competitiveness
Palopo (N 23)	PP	21,161,200	+	Competitive	4+	Very high
	SP	273,962,904	+	Competitive		
	PCR	0.17	+	Competitive		
	DRCR	0.02	+	Competitive		
Bone (N 14)	PP	15,328,485	+	Competitive	4+	Very high
	SP	121,508,379	+	Competitive		
	PCR	0.07	+	Competitive		
	DRCR	0.02	+	Competitive		

Source: Primary Data After Processing, 2019

The results of the assessment in Table 6 show the PP value of Rp. 21,161,200 and PCR 0.17 included in the decisive criteria, which means that they have competitiveness, while the SP value is Rp. 273,962,904 and DRCR 0.2 also included in the critical measures, which means that farmers in Palopo City have competitiveness and cultivators in Bone Regency, showing PP value of Rp. 15,328,485 and PCR 0.07 included in decisive criteria, which means they have competitiveness while the SP value is Rp. 121,508,379 and the DRCR value of 0.02 also included in critical standards, which means that it also classified as having competitiveness. So that if the costs are combined, there will be a positive value of 4. The combined values indicate that *Gracilaria Sp.* in Palopo City and Bone Regency, the competitiveness is very high, but seaweed farmers from Palopo City are superior.

IV. CONCLUSION

This study concludes that the business of marketing seaweed *gracilaria Sp.* The farmers in Teluk Bone have comparative competitiveness when viewed from positive *Social Profitability* (SP) and smaller than one *Domestic Resources Cost Ratio* (DRC). Cultivators of seaweed *Gracilaria Sp.* in Teluk Bone has competitiveness that describes from the value of the positive *Private Profitability* (PP), *Cost Ratio* (PCR) and the marketing of *Gracilaria Sp.* Teluk Bone has a very high level of competitiveness. It is indicated by positive values (4+) from Palopo City and Bone Regency that needs to get the main priors to develop. One of them is by increasing the value-added from processing (Half-Finished), especially from Palopo City, because it is superior in quality compared to Bone Regency.

V. ACKNOWLEDGMENT

The implementation of this research is something to be grateful. The author expressed many thanks to all those who helped specifically for the Center Marine and Fisheries Education,

the ministry of maritime Affairs and Fisheries for support was given starting from the beginning of this study to the publication of this journal.

Abstract - This study aims to determine the effect of mind mapping learning on grade X students' affective learning outcomes on human material. This study uses an experimental research design, a type of pre-experimental one shot case study. Data collection techniques used in this study used observation with a data collection tool observation sheet attitude of students. The research subjects were students of grade X-2 majoring in social sciences as many as 38 students. This study uses a non-parametric test to determine the effect of mind mapping learning on students' affective learning outcomes. Non parametric tests are used because data is not normally distributed. The binomial test was used to determine the effect of mind mapping learning on students' affective learning outcomes. The binomial test shows a significance value of 0,000. Because the binomial significance value of 0,000 > α 5%, there is the effect of mind mapping learning on students' affective learning outcomes in early human matter. Thus learning mind mapping can be used in learning to improve student's affective learning outcomes.

Keyword- mind mapping, affective learning outcomes, senior Islamic high school

I.INTRODUCTION

Learning outcomes are the most important element in the world of education (Casperson, 2014) and are key to learning (James, 2005). Bloom stated in the learning outcomes related to cognitive, affective and psychomotor aspects. On the cognitive aspects related to students' knowledge in learning. On the affective aspects with regard to student attitudes during the learning process and on aspects of skills relating to student skills (Suprijono, 2013).

The results of affective learning involve changes in the feelings, motivations and attitudes of students that arise from the process of experiencing learning (Buma, 2018). Affective learning outcomes are learning outcomes relating to the values, attitudes and behaviors of students. Affective learning outcomes are closely related to students' ability to listen and respond to others when interacting. Affective learning outcomes also relate to the ability within students to adapt according to situations and conditions (Shephard, 2008). Thus affective learning outcomes are learning outcomes that are far more complex compared to other learning domains, because affective learning outcomes have an important role in changing students' behavior and mindset (Ilonen and Heinonen, 2018).

One of the lessons that can shape students' affective abilities is mind mapping. Mind mapping directs students to explore the relationships between concepts in learning. The relationship between concepts in mind mapping allows students to understand the relationship according to their thinking abilities (Davies, 2010). Mind mapping is a method that can connect concepts through structure and images. Mind mapping can also make learning more meaningful (Polat et al., 2017). Mind mapping can effectively improve student learning outcomes, foster collaboration and enhance student creativity in learning (Hua and Wind, 2018). Mind mapping itself is an effective learning pattern to stimulate knowledge and make learning more enjoyable (McCrea and Lorenzet, 2018).

Previous research stated that mind mapping brings new enthusiasm to improve students' ability to master subject matter (Mento et al., 1999). Through mind mapping learning, there are positive effects on improving student learning outcomes in learning (Liu et al., 2014). Mind mapping is able to direct students to build knowledge in learning. In

addition, through mind mapping learning students can think critically in solving each problem faced by different styles (Ismail et al., 2010).

Based on previous research, the assessment of learning outcomes using mind mapping tends to assess cognitive learning outcomes and has not touched on other aspects. In this study, researchers assessed the effect of mind mapping learning on students' affective learning outcomes. Assessment of affective learning outcomes is closely related to the learning environment. The influence of the learning environment on the affective learning outcomes of students has a close relationship in determining student achievement (Sivan and Chan, 2013). The main view in assessing student learning outcomes is through student learning. In designing assessment of learning outcomes must be based on competencies developed by the teacher to meet student-oriented learning goals (Erikson and Erikson, 2018). Thus the purpose of this study was to reveal the effect of mind mapping learning on students' affective learning outcomes on ancient human material in Islamic senior high school.

II. THEORITICAL FRAMEWORK

2.1 Mind Mapping

Tony Buzan introduced mind mapping in 2004. Mind mapping is a learning strategy that is used to stimulate knowledge with a series of maps that have been conceptualized. Huda stated that mind mapping is one of many strategies to improve student thinking (2015, p. 307). Ngalimun stated that mind mapping learning is very suitable for students' initial knowledge review (2017, p. 348). Making mind mapping in historical learning is accompanied by a combination of colors, images, and curved branches. Through this method, it is expected to facilitate students in remembering the information contained in mind mapping. Mind mapping is the easiest method to use to extract information from inside and outside the brain. The steps for making mind mapping are as follows.

- a. The materials and tools used in making mind mapping are blank paper without lines and colored markers, students have been able to make mind mapping personally. The steps in making mind mapping are as follows.
- b. It starts with providing materials and tools in the form of blank paper without lines and markers placed on a flat plane. Then write the keyword in the middle of the paper and give the branch according to the desired concept in all directions to express it.
- c. Write down the central idea represented by the image. Images that have a thousand words and use imagination to develop the concept. Images will give more meaning and help students stay focused.
- d. Make branches related to central ideas. The existence of these branches can make it easier for us to remember and the relationships between the concepts made. In making branches, you should use lines, different colors and arrows to connect the central idea with supporting ideas.
- e. Using one keyword for each branch, a single keyword will make it easier to spur the emergence of new ideas and thoughts.
- f. Use different colors in each writing. Color diversity in mind mapping will make writing more interesting and stimulate the right brain to work better (Huda, 2015, p. 309).

2.2 Learning Outcomes Affective

Gagne states that learning is a process of changing behavior through experience. Behavior changes according to Benjamin S Bloom consist of three aspects which consist of cognitive aspects, affective aspects and psychomotor aspects. On cognitive aspects, related to students' abilities in knowledge processing. In the affective aspect, related to attitudes, feelings, interests and morality. In psychomotor aspects, it is related to the function of the nervous system, muscles, and physical functions. In general, teachers tend to make cognitive assessments and override affective and psychomotor assessments in students in the learning process. Wood (1996) affective assessment is a method used to reveal how a student feels about himself and the self-image that influences the environment (Basuki and Hariyanto, 2016, p. 184). Thus the objectives in the assessment of affective learning outcomes can be seen from the attitudes of students in the learning process. The attitude assessment in this study consisted of honest, disciplined, polite and responsible

III. METHOD

The research design used in this study was an experiment with a type of pre-experimental one shot case study design. Design uses one class in research without pre-test. Treatments were given directly by using mind mapping and then doing a post test in learning.

Figure 1
 Pre Experimental Research Design (One Shot Case Study)

Description:

- O : Posttest, to find out the affective learning outcomes of students after using mind mapping
- X : Treatment of mind mapping learning

(Chreswell, 2014)

This research was conducted at MAN 1 Pontianak, West Kalimantan , Indonesia. The sampling technique used was simple random sampling. The subjects in this study were students of grade X-2 majoring in social science. Data collection techniques with observation and data collection tools using observation sheets. Before conducting the research, the researchers tested the observation sheets of affective learning outcomes of students in different classes to find out the quality of the observation sheet that would be used in

IV.RESULT AND DISCUSSION

The study went through two stages consisting of expert validity and results of field research and statistical analysis. The following will be elaborated in detail the two steps carried out in this researcher.

3.1 Expert Validity

Expert validity was used to determine the quality of the instruments used in the study. The following are the results of the instrument validity of the student's observation sheet attitude.

Table 1. Results of Validity of Student Attitudes Instruments Observation Sheet

No.	Aspect Assessed	Value			Average	Kreteria
		V1	V2	V3		
1	Substance of	3.83	4	3.5	3.78	Very Good
2	Construction	3.83	4	3.5	3.78	Very Good
3	Languages	3.67	4	4	3.89	Very Good
Validator		3.67	4	3.44	3.76	Very Good

Description:

- V1: Validator 1
- V2: Validator 2
- V2: Validator 3

The substance aspect developed in the observation sheet is the attitude of students categorized very highly good with an average value of 3.78. The indicators developed in the aspect of substance consist of an assessment of students' honesty, student responsibility, student discipline, and polite students listed in the attitude assessment observation sheet. The construction aspect that was developed in the observation sheet was the attitude of the categorized students was very good with an average score of 3.78. Indicators developed in the construction aspect consist of including subject identity, assessment instructions, assessment rubrics, and assessment aspects. In the aspect of language, the observation sheet of the attitude of students developed has a very good category with an

average value of 3.76. The indicators that are assessed on aspects of the language include the use of good and correct Indonesian, communicative language and do not confuse privacy or groups.

Criteria for the withdrawal of decisions on the instruments of the observation sheet of students' attitudes are adapted from Riduwan (2014), as follows.

Table 2. Student Observation Quality Criteria Student

Value Interval	Value	Category
3.5	$3.5 \leq P \leq 4.0$	Very Good
2.9	$2.9 \leq P \leq 3.4$	Good
2.3	$2.3 \leq P \leq 2.8$	Good Enough
1.7	$1.7 \leq P \leq 2.2$	Less Good
1.0	$1.0 \leq P \leq 1.6$	Not Good

Based on the results of the assessment conducted by three validators, it can be concluded that the instruments of the student observation sheet can be used because they are very well categorized with an average score of 3.76.

3.2 The results of research in the field and statistical analysis

The following will describe the results of research in the field and statistical analysis used in the study. The study was conducted for one month. In the first three weeks, researchers gave mind mapping learning treatments to students and one week later the researchers assessed students' attitudes after the implementation of mind mapping learning in the classroom. The assessment results of student attitudes are as follows.

Table 3. Value of student attitudes

No	Name	Value of Students
1	PS2-1	100
2	PS2-2	98
3	PS2-3	100
4	PS2-4	95
5	PS2-5	100
6	PS2-6	97
7	PS2-7	98
8	PS2-8	100
9	PS2-9	95
10	PS2-10	97
11	PS2-11	100
12	PS2-12	100
13	PS2-13	97
14	PS2-14	98
15	PS2-15	98
16	PS2-16	100
17	PS2-17	100
18	PS2-18	100
19	PS2-19	98
20	PS2-20	98
21	PS2-21	100
22	PS2-22	100
23	PS2-23	98
24	PS2-24	100
25	PS2-25	95
26	PS2-26	97
27	PS2-27	98
28	PS2-28	98
29	PS2-29	100
30	PS2-30	100

31	PS2-31	95
32	PS2-32	100
33	PS2-33	100
34	PS2-34	97
35	PS2-35	100
36	PS2-36	98
37	PS2-37	98
38	PS2-38	98

Based on the attitude value of students it is known that the mean value of students' attitudes is 98.45, median is 98.00, variance is 2.740 and standard deviation is 1.655. Statistical analysis was used to determine whether mind mapping learning had a significant effect on students' affective learning outcomes. The statistical analysis in this study will be presented as follows.

Table 4. Nominality Test for Distribution

Shapiro-Wilk			
	Statistics	df	Sig.
Social attitudes	.806	38	.000

Normality tests were distributed using the Shapiro Wilk test with results of 0,000. The post test significance value is $0,000 < \alpha 5\%$ so the data is not normally distributed. Because in this study the data were not normally distributed, the researchers used binomial tests to determine the effect of mind mapping learning on students' affective learning outcomes. The binomial test results are as follows.

Table 5. Test of Binomial

		Category	N	Observed Prop.	Test Prop.	Asymp. Sig. (2-tailed)
Affective	Group 1	≤ 75	0	.00	.50	.000 ^a
Learning	Group 2	> 75	38	1.00		
Total			38	1.00		

Binomial significance value of $0,000 > \alpha 5\%$, the categorized data is very significant. Thus there is a significant effect of mind mapping learning on students' affective learning outcomes.

Skinner states that learning is a process of behavior change. Behavior changes are obtained through the process of operant conditioning. In connection with the research conducted, changes in student attitudes occur because there is operant conditioning carried out in learning. operant conditioning in this study is learning using mind mapping. Mind mapping is used in research to change the behavior of students who previously tended not to respond to subject matter well. With the implementation of mind mapping learning, there is a change in student behavior, especially in student attitudes. Learning by using mind mapping has a positive effect on students so students feel interested in learning.

David P. Ausubel said that meaningful learning is learning that involves understanding how new information can be effectively organized, incorporated into structures, and taught so that it can be used. Meaningful learning occurs when students can connect new phenomena into their knowledge structure. Mind mapping learning is learning that links between concepts in learning, where in forming students' knowledge as a whole links between concepts based on the phenomenon being studied. Through mind mapping learning, students not only focus on strengthening cognitive aspects but also on students' attitudes in learning.

V.CONCLUSION

Learning does not only depend on cognitive enhancement of students, but also must be accompanied by changes in student attitudes. Changes in student attitudes are the result of a process of growth and development that must be maintained. Changes in student attitudes can be seen from the behavior of students in the teaching and learning process. This study has a research focus on the learning outcomes of student attitudes in learning. Based on the results of the study, it was found that mind mapping learning had a significant influence on the affective learning outcomes of students' attitudes in the learning process through binomial testing.

Abstract: The purpose of this research is to know the readability of the book of folklore that is about Kamanippah Ancestor Enggano. This research was conducted by analyzing against the book of folklore and uses data readability calculations where looking for a hundred, a hundred in the first word of the second word and one hundred third Alenia said in the book. Quantitative data obtained from the calculation of sentences and words, while qualitative data obtained from the results of the analysis of the book and use the calculation chart fry. Based on the research, the average value of the number of terms 100 words is 11.23 and the average value of the number of sentences 100 words is 146.4. Of the three paragraphs taken from the first 100 words of the paragraph, the middle and last can be concluded that the legibility of the Kamanippah folklore of the Enggano Ancestors can be read for the 5th, 6th grade elementary school and for the junior high school in 7th grade.

Keywords: *Abstract, Readability, Folklore, Ancestors, Chart Fry*

INTRODUCTION

National Education Standards Agency (BSNP) set "legibility discourse" as one of the criteria that must be met by every textbook. On the other hand, apparently there are many textbooks that do not have a high level of legibility. If books like this still will be used as teaching materials in the classroom, teachers need to align its discourse with students' literacy first. Bertemali with this, Harjasujana (1987: 25) reminds us (read: Master) through the following statement: "One of the tasks is a strong challenge paramount for teachers of junior and senior is to align the student with a book that can be used effectively".

To do that of course, teachers need to have sufficient competence and performance in the field. In fact visible impression that the concept of legibility is not fully understood by most people, including academic circles once. It looks at the use of the term in a sentence. They often exchange the use of the term "legibility" with "keterpahaman", as if the two terms have the same meaning.

Readability is derived from the word "Readability" is derived from "Readable", meaning that it can be read or illegible. Readability is about to read whether or not a particular reading material by readers. Readability questioned the level of difficulty or ease tigkat a particular reading material for a particular reader ratings. Readability is

an appropriate measure of whether or not a reading for a particular reader in terms of level of difficulty or ease of discourse. To estimate the readability level of reading material, used a variety of formulas readability. Readability is usually expressed in terms of class rank. After measuring the readability of a discourse, people will be able to determine the suitability of the material for a particular class rank.

Muslich (2010: 85) states that legibility is the level of ease of an article to be understood his point. According to him, legibility is concerned with understanding. Reading that meets the suitability of legibility is reading that can be understood by the reader. Readings can not or difficult to understand the reader is reading that does not meet the suitability keterbacan. Readings are easily understood reader is also a reading that does not meet the suitability keterbacan.

Tampubolon (1990: 213) states that legibility is appropriate or not a reading for a particular reader in terms of the difficulty level. Said to be appropriate if the reading is not too difficult and not too easy or moderate. Said to be appropriate if the reading is difficult or easy. If the reading is too difficult, the reader is forced to read slowly, even repeatedly to understand the readings were read. He will not be impatient, lazy, even frustrating that it can not achieve the desired goal. Instead, reading is too easy to make the reader bored or underestimate because there is no challenge, feeling worthless, or felt it could be or know.

Mulyasa, (2013: 49) one key to success that determines the success of the implementation of the curriculum in 2013 is adequate learning resources, and should be realized, that until now the textbook is still a very important source of learning for students. To improve the quality of textbooks as a source of information, content or meaning is conveyed through text books need to be considered and presented in a form that is not only visually appealing but also easy to understand that aspect of legibility (readability) of a book reading or reading text.

Readability of a reading or text must be in accordance with the reading ability of readers. Further Klare (1984: 726) states that the reading has good readability level will affect readers in increasing interest in learning and memory, increase speed and efficiency of reading and nurture reading habits. Therefore, that aspect of legibility should be noted that the reader (students) are not only able to understand the meaning or content of textbooks but also can increase learning motivation.

Edward Fry readability formula introduced in the form of a graph called the Fry Graph (Nurlaili, 2011: 171). Formula legibility in this chart is based on two factors, namely short length and difficulty of the words marked by the number of words (many-at least) syllables that make up each word in the discourse. Therefore Fry basing its study on two main factors, namely (1) panjangpendeknya sentence and (2) the complexity of the short length of the word or words. The advantages of the Fry Graph readability formula is the result of an effort to simplify and pengefisienan technique of determining the level of legibility. which states that, "Fry Graph is the result of efforts to simplify and streamline the determination technique readability level of discourse.

Based on the results of the initial analysis, the researchers found that the students a story book entitled "Ancestors Kamanippah Enggano" where the book is suitable for classroom reading materials VI. This can be evidenced by the use of diagrams fry, where there are errors in some aspects such as the content of the story. In addition there is another aspect that is also important to note that aspects of legibility. Attempts

to test the suitability of a text or reading storybook students, researchers conducted in-depth studies to measure the readability of readings in the textbook readings.

METODOLOGY

Analyzing a sentence can not be separated from a text or discourse therefore the understanding of the text content is also very necessary, will therefore be clearer if we understand well the meaning of the text and discourse. Fairclough (1994: 5) provides an explanation of a text, traditionally a part of the written language as a whole 'work' like a poem or a novel, or a relatively discrete parts work as a chapter. Then, in the conception somewhat wider and has become common in discourse analysis, where the text may be either written or oral, such as the words used in conversations can also be said as a text.

Text is the data in the analysis of discourse, both spoken and written text. The text in this case refers to the shape of a kalimat transcription or speech circuit. Kridalaksana (2011: 238) in the Dictionary of linguistics states that the text is (1) a complete set of abstract language, (2) a row of sentences, words, and so on that form of speech, (3) the speech produced in human interaction. A text is also seen in terms of the intent and meaning diujarkan. Text has the unity and cohesion between the contents to be conveyed in the form of speech, and the situation existing conditions. In other words, that the text is merely the expression of the form language of which consists of a unity between the content, form, and situation conditions of use.

Readability relates to a sentence or text form easily understood when read, understand and remember the purpose and meaning of the text. Readability is a reading element that affects the overall success achieved by a group of readers with such materials (Hafni, 2005: 13). Readability is a matter that can read text in a fast, easy to understand, understood, and remembered. (Department of Education: 1998). Readability is often associated with the happenings of whether the material is read by readers (Tampubolon, 2008: 213).

Readability in English terms is called readability. Readability in teaching reading difficulty of the level of appropriate reading materials students read. Legibility (readability) is a measure of the suitability of a reading for a particular reader in terms of level of difficulty / ease of discourse.

To estimate the readability level of reading material, there are a number of measuring devices readability formula that takes into account such variables as determinants of text legibility, which is formula Flesch, Fog Index, Graph Fry, SMOG, and BI. Readability formulas is a formula that gives the figure as Sitepu readability index (in Yasa, 2013: 239).

Readability formulas are developed based on existing English and Indonesian based. Based English as Flesch formula, Fog Index, SMOG, and Graph Fry, while Indonesian is a formula-based BI. All the readability formulas developed to predict whether the material will be more difficult or easier to understand the reader when compared with other reading materials (Ginting, 1990).

Fry Graph formula using a variable difficulty and complexity of grammatical words as determinants of text readability. The calculation method is not much different from the previous formula, but after it was discovered on the calculation difficulty and complexity of grammatical word is then matched with a graph Fry. The measurement accuracy of discourse text readability with Fry Graph is determined by counting the exact number of syllables, words and sentences in the discourse. Steps of use readability using graphics fry measurement are as follows:

1. Choose a representative fragment of discourse to be measured readability level by taking 100 pieces of words of discourse to be measured keterbacannya.
2. The meaning of the word in this case is a group of symbols dikiri and dikanannya delimited. Thus the following symbols, such as Fatima, Teachers' Training College, 1999, and = each is considered as one word.
3. Count the number of sentences of the 100 words to the nearest decimal. That is if the word included in the word count of a hundred pieces (samples discourse) does not fall at the end of the sentence, the sentence calculation will not always intact malainkan always will be residual.
4. The rest of the course is a word that is part of a row of words that form a complete sentence. Due to the necessity of sampling discourse based on the number 100, then the rest of the words included in a matter of a hundred it diperhi-tungkan in decimal form (by tens).
5. Count the number of syllables of discourse samples 100 pieces words. As a consequence of the limitation of words (as described in step 1) above to enter numbers and abbreviations as words, to the word and abbreviation, each symbol counted as one syllable. For example, 234, is composed of three syllables, Teachers' Training consists of four syllables.

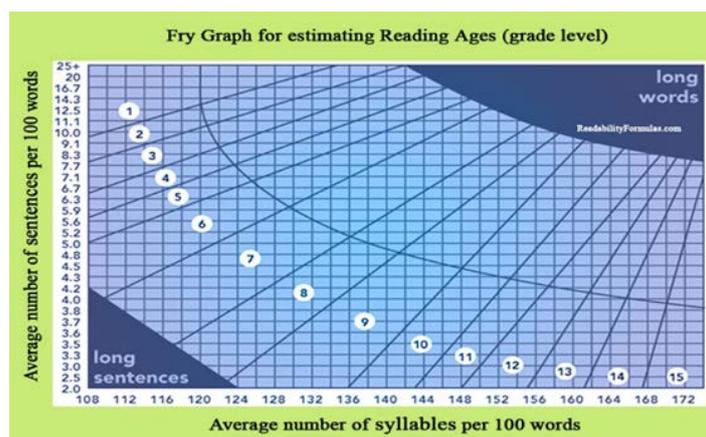

Figure 1. Table Graph Fry

Note the Fry graph above. Perpendicular column shows the number of syllables per hundred words and a horizontal line shows the number of sentences per hundred words. The data that we obtained in step (2), which is the average number of sentences and the data we obtained in step (3), which is the average number of syllables plotted into a graph to find points temunya. The meeting between the vertical line (the number of syllables) and the horizontal line (the number of sentences) showed levels reader class which is able to read the chosen discourse. If the line crosses the vertical and horizontal lines that are in the dark area or the shaded area, the discourse is declared invalid. Therefore it must have another discourse and repeat the same steps as described earlier.

Fry is a research chart for English language discourse. Though the structure of the English language with the Indonesian differ greatly, especially in terms of syllables. Based on this reality, will never be found in the Indonesian discourse suitable for class rank in the graphic Fry. For temunya point must exist in shaded areas. Therefore, in adding one more step is to multiply the number of syllables in figure 0.6.

RESULTS AND DISCUSSION

result

This research uses descriptive quantitative approach and diversified library research. The analysis in this study took a sample in which discourse has 100 words. The results of the analysis legibility folklore book "Ancestors Kamanippah Enggano" measurement procedure using graphs Fry formula, namely:

First Hundred Words

Very sunny days. The sun shone quite hot. Clear blue sparkling sea. Grains of white sand called waves. The sound of waves shouted with sea gulls in the air. However, a group of people can not enjoy the beauty of it. They were busy cutting down the palm trees, mangroves and coconut. They did not cut down arbitrarily. Only trees that were old enough and strong they choose. The trees have been felled cleaned fronds or branches. Once clean, the timber is dragged trooped to the beach. Sawn-logs that they tie together. They used ropes made of bark. It looks like they intend to make a raft. Raft which had been so stacked into two layers and

Result analysis:

Word count: 100 words

Number of syllables: $245 \times 0.6 = 147$

Number sentence: $14 + \frac{9}{13} = 14,69$

Mid Hundred Words

We had gone into the forests. Has also we are driving ravines, but there also we found the presence of our brothers, "he reported. Hearts chairman sad. "I'm so grateful for your hard work, Bujang. Do you really want me to believe that our brothers are gone, together with the Great Spirit. However, my heart is another want to make sure first that they do not exist on this island. "

The chairman paused and then asked,

"Tell me, Bujang, will there still be a place that you have not attended?"

"The only place we have yet to explore are the Mount Ekohe Nanuuwa, my lord," said the boy was. The chairman looked at Bukit Ekohe Nanuuwa Area

Result analysis:

Word count: 100 words

Number of syllables: $240 \times 0.6 = 144$

Number sentence: $8 + \frac{7}{10} = 8,7$

Last Words hundred

Kaahoa, Kaitora, and Kaarubi. They're starting a community in the Gulf Kinen. Because there are only four of them were on the island, Kamanippah and married three women. They live a happy and prosperous in the Gulf Kinen together their large family. Children who are born are named according to their mother's name. If he is the son of Kaahoa, he will be called back Kaahoa. Likewise, the rules for children Kaitora and Kaarubi. Their children and grandchildren we know as the Enggano today. They continue to grow. Until now become five indigenous groups, namely Kaahoa, Kaitora, Kaarubi, Kauno, and Kaaruba. That is the story of their ancestors Enggano.

Result analysis:

Word count: 100 words

Number of syllables: $247 \times 0.6 = 148.2$

Number sentence: $10 + \frac{4}{12} = 10,3$

Tabel 1. The result of the calculation of sentences and syllables in the story.

No.	Paragraphs in the page	Total Syllabics per 100 words	Number of sentencesper 100 words
1.	First page	$245 \times 0.6 = 147$	$14 + \frac{9}{13} = 14,69$
2.	Middle page	$240 \times 0.6 = 144$	$8 + \frac{7}{10} = 8,7$
3.	Last page	$247 \times 0.6 = 148.2$	$10 + \frac{4}{12} = 10,3$
Total		33.69	439.2
Average value		11.23	146.4

If taken into account through the fry chart table can be seen in the following figure:

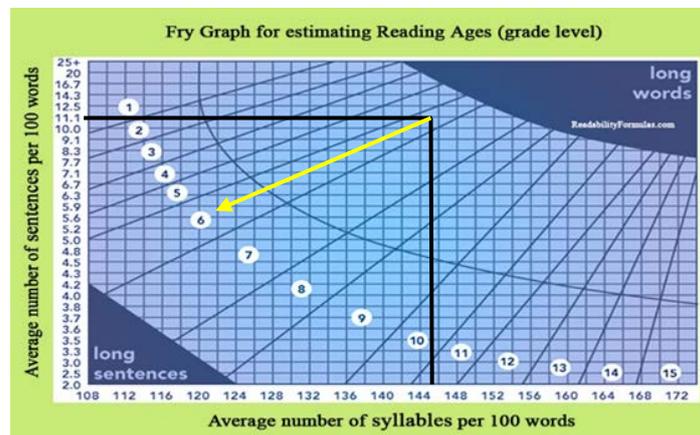

Figure 2. The results of calculations using charts fry.

The analysis result legibility by pulling both ranges in fry graph shows that the story entitled "Ancestors Kamanippah Enggano" is in level 6, where the value of the average number of sentences per 100 words is 146.4 and for the value of the average number of syllables of per 100 words is 11.23. The story thus suitable reading for students in grades 5, 6 and 7.

Discussion

From the calculation of the number of sentences and the number of syllables in the above, according to the story Kamanippah chart fry Ancestors Enggano, suitable as a reading material at the level VI. However, the result is still a chart fry estimate or range, so that the readability level still can be read on one level below or the level above it. For example, the story "Kamanippah Enggano Ancestors", suitable as a reading material at a level VI then the range underneath is $6-1 = 5$ which is suitable reading material read by the class V.

Then, the above range is $6 + 1 = 7$ which is suitable reading material is also read by the class VII. So, the story of Ancestors Enggano Kamanippah very suitable as reading material for class V, VI, and VII.

From the aspect of the use of the word, high readability in Indonesian language text if the text is presented with monosyllabic words simple and that has to do with the social context of student life (Suherli, et al., 2006).

Selection can be done by measuring the level of legibility. One of the easiest ways to measure the level of readability is to use readability formulas. Therefore, it is recommended to teachers to always test the readability of reading material with readability formula that had existed before ascertained as teaching materials for primary school children.

To improve the quality of the use of Indonesian, especially the aspect of legibility of text books, the author or publisher is advisable to always consider the vocabulary and sentences in the text book. In this case, the teacher can utilize readability formula as a tool.

CONCLUSION

Based on the results of the discussion, it can be concluded as follows:

- 1) Of the three paragraphs were taken starting from the beginning of the story, middle and last 100 words of the book and then look for the number of syllables and the number of parts requires using measurement calculation chart fry. Where the average value of both of these calculations that the number of sentences per 100 words is 146.4 and the number of syllables per 100 words is 11.23.
- 2) Use of the results of calculations using charts fry can know the contents of the reading is suitable for 5 and 6 grades for primary school and 7th grade for junior high school.
- 3) From reading books such as this can improve the communication of children, especially primary school children, can recognize some of the cultures that exist in Indonesia and learn the attitude of the character and how to emulate the figure in the book.

THANK-YOU NOTE

With gratitude to Allah SWT finally the author completed the task to keep a journal in which this task is the task of analyzing the book folklore entitled "Kamanippah Ancestors Enggano" and for the thoroughness of the results of final exams in courses Concept Indonesian elementary school at the State University of Surabaya (UNESA) majoring in Elementary Education Degree in 2017, which is taught by Mrs. Prof. Dr. Kisyani Laksono, M. Hum and do not forget also to all colleagues who have given their time and enthusiasm to do the work of up authors to finish well and correctly.

The effect of games on grade 10th students' motivation in English class at Tran Hung Dao high school

Le Thi Bay*

*Tran Hung Dao high School, Quang Ninh Province, Vietnam

DOI: 10.29322/IJSRP.9.08.2019.p9269

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9269>

Abstract- This paper aims at investigating the effect of games on grade 10th students' motivation in English class at Tran Hung Dao high school, Quang Ninh province and seeks to determine the extent to which using games in learning process affects the improvement in students' motivation in learning process, how students experience the teacher's practice and behavior and measure the students' perceptions of the using games in learning environment with respect to its effectiveness. Questionnaire, observation and structured interview were used as the main tools to collect data. Both quantitative and qualitative data analysis methods were used to provide enough data for the present study. The results from the data revealed that the using games in learning process significantly affected students' motivation in language classes. In addition, most of the students involved in the study are generally happy about using language games in their study and they recognize the benefits of the language games in enhancing interaction between them and their classmates as well as their teacher

Index Terms- language games, high school students, motivation, attitudes, performance.

I. INTRODUCTION

In the current globalization and integration trend, English is considered to be the most widely used language in the world, as nearly 60 countries use English as their primary language, their mother tongue, and nearly 100 countries use English as second-language English. Therefore, this foreign language plays a very important role in the current integration of globalization.

The demand for training and development of foreign languages, especially English in Vietnam is increasingly focused and enhanced. However, at present, although the focus on foreign language training at the school level, the results have not yet reached the required standards. The objectives set out in the project "Teaching and learning foreign languages in the national education system for the period of 2008 - 2020" have created a strong impetus in teaching and learning foreign languages; However, from the objective to the actual results of the project, the distance is very far. On November 16, 2016, Mr. Phung Xuan Nha - Minister of Education and Training announced that "the government had failed to meet the goals of the NFL scheme for the 2008-2020 periods" (VN, 2016). Limited English proficiency results in loss of the opportunity to study and work for many students.

So as to learn a language well, students demand a relaxed atmosphere that increases motivating and this can be gained through games. Using games in teaching not only helps students to learn better but also increase students' motivation, rapport, cooperation and social interaction. On the one hand, playing games helped the students get ability for language, this good language ability helps students be self-confident and express themselves in their future life.

The game is very useful to improve motivation among shy students who cannot express their feelings or thoughts in front of others. By using the game, students can be more active, self-reliant and energetic to study about the environment, the world they live in, and take part in the teaching and learning process. We can teach all skills and components through game play, based on a learner-centered approach, while we are teaching; we must pay attention to the meaning, relevance and level of learners (Widodo, 2006)

At Tran Hung Dao High School, students live mainly in mountainous areas, with difficult conditions, their English communication environment is not available, and having a few chances to access learning languages resources as well as opportunities to communicate in foreign languages. Most students who have moderate level of learning, limited access to learning and access to outside knowledge, lack of opportunity to practice communication, Besides, being a foreign language teacher, the researcher have been step by step innovating, integrating and diversifying teaching methods into teaching periods in my classes to create the most comfortable atmosphere as possible for students to access the foreign language what they are learning best

Adding that, teaching English in most of Vietnam public schools often only focuses on tasks and exercises in the textbook, lack of many important activities, such as: active discovery, analysis, interpretation, problem-solving, memory, and physical activities, which leads to the boredom and be difficult for motivating students in learning foreign language. Hence in order to improve the teaching English in the classes more and more efficiently, as well as overcome these weaknesses, that is reason the researcher conduct the research "The effect of games on grade 10th students' motivation in English language class at Tran Hung Dao high school". And this research was implemented at Tran Hung Dao High School, Quang Ninh Province.

II. LITERATURE REVIEW

1. Definition of Games.

According to Martinson and Sauman (2008, p. 478), "Games are effective tools for learning because they offer students a

hypothetical environment in which they can explore alternative decisions without the risk of failure. Thought and action are combined into purposeful behavior to gain a goal. Playing games teaches students how to strategize, to consider alternatives, and to think flexibly". In other words, games are fun activities that help promote thinking, learning, interacting and solving problem. Normally, games have an aspect that permits the players to produce information in a short time period. Some games require the players to participate in a physical activity or complete a mental challenge.

However, Lengelling and Malarcher (1997) say that choosing a game is not easy task, it should be governed by some rules to guarantee the success of them. So, while planning games, teachers should take into consideration the following features: Classroom space, noise, materials necessary for the game, the amount of time needed for each game, and the level, culture, interest and age of students.

2. Educational Games

Like computer games or online games but these educational games focus on playing in the classrooms, and our definition maintains that such games require the involvement of rules, competition, relaxation and learning. A major purpose for using games in class is to promote students' motivation in learning English.

Prensky (2006 and 2011) defined educational games as interactive plays that teach us goals, rules, adaptation, problem solving, interaction, all represented as a story. They give us the fundamental needs of learning by providing - enjoyment, passionate involvement, structure, motivation, ego gratification, adrenaline, creativity, social interaction and emotion.

3. Games in English language teaching.

Games are useful for students involved in the learning of English since games can strengthen students' motivation and self-confidence. Using games in English teaching process to raise students' motivation and confidence which can then promote higher levels of English learning process. By using a game which helps students lots of opportunities to do, to act, and to move, they can acquire a greater quantity of meaningful lesson.

Foreman (2003, p.16) states that "Learning through performance requires active discovery, analysis, interpretation, problem-solving, memory, and physical activity and extensive cognitive processing". In other words, games provide a constructivist classroom environment where students and their learning are central, from there, students draw their own meaning from these experiences while learning from their mistakes and also from each other.

In other words, games stimulate students' activities in classroom and as a result, students become motivated and willing to learn. Philips (1993) supports this opinion by her statement that enjoyable activity is memorable then and the possible success that the children could reach in language learning will develop motivation for their further learning.

Games allow for creativity, independence and higher thinking. Usually, questions made by the classroom teacher are fact based and have only one answer, not allowing for creativity, personal expression. The answer is either right or wrong, but games can allow for multiple answers. They improve participation, self-confident, and vocabulary usage and moreover, games allow the students to see that there are many ways to solve the same problem. It is more like real life.

In short, the use of games has great pedagogical value in enhancing students' motivation and can be a springboard for teamwork. In a classroom based on teaching through games, there are different types of motivated interactions that make teaching-learning process enjoyable in learners-learners, learners and teachers' interactions.

4. Motivation

Gardner (1985) said that motivation is perceived as a goal-directed factor since it involves four aspects: a goal, effortful behavior, a desire to reach the goal, and favorable attitudes toward an activity. Motivation works as the starting point for learning and supporting the process of foreign language learning. In fact, if there is lack of motivation, no student will be able to continue with the process of achieving language proficiency; in the other word, high motivation will be useful for learners to attain proper proficiency in the second language, even if their ability or learning conditions are not appropriate (Cheng & Dörnyei, 2007). Motivation has been admitted as a remarkable factor in language learning success. Motivation research has evolved over the years through several stages demonstrating gradual integration with developments in motivational psychology, while having a clear focus on aspects of motivation related to language learning (Ushioda & Dörnyei, 2012).

Harmer (2002) said that motivation is a type of initiative that encourages someone to do things to reach a goal. Moreover, this is fundamental to succeed in most fields of learning; without such motivation, we will not be able to make the effort to learn. So, it is necessary to understand the its role when learning a language. The author distinguishes between extrinsic and intrinsic motivation coming from outside and inside the individual respectively.

Research has admitted intrinsic motivation as a decisive factor to stimulate success. Furthermore, in a model of intrinsic motivation proposed by Vallerand (1997), he found that intrinsic motivation is related to knowledge, accomplishment, and stimulation. These three aspects are respectively associated with exploring new ideas and developing knowledge, sensations embraced in attempting to master a task or achieve a goal, and sensations stimulated by performing the task. This kind of motivation is referred to as extrinsic motivation, the motivation that students bring into the classroom from outside (Harmer, 2007).

According to Thomas (2004), Robbins and Timothy (2007). "Motivation is the driving force by which humans achieve their goals. Motivation is said to be intrinsic or extrinsic. The term is generally used for humans but it can also be used to describe the causes for animal behavior as well". This study refers to human motivation. According to various theories, motivation may be rooted in a basic need to minimize physical pain and maximize pleasure, or it may include specific needs such as eating and resting, or a desired object, goal, state of being, ideal, or it may be attributed to less-apparent reasons such as altruism, selfishness, morality, or avoiding mortality. Conceptually, motivation should not be confused with either volition or optimism. Motivation is related to, but distinct from emotion.

However, in order to understand of terms used in this study, the following definitions are given to research.

The students' motivation is the desire to attend and learn the contents of the subject or the study program, which is the decision-making process of students on the orientation, concentration and

efforts of students in the study process. Learning motivation increases the knowledge and skills acquired by students in the learning process. This is reflected in their academic results. Students will not be able to get the best learning results if they do not have the right learning attitude. Learning attitude, in which motivation is the deciding factor.

5. Previous studies

Although there has been much research in the field of motivation, some studies have emphasized the impact of using games on English foreign language learners' motivation.

AlHaj (2011) conducted research to explore and solve a motivational problem in English foreign language Sudanese secondary students. The author used previous studies, direct observations, and guided interviews so as to obtain valuable information. The results showed that the lack of motivation in English foreign language classrooms within the study was due to the following factors: teachers and their training, schools, families and the lack of developing programs which maintain students' interest in learning process.

Additionally, it was found that a variety of classroom activities play an essential part in motivating students and facilitating the acquisition of English foreign language. Thus, it is recommended that teachers use debates, games, group work, pair-work, interviewing, problem-solving and role-plays to stimulate or motivate English foreign language learners.

In Tuan's (2012) study, key motivational factors which were influencing students' English learning performance and some effective ways of fostering these factors were analyzed. The aim of the research was to find out whether motivation had any impact on students' English learning process. Results showed that 94% of the participants agreed that motivational activities are necessary. Students love playing games, reading, translation, group or pair work, role-plays, and including television for watching films in English and cassettes for listening.

Chou (2014) examined the extent to which activities such as games, songs, and stories helped and motivated 72 Taiwanese English foreign language primary school pupils (between the ages of 8 and 11) to learn English vocabulary. The instruments used to collect qualitative and quantitative data were self-assessment questionnaires, achievement tests, and interviews. The information collected was analyzed using statistics software. The qualitative data was coded, classified and reported according to their similarities and differences. The results demonstrated that games, songs, and stories had a positive effect on learners' motivation to increase their English vocabulary.

Kamra, (2010) concluded that using games is an efficient way to teach English in the classroom. This way you get the best results in the classroom. It arouses students' motivation. Games prepare young learners for life and they acquire positive social attitudes. Games teach sharing, helping each other and working as a team. A child learns by doing, living, trying and imitating. So this kind of learning is lasting. During games some feelings such as the pleasure of winning and the ambition of losing may arise. This gives to the teacher an idea about student's character. So games are must-have activities for hardworking teachers. This is in the line with Buckingham (2003)

In conclusion, Prensky (2011) argued that students are naturally motivated to play games. Serious games are interactive play that teach students goals, rules, adaptation, problem solving,

interaction, all represented as a story. They give them the fundamental needs of learning by providing enjoyment, passionate involvement, structure, motivation, ego gratification, adrenaline, creativity, social interaction and emotion. "Playing has a deep biological, evolutionarily important, function, which has to be done specifically with learning." (Prensky, 2011, p. 134).

III. RESEARCH METHODOLOGY

1. 1. Research design

Action research is adopted as the research approach to answer the two research questions and achieve the aim and objectives of the study. According to Ferrance (2000), action research is a suitable method for teachers who want to make appropriate changes to student learning and measure the possible effects, and he demonstrates "Action research is used to chart the effects of implementation of a curriculum or strategy, to study student learning and responses." This method is also justified to offer significant benefits for the researcher, who is also a teacher.

2. Participants

The participants included 38 students in class 10A1, there were 20 females and 18 males and all of them are at the ages of fifteen at Tran Hung Dao high school. Most of them come from mountainous areas not have many opportunities to learn English. Their parents are mostly farmers, their living condition is quite low, their parents only pay attention to earning a living in order to support their living condition as well as caring their children, they have no time to take care of their children's learning.

3. Research questions

1. What is the impact of using games on grade 10th students' motivation in Tran Hung Dao high school?
2. How are the students' attitudes towards using games in the English foreign language classroom?

4. Instruments

* Questionnaire

In this study, the questionnaire which consists of six items were designed and delivered to all students. This questionnaire was designed in a five point Likert-scale which descend the meaning respectively from strongly agree, agree, neutral, disagree to strongly disagree. This model is helpful to figure out students' reaction, attitude, and opinion toward the educational games applied during the treatment time. All of the questions were written in English then translated into Vietnamese to make sure students understand all the items in the questionnaire.

Each question was designed to serve different purpose. To be specific, the 1st item aims to explore students' perception on the important of game in learning English, the 2nd item is to explore students' opinion on using games in teaching English to apply in real context conversation, the 3rd items aims at exploring students' understanding of the lesson when learning with games. Item 4 explores the students' perception on the effectiveness of language games, item 5 explores students' opinion and interaction when learning English with games. The last items deal with students' motivation when learning English with games.

* Observation

Observation was another method used to collect data in this study. Two teachers from the researcher's English division was invited to observe the teaching and learning process. The observers used an available observation form to take notes. In this study, the observation sheet was designed to explore the class atmosphere

and student's ability to speak English when applying language games in learning and teaching. Observers used the observation sheet to tick and check where appropriate with the actual situations in the class.

** Structured interview*

In additional to questionnaire and observation, the interview was conducted to explore students' feelings and opinions in using language games in teaching and learning English. Five students were randomly chosen from class 10A1 to answer the questions. All questions were in Vietnamese so that all students can best express their ideas. Each interview lasted 2 to 3 minutes and all the interviews were noted with the aim to explore the attitude of students to games with hope to show how enjoyable students were with the games and how well students were involved in the lessons. The information was used to reinforce one of the aspects of research questions mentioned above. Like using questionnaire, applying interview also has certain drawback. Some students followed the crowd and they do not express their own feeling because they probably think that their answers can affect their marks in class. Therefore, the researcher met them in person to avoid those negative effects.

4. Data collection and data analysis

The action research was conducted in two months in class 10A1 at Tran Hung Dao high school. Class 10A1 was taught with the implementation of language games integrated when learning language skills. When teaching in 10A1, after students learnt with games, they were asked to use the language they had learned in the game. For example, in one of the students play on a situation and context. Then, they were asked to use it in front of the class. It has much interest when they were divided into several groups and each group was responsible for role playing a specific part. Actually, each week students have 3 periods (45 minutes each) of English. In week 1 and week 2 of the second semester (school year of 2018-2019), there were 2 observations with 2 lessons without language games. In week 6 and week 8, two lessons with language games were observed to have data of students' participation and speaking time during the lesson.

At the end of week 8, questionnaires were delivered to all 38 students in class 10A1. Students were asked to write their responses to the items and then submit to the researcher.

Structured interviews were implemented in week 9 of the semester to gain data of students' feeling and opinions on using language games in studying English for the present study.

The data was categorized this way simply for seeking answers to research questions raised for this study. The quantitative data from questionnaire and classroom observation were collected, analyzed and classified to synthesize in the table statistics. The results were shown in the figures and charts. The data from the structured interview were counted and presented by quoting relevant responses from the respondents

IV. FINDINGS

1. Results of questionnaire.

From students' responses for the 1st item in the questionnaire, most of the students (64%) strongly agree and 4% of the students agree that games play an important role when learning English while 20% of the students think it is neutral, only (12%) of the students disagree and no student strongly disagrees with this statement. It is clear that students realize how essential of using

games in learning English process, they may find it an inseparable activity in the classroom.

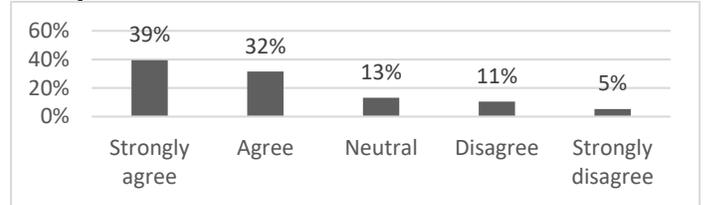

Chart 1: Students' ideas of the importance of using games in English learning process.

Additionally, students can use English in real contexts by studying through games, but it does not at the same rate. In fact, 39% of participants strongly agree that there are more chances for them to use games in real life situations while 32% of the students agree that they are able to apply games when they join in English learning process. 16% of the respondents cannot use the games in their learning process and the number of students answer neutral is 13%. This means that most of students recognize the purpose of using games is not only for creating excitement but also for providing students opportunity to speak out in class. The data are shown as following:

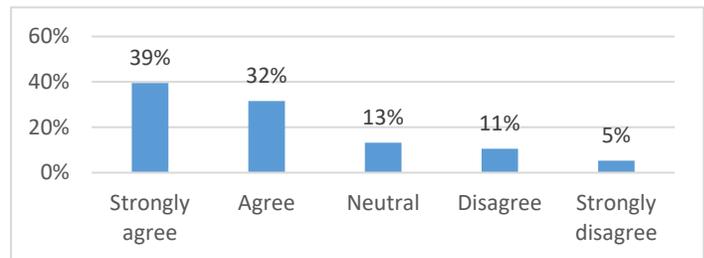

Chart 2: Students' opinion of using games in real contexts.

After English lessons, 74% students agree they can understand and practice lessons in class better through games, while 14% of the students responded that they were not able to understand and practice the lessons, 11% of the students answered they had no ideas. These figures confirm that the understanding of students is high and they really involve and understand in learning languages.

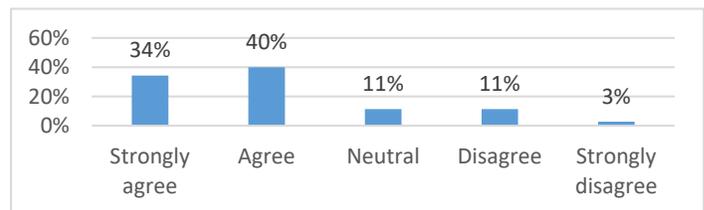

Chart 3: Students' understanding of the lesson

In exploring students' attitude towards using language games in teaching English, 27% of the students strongly agree that teacher's teaching method is effective and useful, 57% of the students agree with the idea and only 11% of the students disagree and strongly disagree with this statements. This indicates that most students like their teacher's new way of applying games in teaching process. As a result, they can be better in learning English and achieving their target.

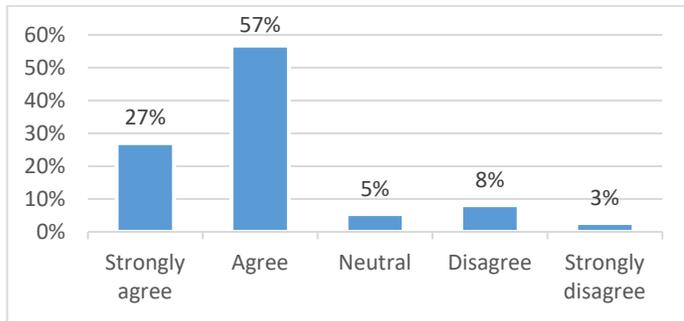

Chart 4: Students' attitude towards teaching method

Besides, the frequency of interaction among students-students and students-teacher through games is highlighted 18% of the students strongly agree that they use more English in their communication with their classmates and their teacher than learning English without games. 53% of the students agree they are able to interact with other students as well as with teacher. 13% of students say it is neutral and 16% of students disagree and strongly disagree with this idea. The data are presented in the following chart:

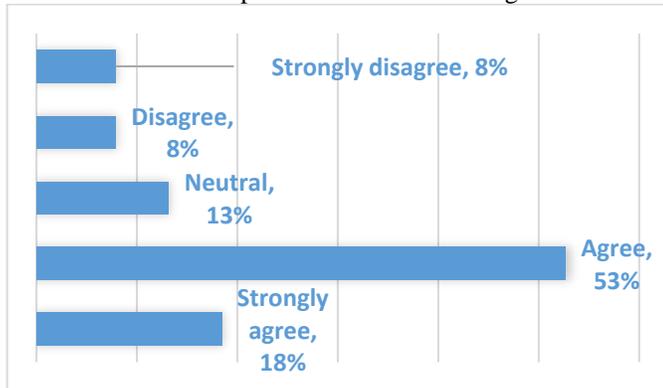

Chart 5: Students' interaction in English lessons

In Chart 6 below, it is clear that students had motivation when learning English with games since 97% of the students agreed that using games in learning English create strong motivation to practice English in class. Only 1 student (3%) did not agree with this idea.

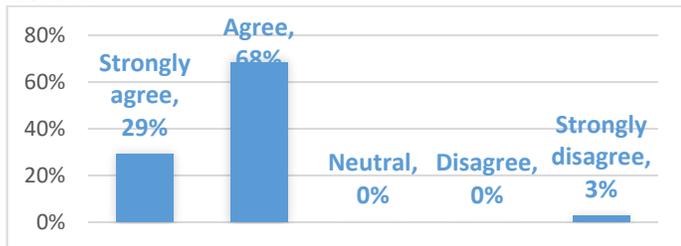

Chart 6: Students' motivation in learning English with language games

In sum, the above findings show that using games in teaching process can create strong motivation for students to practice English as well as provide real life situations so that students are able to apply what they studied to interact between students-teacher and students -students in class and outside class. This is a very positive outcome, particularly in light of the association between students' motivation and learning success.

2 Results of observation

When comparing these lessons with those using games, students had less chance to communicate and exchange ideas with others: about 48% for students spent too much time to do exercises.

Moreover, here the atmosphere was quiet and sometimes nervous but not funny and exciting. From the observation, students were tired at the end of the lesson. In fact, competition rate was about 30% because do not compete to answer teacher's questions. Furthermore, students' motivation was identified through the atmosphere inside classroom and students' English speaking time. Needless to say, two lessons using games create active and lively learning environment and students had more chances to speak English than the ones without games.

Comparison of students' motivation through lessons.

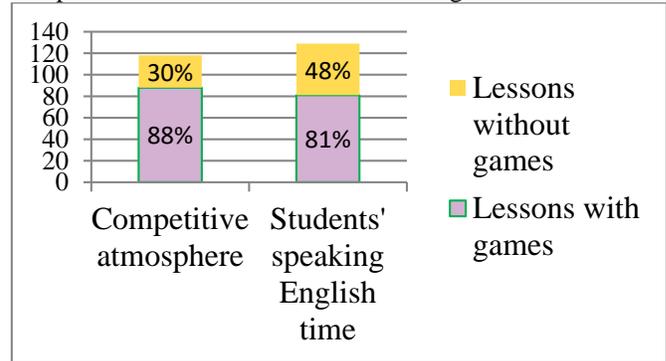

Chart 7: Comparison of students' motivation through lessons.

To sum up, findings of observation show that games seem to be relevant for students thanks to the extreme students' English speaking time as well as the collaborative learning. As a result, students can be successful in applying what they studied to real contexts.

3 Results of semi-structured interview.

The information collected from the interview, students' motivation is clarified through their feedback as well as suggestion in lessons and emotion to those games used in class. After the interviews with six students, the results are presented as below.

Question 1. Do you enjoy the games instructed by teacher?

All 6 students when interviewed responded that they "feel really exciting when studying with games" and they eagerly took part in more games and attempt to win these games. S1 said that he "enjoyed the non- stressful atmosphere, high motivation, as well as positive competition inside the classroom which is created by games". In fact, the students try to win because they receive the small gifts once they are winners. Sometimes, it is a lovely pencil, a small notebook or even lollipop or candy but these presents stimulate students to win the games as S4 said "it's lovely". S6 added "I can understand the games instructed by the teacher that made me enjoyed learning English". However, S3 made the researcher keep in mind when instructing games in class "I do not know how to play at first, so it is better to observe my classmate".

Question 2. Are you able to use new language when joining the games?

Most of the students said that they were able to use new structures when joining the games. S1 eagerly told the researcher that "I am sure I can use those structures immediately" or "why not, it's easy to practice with my friends when I am happy", said by S2. S5 added "I find it easier when speaking without pressure". Only 1 students found that it was difficult for him when he joined grammar game as he said "I need more time to think about the form to go to board and finish the game" (S4).

Question 3. Do you have more opportunities to communicate through game?

Five out of six questioned students said that they had more opportunities to communicate when joining the games. Data from observation also recorded about two third of the students often take part in the games positively. S2 said that “I have more opportunities to speak out what teacher instruct when they play the games”. S3 added “sometimes, I could not do finish the conversation but my friends forced me to finish to win the game”. S5 also explained “how could I shut my mouth when my friends kept asking me to speak”. S6 affirmed “even me, I have to speak”. However, S4 confessed “I am not good at English, even my teacher encouraged me but I think it’s difficult to speak”.

Question 4. Do you have stronger motivation when studying English with games?

When asking about motivation after studying English with games, S1 said that he “feel really interesting to learn English through the games, English is not too difficult as I thought”. S2 agreed “I think I am pretty good at playing language games”. S3 added “While I was working on the task I was thinking about how much I enjoyed the candy”. S4 believed he could do better when he said “I am suddenly stupid when everything was already clear at that time, I will do much better next time”. The similar statements were also expressed by S5 and S6.

Question 5: Are there any obstacles as you participate in the games?

Despite the fact that games bring many benefits, some students have unavoidable problems when they join the games. Most of the students said that there were not any obstacles as participating in the games, however, some minor difficulties when playing language games experienced by the students were: “I had wrong partners, they did not want to perform”, stated by S1 or “I had to run back and forth, because my friends were lazy. It was tired” mentioned by S2 or “teachers should give more time for us to prepare” (S3). S5 and S6 agreed that they need more time to be ready for the game. Only S6 had his own difficulty as he said “It’s fun but it’s difficult for me”.

In general, games or game like activities encourage most of the students positively to involve in lessons which can be seen through their motivation when playing games. Students feel confident and they are able to communicate better at the end comparing to those who are in traditional class. Although Translation Methods still affects the way students learn English, a good sign is that after the games students express their enjoyment as well as they think that games are beneficial for applying language features in their communication

V. CONCLUSION

This paper clarified the strong points of using games for students at Tran Hung Dao high school. The results from this action research expressed the positive influences of games on students’ motivation. Three kinds of datasets consisting of questionnaire, observation, and interview which showed an attempt to answer the two research questions posed at the beginning of the study and gave researcher evidence-based judgments to the innovation. They have promoted the trend of adopting games in teaching process for students at Tran Hung Dao high school. The using games in learning process offers to the students was successful due to a combination of factors. In addition, the games tasks were enjoyable, which increased their motivation to learn and gave them higher confidence in persisting with more challenging tasks.

Vitally important, pertinent games and activities should be examined to identify the most relevant ones for studying English. The upcoming study of using games in teaching process could be continuously investigated in different high school of Vietnam. Therefore, the collected information is more valid and reliable.

Games play an important role in teaching and learning process as well as they promote students’ motivation. The data was collected from the questionnaire, observation and interview were analyzed quantitatively and qualitatively. The data analysis helped the researcher achieve the aims of the study.

Major findings of the thesis, from the thorough analysis and discussions of the data collected from the survey questionnaires and score analysis, significant findings were identified.

Firstly, it was discovered that using games in teaching and learning process did have positive effects on the students’ motivation. Games provide comprehensible input while learners interact in the group and allowing students to clarify the ways of learning new languages. Implementing games in teaching also enhanced students’ motivation to learn English in class. The strategy also allows the students to interact effectively with peers, which is also used as student-centered method. The games also provided a challenge, where they need their concentration to get the tasks done which strengthen students’ mental work. Such activities were also new to students’ experience and they think carefully to get the right answers.

Secondly, from the questionnaires, it was found that most of students had positive view toward the implementation of using games in class. Most students liked learning through games it could improve students’ motivation. Last but not least, by implementing the games in the class students could improve their interest in learning process. The win as a drive to play a language game cannot be underestimated. It is the factor which allows a learning class environment to be conditioned and shaped according to the needs of the students, the learning process, or the requirements of a course.

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9270>

Abstract- The present investigation aims to investigate the factors that affect the teaching and learning processes of English teachers and learners at Thai Nguyen University. These factors were divided into two categories: socio-psychological (interest, personality family circumstances) and teaching situation (teachers and syllabus). Two sets of questionnaires were administered as the data collection instruments to gain enough data for the analysis. Results from both questionnaires show that social psychological factors influence the students' attitude and motivation towards learning the English language. Students hold positive self-concept manifested in rating themselves versus their ideal person. And both are reflected in the general low level of anxiety in the English classroom as reported by the students themselves. Parental support was reported as generally encouraging. In addition, attitudes towards English speaking people were fairly favorable though attitudes towards English culture were rather neutral. Teachers' attitudes towards their profession and towards the students' performance appear to be "good" and they are generally satisfied with their profession and its conditions. Teachers also showed their satisfaction with the syllabus and believed the goals, objectives and teaching methods could match the students' needs
Index Terms- Thai Nguyen University, attitude, motivation, English learning, English teaching.

I. INTRODUCTION

The construction of an educational system capable of preparing humanity to live productively and meaningfully in this shifting world is one of the most essential and critical responsibilities of a modern society (Griswold, 2008). In an increasingly globalized world, numerous factors have emphasis on foreign language learning as a part of educational practice has become particularly important.

A number of factors have been identified as influencing students' engagement with L2 learning. Characteristics of L2 learning such as cognitive and social aspects, individual learner differences, affective issues, motivation, learning styles and learning strategies have drawn much attention from researchers. Consequently, learner variables have become one of the most significant domains of research in second language acquisition (Van, 2008)

Learning is the most fundamental and most important activity for every student at universities and colleges, and this activity can only greatly benefit from motivation. According to Piaget (cited by Duy, 2009) motivation is all factors that work to meet the needs

and direction of the learning process. Motivation exists in two forms: internal motivation and external motivation. The inner motives are formed from the interest in learning to satisfy the need for understanding. External motivation is not created by the excitement of oneself in learning but the excitement resulting from learning (high scores, reward, punishment, to please someone...). Motivated people will actively participate in the learning process and have the independence in solving problems, like new things, new challenges. On the other hand, people with strong external motivation, when achieving their goals, tend to be less motivated and often fail to cope with failure, difficulties and complex tasks (Chi, 2007).

Besides, according to Curran & Rosen (2006) every courses in the curriculum, along with the is the leading factor that brings knowledge, understanding and skills to students. The content of the courses and the curriculum that is clear, practical and highly applied will promote the learning behavior of students who are trying to learn to accumulate knowledge and skills for the future. In Thai Nguyen university, all institutions have their own EFL programmes to cater for the needs of their students. The programmes ranged from the very basic to the most advanced, adapted to the varying proficiency levels of learners. In all universities (except the School of Foreign languages), the English competence of the students before entering university is different. In addition, English is not the tested in the entrance exam, students are not classified according to placement test to teach in group, the syllabus has not been systematically compiled, the number of students in a large English class. Those factors have been foreseen that affect the teaching and learning processes of teachers and learners at Thai Nguyen University. However, up to date, there has been no research conducted to explore factors affecting the teaching and learning process extensively. Therefore, this study's intention is to acquire as much information in these factors as possible. From the point of view of the language teachers, the more knowledge they accumulate, the more confident they become in creating a language learning environment that will maximise the gains experienced by the students.

II. LITERATURE REVIEW

1. English Language Learning.

Language learning is an active intelligent, rule-seeking, problem-solving process that develops through the construction and application of a system of rules. These rules allow the speaker to create innovative utterances never heard before. It would take too

long, the cognitivists argue, to learn language through a process of stimulus-response. Learners must understand and analyse grammar rules to develop their competence as a basis for performance. Its purpose is to enhance the same sorts of abilities that native speakers possess.

One of the main principles of the communicative approach was that language is learned best through the negotiation of meaning in task-based interaction with others. Communicative language teaching classroom procedures are usually composed of group activities, language games, and role plays; yet these activities and the ways in which they are used are not exclusive to communicative classrooms. Richards (2002) explained that the communicative approach may have survived into the new millennium because it refers to a diverse set of rather general and uncontroversial principles, and it can be interpreted in many different ways and used to support a wide variety of classroom procedures.

The communicative approach is not a single method; it is to a certain extent a point of reference that can be adapted to practically any method, including cognitive and acquisitionist. Due to its social structure the communicative approach is most closely related to sociocultural approaches (Collings, 2007).

2. Factors affecting language learning

* Family and parents

According to Terenzini, (1993), Engle, (2007), the change of L2 students often requires learning and adapting to new academic and social systems. Their challenges lie in the fact that these new academic and social systems are not part of their family and cultural traditions. Thus, adapting to new academic and social systems requires them to break away from their old traditions and cultural norms.

The parents who are involved in their children's school, tend to have fewer problems and better learning performance, and are more likely to complete high school than students whose parents are not involved in their school. Positive effects of parental involvement have been demonstrated at both the elementary and secondary levels across several studies, with the largest effects often occurring at the elementary level. Drake (2000) states, "Nowadays, family involvement has reached a new level of acceptance" (p. 34).

More explicitly, Wells (2008) said, social capital "includes the social and personal connections or networks that people capitalize on for interpersonal assistance and personal gain, which for youths are often developed in schools in addition to the home" (p. 29).

As a result, it can be said that socio economic status is necessary for successful foreign language learning and academic performance causes significant social, cultural, and academic success.

* Curriculum and Syllabus

Harris and Schaible (1997) stated that "anecdotal evidence suggests that both students and faculty members believe that students improve their writing and subject-area knowledge in writing across the curriculum-based courses" (p. 31). According to Harris and Schaible, "The overwhelming weight of current evidence suggests that LAC (learning across the curriculum) can improve both student comprehension of subject-specific knowledge and their writing, but only when it is consistently and rigorously applied" (Harris and Schaible, 2000, p. 37)

Rose (1985) cited "The way of talking about writing abilities and instruction is woven throughout discussion of program and curriculum development, course credit, instructional evaluation and resource allocation. And, in various ways, it keeps writing instruction at the periphery of the curriculum." (p. 341). Morris (1998) offered, "The content of curriculum in UK have been explained with reference to areas of learning or experience which is a combination of forms of knowledge and types of skills and attitudes of a culture that assists students in writing" (p.27).

It is clear that English learning is important. It is the poor English learning achievement that has called for attention to teaching and course design in order to improve the situation (Abbott, 1992). To achieve better English teaching and learning, the first possible issue to look at is the curriculum, as it is often the first thing on which learning objectives, teaching content, assessments and teaching methods are based, and it is a major factor affecting language learning outcomes.

Therefore, we can perceive that curriculum is an important influential factor to develop English language learning of students.

3. Attitudes and motivation in language learning

2.3.1 Attitudes and Motivation

Language aptitudes could be defined as "a set of cognitive or verbal abilities which appears to be related to second language achievement" (Gardner, 1985). This variable has always been combined with the attitudes and motivation variables to compare their relative effects on achievement. However, some researchers nowadays question the value of such concept as they see that all individuals acquire a first language, and have debated the issue of innateness or acquisition of a language.

Besides, "Attitudes and motivation" refer to a class of nonability variables presumed to be important in second language acquisition" (Gardner 1985, p.119). Some research dealt with a number of attitudinal and motivational measures and others with one attitudinal object. Almost all report a relationship between attitudinal variables and indices of second language achievement. In this study, the attitudinal/ motivational dimension includes attitudes towards learning a foreign language, towards learning English as a foreign language towards English culture and English speaking people, motivational intensity, daily political situation, attitude towards the English language course and teacher.

4. Factors affecting Attitudes and Motivation in language learning

Since attitudes and motivation influence second language learning, the factors that influence them could be exemplified in parental and teacher attitudes, community beliefs or cultural expectations, peer pressure, relevance of the course.... Most research so far has dealt with parental and teacher attitudes and their effects on student attitudinal/motivational characteristics.

Parents are believed to have a major role in their children's second/foreign language process. Gardner (1985) identifies two roles for the parents: active or passive. The first refers to the parents' conscious promotion of the children's language learning as they monitor their progress and praise their success. The latter may include encouraging and supervising the children's work but necessarily involves transmitting negative attitudes towards foreign language learning. This can be manifested openly through comments about speakers of the target language or the importance of language learning in the curriculum, or indirectly by showing apathy in the foreign language. Mao (2011) reported that parents who have positive attitudes towards French Canadians and who

are integratively oriented encourage their children to study French and as a result these children are skilled in French. Bain (2010) reported that children with ethnocentric tendencies have parents with similar attitudes. Gardner (2010) reported an association between the students' orientation and difficulty with cultural identification and their parents'. The only parental characteristics investigated in this research are the educational and occupational background and encouragement of English language learning as reported by the students themselves. As the latter is the subjects' perception of the parents' encouragement, it must be said that it may or may not conform to the parents' opinion; however, this perception is the students' reality in their practical learning process.

Likewise, teachers play a significant role in the foreign language teaching process. Teachers are expected to have some general characteristics, personal and professional, to be successful in their task. Personal characteristics are those pertaining to the teacher as a human being, that is, they have no relation to professional competence. Patience, tolerance, warmth, flexibility, sensitivity, open-mindedness, and self-confidence are the major characteristics a teacher has to have. Such qualities- Gu (2009) believes- are innate but could be brought to surface or enhanced. For the purpose of this research, one part of the students' questionnaire was designed to elicit information about how the students perceive their English language teacher; personally and professionally. Furthermore, the teachers' questionnaire involved some questions about the teachers' educational background, enthusiasm towards the teaching profession and relationship with students.

5. English language teaching in Thai Nguyen University

Thai Nguyen University (TNU) is located in the northern midland and mountainous region where many ethnic minorities live in harmony for a long tradition, in which ethnic minorities accounted for 24% - the highest rate in the country with their own cultural identities. At present, TNU has a current enrollment of 90,000 students, of which there are about 65,000 undergraduate (55,000 full-time and 10,000 part-time) and others are professional vocational students. The annual application average is from 70-80,000 applications from various parts of the country, mostly from 16 northern upland provinces of Vietnam.

Inn TNU, English is a compulsory subject across all programmes at different institutions (except the School of Foreign Languages, the International School and 5 advanced programs at TNUT and TUAF). Students study 10-12/120-132 credit hours, accounting for nearly 10% of the total credit hours of an undergraduate programme. Most of the students come from mountainous areas and there are no entrance exams or placement test. Most students understand from beginning of English course that they need to be good at English to be confident looking for jobs. However, apart from students with an English major, English was only taught in the first two years of university for a couple of hours a week. In all institutions within TNU, students who had already learnt three or seven years of English at school are still placed in a class with the students who had not learnt any English before entering university. Thus, they all learn English from the beginning with the same textbook and the same contents delivered in each lesson. In a mixed class of 30 to 40 students who have to relearn English feel bored, while the others feel nervous and lack confidence. Then, for the last few years at universities, English is no longer

taught in the curriculum, any student who wants to maintain and improve their English have to spend their money to improve their English in language centres outside universities.

III. RESEARCH METHODOLOGY

1. 1. Research design.

The present study will be quantitative research in nature. The data collected from two questionnaires of both students and teachers will provide quantitative data for the study. The data will be compared and contrasted to see the main factors affecting the language teaching and learning processes as well as the relationships (if any) among those factors.

2. Participants

* Students

Seven hundred and thirty students enrolled as regular students in 4 universities within Thai Nguyen University served as subjects for this study. The total of 730 students aging from 17 to 23 responded to the student questionnaire.

* Teachers

Seventy-eight English teachers from 9 institutions within Thai Nguyen University responded to the questionnaire for teachers. 11 of the teachers are males and 67 are females. Sixty-six teachers are M.A. degree holder and 12 Ph.D. All the teachers are full-time teachers at their institutions

3. Research questions

1. Which of the social and psychological factors influence the students' English language learning?
2. What are teachers' attitudes towards their profession and towards the teaching curriculum?

4. Instruments

* Students' Questionnaire

The questionnaire as used in this study consists of two main parts and 9 subsections aiming at eliciting descriptive information about students' gender, university, number of English language courses taken. Some of its basic ideas are adapted from the Attitude/Motivation Test Battery which is developed by Gardner and his associates to assess the non-linguistic aspects of second language learning. Changes-major and minor- as well as additions and subtractions to the original items were needed to assess the non-linguistic aspects of foreign language learning in TNU.

* Teachers' questionnaire

The teachers' questionnaire is constructed on similar lines to the students' questionnaire. Since the student and the teacher are the two important elements in the teaching/learning process, equal emphasis should be put on examining both of their views about this situation. The teachers' questionnaire is composed of three parts.

Part I asks about teachers' attitude towards the teaching profession. Part II asks about teachers' attitudes towards the teaching/learning situation and towards the students' performance in general and Part III asks about teachers' attitude towards the syllabus at their institutions.

4. Data collection and data analysis

After transferring the questionnaire into Google form and publish online, the researchers wrote an email to ask for help from teachers who are teaching English at 9 institutions within TNU. The teachers were then randomly assigned students in their classes whom they were teaching at that time to complete the questionnaire. After five months (from December 2018 to May

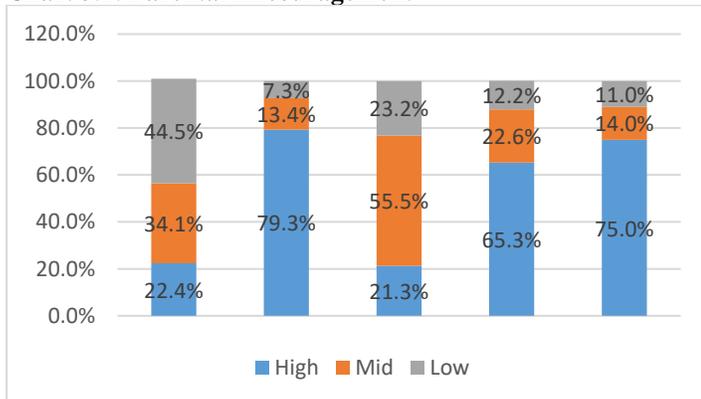

2019), 730 completed online questionnaires were collected and ready to provide data for the present study. The teachers' questionnaire was administered in similar procedure and 78 questionnaires forms were collected. Data collected from two sets of questionnaire was collected where frequencies and percentages are given, the ratings on the five-point scale items which appear in the questionnaire were reduced to three points: high, mid and low for ease of interpreting the results. The high rating was created by combining scales 4 and 5, and the low rating by combining scales 1 and 2; the mid rating represents scale 3: neutral. Besides, the high level represents "strongly agree" and "moderately agree", the mid-level "neutral", and the low level "moderately disagree" and "strongly disagree". The results were then presented in tables to see the correspondence

IV. FINDINGS

1. Results of questionnaire.

* Parental Encouragement

Chart 3.1: Parental Encouragement

In general, students reported positive attitudes of their parents towards the teaching/learning of English as a foreign language. The majority reported neutral responses as to whether parents think their children should spend more time on the English courses (55.5%). Besides, 44.5% students thought that their parents did not help them to learn English. The reason could be that either parents themselves are not proficient enough in English or it is not expected that parents offer help to their children at the university level.

* Interest in Foreign Languages

Chart 3.2 below states that students showed general positive interest in foreign languages. One of the four items indicating the level of interest in foreign languages which is a general statement concerning "the importance of learning foreign languages for the Vietnamese" received 90% high ratings. The other three items on the other hand, concerning the students' own use of foreign languages received lower percentages of ratings. The reason could be that they perceived 'the book' as a textbook related to their field of study, thus they feel a more urgent need to read it in the original language it was written in. Another reason could be the lack of local newspapers and magazines written in English; thus, students may not find equal interest as in reading about issues that concern them more directly found in newspapers and magazines.

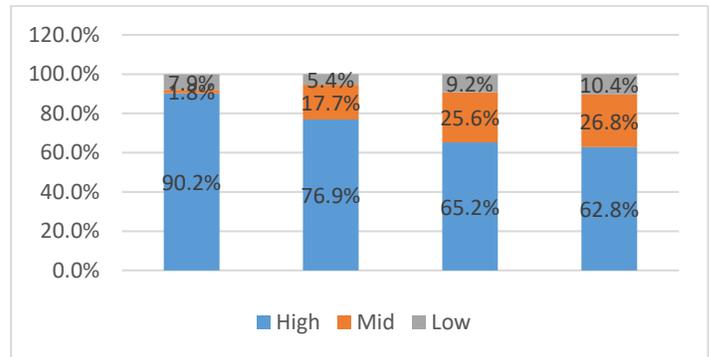

Chart 3.2: Students' Interest in Foreign Languages

* Instrumental Motivation

Chart 3.2 below shows students' instrumental motivation of TNU students. Two items (*studying English ... to meet and converse...* and *studying English ... make me more knowledge person*) indicated a very high level of instrumentality among the students. The first item could be considered a social one where other people are also involved, 'students could meet and converse with a variety of people'. The second could be labelled as personal, where students could be more knowledgeable. However, only 48% reported that studying English can be important because knowing a foreign language would make them more respected (item 3). Though this item can be considered both social and personal, it does not seem that knowing a foreign culture is associated with 'social respect'. One item (number two) which showed less instrumental motivation could be said to relate to ethnocentrism; "Studying English can be important because it will offer me a chance to leave the country" received 38% high ratings, 32% low ratings and 30% 'neutral'.

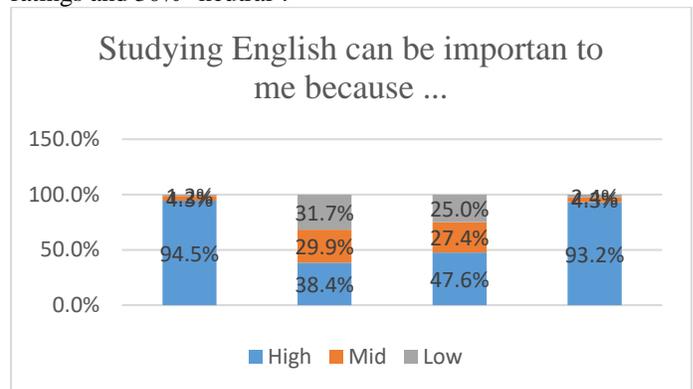

Chart 3.3: Students' instrumental motivation

* Attitude towards English Culture

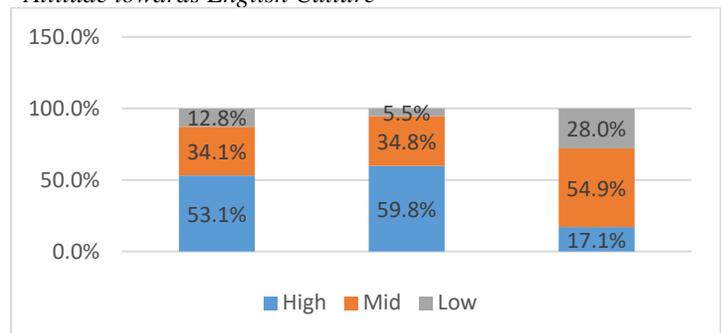

Chart 3.5 Attitude towards English Culture

An average of 56% of the students showed positive attitudes towards English speaking people, and English culture on two

items. However, the percentage of high ratings dropped to 17 concerning their directly stated attitudes towards English culture with 55% neutral responses, “... *I have discovered that some aspects of that culture are not as good as I had thought*”. That more students showed positive attitudes towards English speaking people and ‘artists and writers’, but more or less neutral attitudes towards the culture, tending toward low level- may be because ‘culture’ is more inclusive than individuals. That is, students may have a relatively negative attitude towards a culture which they believe has some effect, in one way or another, on their own culture or identity, whereas individuals of that foreign culture are not perceived as having direct influence. This may also be related to the students’ degree of ethnocentrism, where the higher the level of ethnocentrism is, the more negative their attitude towards the foreign culture is expected to be.

** Attitude towards Learning English*

In the questionnaire, there are 8 items aiming at exploring students’ attitude toward learning English as follows:

- Item 1: I plan to learn as much English as possible,
- Item 2: If I had the opportunity to see a play in English, I would definitely go.
- Item 3: English is an important part of the Lebanese educational system,
- Item 4: I would rather spend my time on courses other than English.
- Item 5: Learning English is a waste of time.
- Item 6: I am studying English only because it is a requirement.
- Item 7: If there were an English Club in the University dealing with English poetry, drama, books, cooking, movies..., I would attend meetings,
- Item 8: If I had the opportunity to speak English outside the classroom, I would do it.

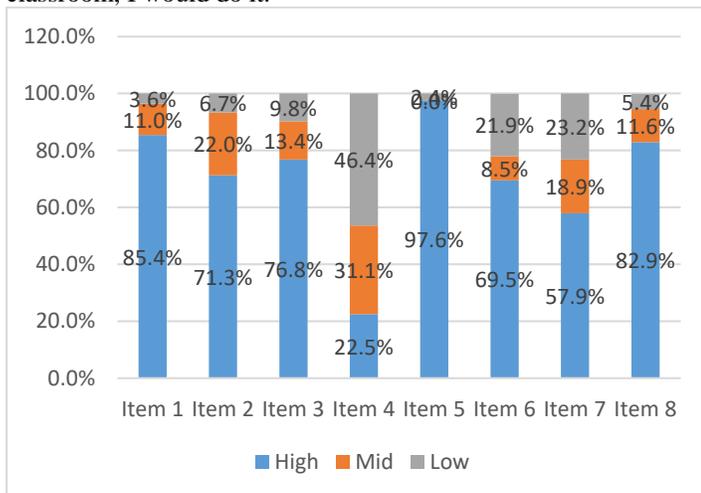

Chart 3.6 Attitude towards Learning English

Students’ attitudes towards learning English tended to be high on all items except one. The highest percentage of high ratings was for the following item: “*Learning English is a waste of time*”. Of the 730 students, 98% disagreed on this statement and none was neutral. This means that most students have a great value for learning English. An average of 84% reported they plan to learn English as much as possible and that they would speak it outside the classroom given the opportunity. However, only 76% agree that English is important in the Vietnamese curriculum. The item “*I am studying English only because it is a requirement*” received

70% high ratings and 22% low ratings. While 71% of the students would go to a play in English, 58% would join an English club at the university. The fact that the second item is related to the students’ lives at the university could explain the discrepancy in percentages, though relatively not too big. The interesting point here is that though the majority has positive attitudes towards ‘the learning of English’ (item numbers 5, 1, 8, 3, 2, 6 and 7 in order of high percentages), 46% show negative attitudes and 31% are neutral on one item: “*I would rather spend my time on courses other than English*”. The reason that only 23% showed positive attitude on this item can be that it is concerned with the language course- content, readings, assignments...- rather than the value of English or the general use of it.

2 Results from teachers’ questionnaire

**Attitude Towards the Teaching Profession*

The majority of teachers (59%) reported they had planned to teach English. Those who responded they were happy with their choice formed 86% and those who would not change their profession if they found a more suitable one were 68%.

More than half of the teachers (59%) do not find the teaching profession materially rewarding but 82% find it is socially. An average of 82% reported that teaching is enjoyable but tiring, and 64% find it satisfying. All of the teachers agreed that teaching is a ‘respectable’ profession.

Of the total teachers, 81% felt their interest in the profession has not decreased as years passed. About 73% do not feel satisfied if only a few students show progress. All teachers give extra assignments to help the students overcome their points of weakness.

In general, teachers seem to be quite happy with their jobs though more than half (an average of 59%) had not planned to teach and do not find the profession materially rewarding. This satisfaction seems to give them the incentive to carry on their duties and responsibilities such as maintaining their interest, wanting more students to progress and giving extra assignments.

Relationship with students

The two adjectives used most to describe the kind of relationship between teachers and students were ‘disciplined’ and ‘friendly’. The frequency of use of the six adjectives came in the following order: ‘friendly’ (67), ‘disciplined’ (54), ‘formal’ (38), ‘informal’ (3), ‘strict’ (30), and ‘permissive’ (16). From these figures, one could better understand the relationship between the two. Teachers would prefer to be ‘friendly’ but at the same time ‘disciplined’. This may be explained by the still prevailing belief among the Vietnamese: parents, teachers and students, that teachers are “the authority” in the classroom and that they have to be serene. While the terms ‘formal’ and ‘informal’ received equal number of frequency of usage, words such as ‘strict’ and ‘permissible’ tended to be rarely used probably because of the strong connotation each word carries.

Of the total number of teachers, 14% would ‘definitely’ make an attempt to know a little about the students’ background at the beginning of the semester and 41% would, only if they feel they should know more. The rest (46%) do not make any attempt at all. As to whether the teachers are willing to give extra time to help weak students, 86% reported they would if they find the student really needs help, and the rest (14%) would but not more than their assigned office hours.

Finally, while only 9% of the teachers remain optimistic and try to help students overcome their points of weakness, 64% find it difficult to maintain such a feeling. The decision of the rest (27%) depends on the general atmosphere of the class.

Teachers seem to be quite responsible and willing to help and instruct the students, and at the same time, realistic concerning their everyday, practical, professional chores. For the first two questions, teachers showed mild interest and responsibility towards students, that is, within their professional duties; however, they find it difficult to remain optimistic and try to help students, possibly because of factors relating to the general atmosphere of the university and/or country, and not necessarily for educational reasons

**Teachers' level of Satisfaction*

In general, teachers seemed satisfied with most of the teaching/learning aspects. However, the language laboratory, facilities offered by the university, and the outside opportunities the students have to practice English received relatively lower ratings of satisfaction. On the other hand, teachers seemed quite happy with the way they evaluate the students' achievement and their availability for consultation.

**Teachers' Attitudes Towards the Syllabus*

Of the total teachers, 63% reported that the aims of teaching English in TNU are known to themselves and to all teachers of English. Therefore, what they believe the aim of teaching English to university students should be is summarized in the following (the number in brackets after each phrase represents the number of times it was mentioned in the questionnaires), to help students:

- a. express their thoughts in any form- written or spoken (67)
- b. communicate with people (51)
- c. in their academic studies, undergraduate as well as graduate (40)
- d. in their profession (37)
- e. read, write, listen and speak in the foreign language (with different emphasis on the skills) (30), and
- f. know about the foreign people and culture (21).

Of the total number of teachers, 91% reported their departments have set goals for the teaching of English. Of these, 95% thought these goals match theirs, 80% believed they match the students' needs to learn English as a foreign language. However, only 40% had a say in setting these goals. About 90% reported their actual teaching matches the departmental goals and 75% felt students are aware of these goals.

Of the total teachers, 68% think students do feel the need to learn English. This was quite evident in the students' questionnaire where students reported the value of learning English in different instances. As to what kind of syllabus teachers have, 55% reported they follow a general one where they are given guidelines, but interpretation is left to them; 41% reported they follow a rigid one where they are given a day to day schedule. Only one respondent said he/she follows an open one where decisions about what and how to teach are left entirely to the teacher. All except one would like to have a general syllabus, which is justifiable by the fact that teachers do need to know what is expected of their teaching and at the same time can adapt that according to what may be more suitable and efficient in certain conditions.

Whether students should be consulted about the content and method of courses in sciences and mathematics, the majority of teachers (82%) expressed disagreement. However, as far as language courses are concerned, 50% of the teachers agreed. This

may be natural since the syllabi in the former type of course could be more precise with definite steps and clear guidelines to be followed.

V. CONCLUSION

Regarding social psychological factors influence the students' attitude and motivation towards learning the English language, it can be concluded that in general, students had a positive opinion of their proficiency in foreign languages- especially English, their performance in English language skills, as well as their frequency of using the skills. This is accompanied by the students' positive self-concept manifested in rating themselves versus their ideal person. And both are reflected in the general low level of anxiety in the English classroom as reported by the students themselves. Parental support was reported as generally encouraging.

Attitudes towards English speaking people were fairly favorable though attitudes towards English culture were rather neutral. However, nearly half of the students expressed interest in spending more time discussing the culture of English speaking people in the classroom. Students have a general satisfaction in the teaching/ learning situation. They believed that learning a foreign language does not endanger their cultural identity. This may be linked to their general interest in foreign languages as shown in the results "It is important for the Vietnamese to learn foreign languages" (90%). The value of learning English was also appreciated by the subjects; "Learning English is not a waste of time" (98%). This was also obvious in their desire that only English be spoken during the class. This is reflected in the subjects' relatively positive motivational intensity in the English language course, except for volunteering for extra assignments.

Regarding teachers' attitudes towards their profession and towards the students' performance, the second important figure in the teaching situation in this research, seem to be generally satisfied with their profession and its conditions; "it is socially rewarding" and "their interest has not decreased". Moreover, they are willing to exert extra effort when needed, and their relationship with the students appears to be "good". They showed the great effort on helping students not only to learn English but also to be a good citizen as the most frequent words appeared were "friendly" and "disciplined". In addition, English teachers at TNU also showed their satisfaction with the syllabus and believed the goals, objectives and teaching methods could match the students' needs.

Abstract- OBJECTIVE –The objectives of this study were to analyse clinico-pathological determinants of the clear cell and uterine pappillary serous cell carcinoma.

Material methods- A cohort of patients diagnosed and underwent complete surgical staging for upsc and clear cell of the endometrium from 2010- 2018 were viewed. The significance of the independent variables were calculated by chi-square. The multivariate regression analysis of the factors influencing the nodal status.

RESULTS- We could analyse that both clear cell and upsc, was prevalent in 61 yr age. They are associated with comorbidities. They present with a higher grade (G3), pre-op imaging, showed more number cases with et of 15 mm. The nodal status was significantly affected by myo-invasion > 50% lvs in clear cell carcinoma. Where as the lvs+, adnexa+, omentum+, peritoneal cytology+, myo-invasion > 50%, was significantly found associated with a positive nodal status in uterine pappillary serous cancer.

Index Terms- UPSC – uterine pappillary serous cell carcinoma, ET – endometrial thickness, Mmmt- malignant mixed muellerian tumor, LVSI - lymphovascular space invasion

I. INTRODUCTION

Clear cell carcinoma of the uterus is the rare subtype accounting for 1-6% of uterine cancers, is characterised histologically by clearing of cytoplasm (1). They present in higher stage. Comprehensive surgical staging is recommended in all clear cell carcinoma. Aggressive, multimodality of treatment (including surgery, chemotherapy, and/or radiation therapy), is recommended as compared to endometrioid carcinomas. Clear cell carcinomas are genetically distinct from endometrioid cancer. Clear cell tumors show similar gene expression profiles regardless of origin. (2)

- Uterine pappillary serous cancer is the most common prototype of type II endometrial cancer, which accounts for only 10% of all endometrial cancer but is responsible for 40% death in endometrial cancer (3). The most common symptom diagnosed in UPSC, as is for women with endometrial cancer, is postmenopausal bleeding. This is usually mixed with grade 3 endometrioid and

clear cell. UPSC tends to occur in older women. Increase risk is seen in African American women. UPSC is highly aggressive and more likely to be presenting in advanced stage III and IV. (4). Women, on tamoxifen for breast cancer, is at a risk of UPSC. Association between BRCA and UPSC, is evident in the emerging data. There is a precursor lesion for, but it may present late, at advanced stage. There are some similarities in serous ovarian cancer and UPSC such as tendency for peritoneal carcinomatosis, presenting with ascites, upper abdominal involvement and early lymph node involvement (5). The 5 yr survival for patients with UPSC has been reported from 18% to 27%, which is probably due to extra uterine spread in 60 - 70% of the patients at diagnosis (6).

- Although clear cell serous cancer constitutes less than 10% of the endometrial cancers, they account 50% of recurrences and disease related deaths. The most common presentation in clear cell carcinoma is postmenopausal bleeding. There is association of BRCA, ARID1A with clear cell cancer. There is increase frequency of clear cell, post radiation. (7) Diagnosis and work up endometrial biopsy, by pipelle has sensitivity of 99%. Ultrasound not reliable for UPSC (8)

II. MATERIAL- METHODS-

Inclusion criteria- 1. all cases of clear cell and upsc of the endometrium

- **Exclusion -** 1. all endometrioid
2. mmmt
3. sarcomas
4. cervical cancers

The clinical and pathological data were reviewed at AHRCC. All the specimens were evaluated by pathologists. The patients underwent the surgical staging, histopathology was analysed. Their comorbidities, preop imaging with respect to endometrial thickness were taken into consideration. The age, parity, menopausal status and presenting symptoms. The chi-square and the multivariate regression analysis done using the SPSS

FIG -8multivariate analysis of the factors influencing the nodal status in papillary carcinoma

III. RESULTS

Our study analysis revealed that maximum cases of clear cell in the median age range of 61 yrs, 13 (62%) more than 60yrs. Most of the clear cell associated with co-morbidities 21 cases(100%). 17(81%) were multiparous. They usually present with post-menopausal bleeding 20(95.2%), few presented with watery discharge 2(9.5%) Pre-op imaging revealed, endometrial thickness of 15 mm was detected in 47.5%, range of minimum of 3mm to a maximum of 34 mm recorded. 14(57%) showed a grade 3. The nodal positive status 12(57%). On multi-variate analysis, lymphovascular space invasion and myo-invasion was found to statistically significant, with a p-value. **.052 and .065** respectively that affected the nodal status in clear cell carcinoma. UPSC was, more prevalent in age group of 61 yrs, multiparous 13(76%), median of 61.5 yrs. Most of them was associated with co-morbidities 8(47%), 94% attained menopause and presented with postmenopausal bleeding(100%). The pre-op imaging showed a median of endometrial thickness of 14.5 mm, 9 (53%) the minimum of 3.5 mm to a maximum of 34mm were recorded. (66%) 12 cases presented with grade 3 **11(61.7%)** were nodal status positive in UPSC. The myo-invasion >50%, LVSI+omentum+ peritoneal cytology+, adnexa+, was significantly associated with nodal positivity in UPSC in multivariate regression analysis with a p value of **.03, .03, .046, .046, .022**. **Conclusion** – Most of the cases of upsc and clear cell in our study group present in postmenopausal age group, with post-

menopausal bleeding. All cases of clear cell were associated with comorbidities. Although the spectrum of presentation varied from watery discharge to bleeding in clear cell. The range of endometrial thickness varies from 3mm to 34 mm. In our study 57% case clear cell presented in stage III. The nodal status was significantly influenced by lvsi and myo invasion.

All cases of upsc presented with postmenopausal bleeding. maximum number cases had the co-morbidities. 61.7% presented in stage III. The factors such as myoinvasion, lvsi, omentum+ adnexa+, positive peritoneal washings significantly influenced the nodal positivity of upsc.

- **Purpose** – Was to present the clinicopathological features and analyses of the factors influencing the lymphnode, Due to the rarity of the UPSC, the clinicopathological of the patients with upsc is poorly understood. Further more randomized clinical trials aiming at exploring standards of treatment for clear cell and papillary serous cancer

Abstract

The main purpose of this study is to investigate the effect of employee satisfaction and organizational commitment. Accordingly, this paper attempts to review the articles and research papers based on employee satisfaction and organizational commitment on work at different institutions. In identifying the effect of employee satisfaction and their organizational commitment to work, the researcher incorporated a survey methodology in which the researcher did an in depth analysis into the relevant literature and sources. The analysis of relevant literature and discussion suggest that there is a better co-relation between these two variables namely employee commitment and satisfaction and organizational commitment.

Keywords: Job satisfaction, Employee commitment, employee–employer relationships, working environment

1. Introduction

Employee satisfaction and retention are very important issues for an organization. And also it is very essential to people who study the relationship between employee satisfaction and organizational commitment (Syptak et al., 1991). One studies have paid attention to employee satisfaction in a private religious institutions (Schroeder, 2003).

There is an interest in employee satisfaction. Roznowski and Hullin (1992) explained that after an individual is rented, knowledge of the employees' satisfaction becomes the very essential part of data in an organization.

Robbins (1998) explained about the important of job satisfaction. A satisfied workforce gains higher outputs. Employee absenteeism, departure of good employees and incidences of destructive employee behavior are less disruptions for an organization. One of a research has been done in this area. But still there are some major controversies such as what are the main factors are that contribute to employee satisfaction and dissatisfaction. Employee achievement, the work itself, job recognition, advancement and responsibility are gained the employee motivation and satisfaction. These are the intrinsic factors for the employee satisfaction (Hackman and Oldman, 1980; Herzberg, 1957). Some studies highlight wage, policies of the company and administrative as well as supervisory practices are important for employee satisfaction. These factors explained as extrinsic factors (Butler, 1982; Gruenburg, 1980; Herzberg, 1957; Seybolt, 1976).

Linkages have become progressively essential in modern society. Mowday et al. (1982), employee–employer relationships and social linkages are the important things for employee commitment to the organization. The quality of employee and employer relationships is important for an organization as well as individual and the society. These consequences include both negative and positive consequences. Turnover, low productivity, tardiness, absenteeism and theft influence for negative behaviors. Loyalty,

high productivity, dedication, punctuality and commitment has no impact to positive behavior. Positive behaviors encourage the organization's success (Newstorn and Davis, 1997). Strong linkages are help to the wellbeing of an entity (Tyree, 1996). Wood (1976) emphasizes, "the health of a higher educational institution depends on the job satisfaction of its employees". Problems related to job satisfaction and organizational commitments among employees within different types of organizations have been studied broadly by the researches in different countries. Spector (1997) described that job dissatisfaction and poor commitment of employees lead to negative repercussions in an organization. Employees' absenteeism, lack of interest in the work and high employee turnover are few examples. Lack of promotional opportunities, poor working environment, employee relations and unsatisfied supervision are some of the factors that affect job satisfaction of employees. Herzberg (1959) in his motivation theory explained that some of the employees motivated to perform an activity for its own sake and personal rewards. And the other type of employee are motivated to perform an activity to earn a reward or avoid punishment. Large number of researches have been done to find out the factors that influence to the employees satisfaction and organizational commitment. (Oshagbemi 2003; Lu et al.2005; Horton 2006; Chen et al. 2006). Chen et al. (2006) developed a model of six factors to measure the satisfaction of university teachers, namely organization vision, respect, result feedback and motivation, management system, pay and benefits and work environment.

2. Purpose of the Study

The employee satisfaction is a crucial factor for the advancement of any organization. Employees' commitment for the development of an organization and the satisfaction of their customers are greatly influenced by the employee satisfaction. Employees are considered as the internal customers of an organization. Hence their satisfaction with the existing working environment of the organization will support to achieve the long term and short term financial and non-financial goals of an organization.

Employee satisfaction has been given the minimum attention in many organizations. Most of the mangers have not recognized the importance of job satisfaction. Therefore, most of the organizations are not gaining the maximum contribution from its employees. There are many factors that affect the dissatisfaction of the employees which cause financial as well as non-financial problems to the organization.

Most of the organization focus and invest to increase their customer satisfaction and pay minimum attention on employee job satisfaction which affect one of the most important factor for the sustainable development of any organization. Continues less attention or less zero investment on human capital development will affect the organization to move away from its main goals and objectives and make them less competitive in the market. Therefore it is important to study and understand how the organizational commitment impact on employee satisfaction. Hence the purpose of this study is to identify the relationship between employee satisfaction and the organizational commitment.

3. Literature Review

The employee satisfaction is the most acceptable and the most widely used theory than any other theories of motivation (Alexander, 1985; Iredale, 1985; Schroeder, 2003; Srisawat, 1990; Thorn, 1985) explains that the motivation-hygiene theory is preferred over the alternative theories. Because it becomes a tool of the management and had motivated many empirical and theoretical studies related to employee satisfaction and commitment.

To motivate employees, it is essential to supply one or more satisfiers of Herzberg's. Those satisfiers can be explained as motivators, comprised a sense of achievement, creative or challenging work, advancement opportunities, responsibility and recognition. These factors are helpful to develop and grow employee as a person and professional.

This theory shows that not only hygiene factors to avoid employee dissatisfaction. But it is essential to provide factors intrinsic to work it. There are numerous discussions over issues about the relationship between job satisfaction and organizational commitment. Few researchers have explained that the employee satisfaction is a predictor of organizational commitment (Dramstad, 2004; Ferris, 1986; Meixner and Bline, 1989; Porter et al., 1974; Price, 1977; Rose, 1991; Williams and Hazer, 1986). Some other studies have explained organizational commitment as a predictor of employee satisfaction (Aranya and Ferris, 1984; Aranya et al., 1984; Bateman and Strasser, 1984; Lachman and Aranya, 1986; McGregor et al., 1989). However these studies have suggested a different causal procedure between employee satisfaction and organizational commitment.

Hygiene Factors - Herzberg stated that hygiene factors relate to the environment in which the task is carried out and do not directly relate to the task. The hygiene factors are the causes of job dissatisfaction on the job and the existence of negative hygiene factors will lead to employee dissatisfaction and unhappiness. However, employee satisfaction will not be attained by improving these factors. Improving hygiene factors is preventing the impediments of Job dissatisfaction. He concluded that it is the presence of job dissatisfaction that makes employees to leave a company (Herzberg, Mausner and Snyderman, 1959,). Therefore, this will be the benchmark of evaluating the implementation of hygiene factors.

Motivation Factors - Herzberg stated that the motivation factors relate directly to the task being performed. The motivational factors were the primary cause of job satisfaction and a decline in these factors would not lead to job dissatisfaction. The individual would just go back to the original neutral level (Herzberg, Mausner and Snyderman, 1959). Therefore, this will be the benchmark of evaluating the implementation of motivation factors.

The job satisfaction can be define as an employee's affect to their job based on comparing real outcomes with preferred outcomes (Cranny, Smith, and Stone, 1992). In generally it can be recognized as a multifaceted construct. It is included employee feelings about a variety of both internal and external job elements (Howard and Frink, 1996). Porter and Steers (1973) controvert that the extent of employee satisfaction is reflected in the cumulative level of met worker expectations.

There are certain features with preferential values which are expected by the employees from their jobs such as pay, promotion, autonomy etc. The importance of these preferences can be differ across individuals, but when the unfulfilled expectations are accumulated, there is less job satisfaction and then they leave the career (Feilds, 2002) indeed, some interest in employee satisfaction is focused basically on its effect on absenteeism, intentions to quit, employee commitment and real turnover (Agho, Mueller, and Price, 1993). But some studies have explained the variance in turnover is a level of satisfaction. It may be smaller than originally thought (Hom and Griffeth, 1991; Lee, Mitchell, Holtom, McDaniel, and Hill, 1999). One other study presented that employees who changed jobs and moved into a new job had higher levels of satisfaction in the new job (Riza and Ganzach, 2014). The facets of meaningful work and promotion opportunities can be identified as important predictors of intentions to leave an organization. Mathieu's (1990) test has explained the effects of a variety of antecedents on organizational commitment were mediated by their impact on employee satisfaction (Feilds, 2002).

Aspects of the situation of work have been shown to be determinants of employee satisfaction (Arvey, Carter, and Buerkley, 1991). A broad situational factor, job level, is positively related with satisfaction with all aspects of the job. Because higher-level jobs effect to have better working conditions, promotion opportunities, pay, autonomy, supervision and responsibility (Feilds, <http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9272>

2002) found that perceptions that employees have about numerous aspects of their work environment (management climate, job content, reward fairness, employee influence and promotion opportunities) described job satisfaction. This study also indicates different patterns of work satisfaction at different age levels for non-college graduates (U shape), non-elite professionals (downward sloping) and elite professionals (upward sloping). Personal characteristics such as age, gender, education level, and pay grade did not contribute incrementally in explaining the variance in work satisfaction beyond that explained by variables describing the job situation. In Fields (2002) evaluation of alternative confirmatory factor models found that job satisfaction and the personality tendencies of negative and positive affectivity were empirically distinct. Job satisfaction can be describe as a satisfactory favorable emotional state resulting from the administration of one's job, an effective reaction to one's job and an attitude towards one's job (Weiss, 2011). According to this this definition we form attitudes towards our career by considering our feelings, beliefs and our behaviors. Cranny et al. (1992) explained that employee satisfaction is a contribution of cognitive and affective responses to the differential perceptions of employees. (Cranny, Smith, and Stone, 1992) Researchers like Porter and Lawler define job satisfaction as a one-dimensional construct; that is, you are generally satisfied or dissatisfied with your job (Porter and Lawyer, 1968). In contrast, Smith, Kendall and Hulin dispute that job satisfaction is something multidimensional; that means you may be more or less satisfied with your career, your supervisor, pay and the workplace (Smith, Kendall and Hulin, 1985). Two main theories that have always been referred in job satisfaction are Maslow's theory of needs and Herzberg's two factor theory. Maslow's theory has explained five levels of individual needs. They are self - actualization and esteem needs at the top level whilst social, safety and physiological needs at the bottom. This theory has frequently been used to conceptualize employee's motivation based on the different levels of needs. Maslow assumes that some needs are more important than other needs and must be satisfied before the other needs can serve as motivator (Maslow, 1959). However, studies dating back to Herzberg's have shown that workers satisfaction is as a result of motivation factors whereas dissatisfaction are a result of hygiene factors (Herzberg 1957). It is logical that more satisfied workers will tend to add more value to an organization. Unhappy employees will not give 100 percent of their effort for very long (Herzberg 1957) For the organization, job satisfaction of its workers means a work force that is motivated and committed to high quality performance. Increased productivity, the quantity and quality of output per hour worked seem to be a byproduct of improved quality of working life. It is significant to note that there is no conclusive or stable literature on the relationship between job satisfaction and productivity. (Spector, 1997)

4. Discussions

To understand the causes of employee (dis) satisfaction, Frederick Herzberg (1957) conducted a study that was later revalidated in 2003 by Harvard business school. In the late 1950s, many people considered Frederick Herzberg as a pioneer in motivation theory and he did a research with a group of employees to find out what mode them satisfied and dissatisfied on the job. Based on his findings, Herzberg created a two-dimensional paradigm of factors affecting employee' attitudes about work, intrinsic (Hygiene) and extrinsic (Motivators) factors as : Hygiene Factors Salary, Supervision, Company and Administration policy, Interpersonal relationship, Job security and Working conditions : Motivation Factors Achievement and recognition, Responsibility, Work itself Growth and advancement. These factors are directly influencing for employee job satisfaction and their commitment.

Tansel and Gazioglu (2014) indicate there are four measures of Job satisfaction; they are satisfaction with influence over job, satisfaction with amount of pay, satisfaction with sense of achievement and satisfaction with respect received from supervisors. The survey is rich in individual characteristics and workplace characteristics. A matched Employer-Employee survey and a rich set of questions on work conditions and management-employee relations were included in this research. The results in this research is to support the following propositions. First, the management employee relationships are not much content in large firms. However, there is also evidence that large firms are likely to compensate for their size by providing regular discussions of promotion possibilities, training needs and pay issues. Second we observe lower levels of job satisfaction in larger firms as it is

often reported in the literature. Third, the observed lower levels of job satisfaction in the large firms may be due to weak management-employee relationships. As per this study; staffing issues, pay issues, health and safety at work, chances of promotion, training needs, and management-employee relationships are influencing factors for employee job satisfaction and their commitment.

Chen et al.,(2006) has introduced an employee satisfaction model for higher education. That study had used relevant academic literature to establish a satisfactory model for the university teachers in Chin Min Institute of Technology which is a private university situated in middle Taiwan. Using a questionnaire based on the Importance of satisfaction model, 248 teachers were administered the questionnaire, to investigate and analyze their importance of satisfaction level. There are six dimensions in this model. They are organization vision, respect, result feedback and motivation, management system, pay and benefit and work environment.

An individual or an employee who is already satisfied with basic needs will focus on social needs and esteem needs. Accordingly, the college teachers who are already satisfied with physiological and safety or security needs focuses on higher salaries and fair promotion system (Chen, Yang, Shiau, and Wang 2006).Therefore, salaries and promotion system are directly influencing employee's job satisfaction and their commitment.

Humborstad and Perry (2011) employee job attitude were measured using job satisfaction and organizational commitment. Humborstad and Perry (2011) have tested the relationship between perceived practices and Chinese employee service effort. Although it has tested the turnover intention to inspect the mediating role of employee attitudes in this relationship. By this research employee job attitudes were measured by using job satisfaction and organizational commitment.

Humborstad and Perry (2011) have developed a model of the mechanisms of their empowerment that includes the variables of job attitudes. These variables of job attitudes combine employee satisfaction with affective organizational commitment.

Employee empowerment gives employees greater autonomy and responsibility in handling daily activities (Haas, 2010). It allows employees to solve problem themselves (Humborstad and Perry, 2011). Researches in the West suggest to stimulate the untapped human resources to empower employees (Spreitzer, 2008). Empowerment efforts in China need to be linked with the creation of positive attitudes for it to deliver the desired output for an organization. Positive attitudes can be created through wider communication on empowerment efforts, and stronger organizational and supervisor support (Sut, Wong and Chad 2011) Positive attitudes create pleasant working environment. In this situations can see supervisors are parsing and acknowledging employees. Therefore, the above factors can be introduced as influencing factors for employee job satisfaction and their commitment.

Cho and Park (2011) investigated the role of trust within one US federal agency, the Federal Administration, by examining the relationship among several managerial practices, trust and employee attitudes including employee satisfaction and organizational commitment. Trust is very essential for employee job satisfaction and their commitment. Cho and Park (2011) has identified three types of trusts. Basically, they have divided into two as fallows; Vertical Trustsand Horizontal trust. Vertical trust means Trust in management andTrust in supervisors. Horizontal trusts mean Trust in co-workers.

Trust in management has a larger effect in commitment than the other two forms. Trust in management is substantially associated with employee satisfaction and organizational commitment. Having trustworthy supervisors increase thee supervisor employee satisfaction but it does not increase commitment. Because employee consider supervisor as separate from the organizations. Trust in co-workers is positively related to satisfaction and commitment.

However, compared to trust in management, trust in co-workers is weekly related to satisfaction and commitment. Trust in management, trust in supervisor and trust in co-workers are influencing factors for employee job satisfaction and their commitment.

Bjerke, Ind and Paoli (2007) have explained that the aesthetic environment in work places creates positive feelings and the removal of existing nice environment would create dissatisfaction.

This correlates with Herzberg's argument (Herzberg, 1957) that environment and working conditions influence people's dissatisfaction with their work, whereas people are seldom made satisfied by a good environment – that relies primarily on the job itself. Employees working with business clients are happier when the workplace have aesthetic feature (Bjerke, Ind, and Paoli 2007).

According to Bjerke, Ind and Paoli (2007), a strong organizational culture contributes to strengthened feelings of identity among employees. The clearer the company values are defined and explained, the stronger the sense of being a part of the organization. The degree is determined by the length of time an employee work for a company, the importance of their job, the quality of employee working environment and the quality of the colleagues. Bjerke, Ind and Paoli (2007) has identified pleasant working environment, nice colleagues, and varied job tasks as motivational – and satisfaction factors. The analysis of the interviews explained that employee satisfaction seemed good. There could be an impact of physical environment on the satisfaction employees. But they didn't think that people were so aware of the influential power of art, design and architecture.

In general, respondents believed that a nice environment created positive feelings among them and several respondents agreed that if the unique art, design and architecture at Telenor was "removed" or changed, dissatisfaction could well increase. This tie in with Herzberg's argument (Herzberg, 1957) that environment and working conditions influence people's dissatisfaction with their work, whereas people are seldom made satisfied by a good environment – that relies primarily on the job itself.

Several of those working with business clients mentioned a sense of pride also because of the art, design, and architecture, particularly when they had customer meetings at the company site, and when they took customers on a tour to show art, design, and architecture.

When employees identify themselves with the culture, the working environment will have a tendency to become more pleasant and this again may increase morale. Telenor says that employees seem to identify with the company and its culture, the internal co-operation may become better and new ideas welcomed. Employees who are allowed to work with a greater freedom and flexibility are more creative than the employees with less freedom and flexibility. The open space office leads to greater creativity because of the possibility to exchange ideas and thoughts with colleagues.

Nicholas and Paoli (2007) suggest that there could be a link between physical environments, creativity, and the provision of service quality. If this explained that the environment contributes to performance improvement and to a change in motivation. Physical environment motivate them to provide a better service quality to customers. A strong organizational culture leads to stronger employee performance.

Brown and Sargeant (2007) has stated age, education, gender, Occupational area and tenure, salary and fringe benefits, organizational policy and administration are influential factors for employee job satisfaction and their commitment. Brown and Sargeant(2007) found the longer employees stayed at their institution, the higher the levels of organizational commitment and employee satisfaction.

Wang and O'Reilly (2010) examined the relationships among dispositional sources of value preferences and personality attributes, organizational commitment and satisfaction. He has identified four types of models for employee job satisfaction and

their commitment. They are; Direct effects of dispositions on organizational commitment, direct effects of dispositions on organizational satisfaction, direct effects of dispositions on organizational satisfaction, which in turn explains organizational commitment and Mediation effects of organizational satisfaction on the relationship between dispositions and organizational commitment.

Wang and O'Reilly (2010) has focused on two types of organizational commitment: instrumental commitment and normative commitment (Caldwell, Chatman and O'Reilly, 1990) The instrumental commitment focuses on reward-based incentives of the organization and the nature of an exchange relationship between the individual and the organization, while the normative commitment refers to individuals' commitment to the organization because of the internal factors of the organization. These might include for example, the norms, values and culture that characterize the organization, which are shared by individuals and the organization.

The models of direct effect of disposition on organizational commitment as well as the mediation effect of organizational satisfaction on the relationship between disposition and organizational commitment.

Piketon Research and Extension Center -1998: James R. Lindner, a researcher and extension Associate of The Ohio State University conducted a research study on employees' satisfaction at Piketon Research and Extensions center (Linder.1998).

The employees were requested to rank the importance of the following ten factors of Herzberg's theory. They are job security, sympathetic help with personal problems, personal loyalty to employees, interesting work, good working conditions, tactful discipline, good wages, promotions and growth in the organization, feeling of being in on things, and full appreciation of work done. The research design of this study employed a descriptive survey method. The target population of this study included employees at the Piketon Research and Extension Center and Enterprise Center (centers). The centers are in Piketon, Ohio. The ranked order of factors were Interesting work –motivation factor, good wages – hygiene factor, full appreciation of work done – motivation factor, job security - hygiene factor, working condition - hygiene factor, promotion and growth - motivation factor, responsibility - motivation factor, personal loyalty to employees - hygiene factor, supervision - hygiene factor and interpersonal - hygiene factor.

Canada 2003: Employees satisfaction research was conducted in twelve different studies in Canada (Ouedraogo and Leclerc, 2013). The sample of the studies were a wide cross-section of different industries and job classes, and included lower level supervisor. The findings from this study reviewed that the top two motivators leading to employee satisfaction were achievement, and recognition for the achievement. These are the motivation factors. The top two de-motivators leading to employee dissatisfaction were bureaucratic and unfair company policies and administration, and poor supervision. These are the hygiene factors (Ouedraogo and Leclerc, 2013). The findings are in line with Herzberg's findings on factors that satisfy and dissatisfy employees (Herzberg, Mausner and Snyderman, 1959). It is essential to note that an average wage did not lead to employee satisfaction. And also it is not lead to job dissatisfaction. An inadequate wage however resulted in employee dissatisfaction.

Herzberg's Research: Herzberg conducted an employee satisfaction research study on 200 Pittsburgh engineers and accountants in the 1940's. Herzberg's research used a pioneering approach, based on open questioning that was explorative approach and very few assumptions to gather and analyze details. Herzberg's combined this approach with open interviews in order to get more meaningful results than the conventional practice of asking closed (basically yes/no) or multiple-choice or extent-based questions. In his studies, he discovered that the factors that produced job satisfaction were separate and distinct from those that lead to employee dissatisfaction. However, the extrinsic factors (motivators) were the primary cause of employee satisfaction

and the intrinsic factors were the causes of dissatisfaction on the job. He concluded that it is the presence of employee dissatisfaction and unhappiness that makes employees to leave a company (Herzberg, 1957).

5. The conclusion and future research direction

Internal factors have an effect on job satisfaction and employee commitment. The focus is on factors that management can control to improve employee satisfaction and commitment. The job satisfaction survey should be conducted from time to time. In the future surveys can also focus on “External factors that have an effect on job satisfaction and employee commitment”.

Abstract; Muslims in Indonesia occupy the first rank in terms of quantity. Along with that, naturally it is fulfilled its needs in the field of law, both in the civil and criminal fields. In the civil sector, many laws have been born, for example; waqf laws, zakat laws, marriage laws and compilation of Islamic law, banking laws and a series of other laws including religious justice laws. This is a manifestation of the struggle of Muslims to align Islamic law in the legal system in Indonesia. These successes did not dampen the enthusiasm of Muslims to continue to fight for their rights in the form of a compilation of sharia economic law which contained the regulation of the economic dispute of Muslims. The application of this effort is the cultivation and desire of Indonesian Muslims in positioning themselves in the field of law, which is called Islamic law positivation into national law. The struggle for compilation of Islamic law in Indonesia as a form of handling the problem of legal disputes in the civil sector, apart from the issue of waqf, zakat and marriage, banking disputes in Indonesia have reached a deadlock, should be found the right solution by formulating a law that is the legitimate basis for resolution the problem of bank disputes among the people, especially the issue of status and ownership rights of customers who are customers of Islamic banks.

This problem is related to the concept of contract contained in chapter II, but if further observed the settings in book I (subject to Law and Amwal), Book III (Zakat and Grants), and Chapter IV (Shari'ah Accounting), basically concerns the problem contract. However, in several articles, for example in the capital market discussion (article 580-583) it is not included in the contract but about the place where the contract is held. On the other hand, the practice of agreements that are mudhorobah has been expanded again with the existence of intermediary parties, namely banking. So as to reduce the risk of moral hazard, usually in other Shari'ah banks and institutions, debtors must include their collateral. It seems that the Codification of the Sharia Economic Law needs to be carefully regulated regarding this guarantee. If the debtor includes the guarantee while the business experiences a loss, what will the Bank or Islamic Financial Institution do with the guarantee. Bearing in mind the mudhorobah system if there is a loss due to the normal process of the business, and not due to negligence or fraudulent management, the loss is borne entirely by the owner of the capital, while the manager loses the energy that has been poured out, while the manager loses due to negligence and fraud. completely against these losses. On the settlement side, it is not possible to settle the dispute in the district court, so that the religious court is the only court that is used as a place for resolving the dispute.

Keywords: Legal compilation for the certainty of the banking system

A. Introduction

At the beginning of the 20th century, Islamic banks were only an obsession and theoretical discussion of academics from both the field of Islamic law (fiqh) and economics. Awareness emerged that Islamic banks were the solution to solving the nation's economic problems for the achievement of social welfare, but concrete efforts that enabled the practical implementation of the idea were almost drowned in a sea of world economic systems that could not escape the interest of banks with conventional systems. Nevertheless, the idea continues to grow even if only slowly. Several trials continue to be carried out starting from simple project forms to large-scale cooperation. From this effort the proponents of Islamic banks can think of making a banking system infrastructure that is interest-free.

The development of the Islamic economic system from time to time along with the struggle with the world economic system (capitalist and social), economic development in Indonesia can be said to experience delays compared to other Muslim countries. The development of the Indonesian economy since the 90s, faced with the nuances of information disclosure and the rate of economic growth in Islamic countries in the world, then at the same time Muslims in Indonesia play an important role in developing and growing Islamic economic systems with reason and enthusiasm to avoid usury. the emergence of Shari'ah banking in Indonesia as evidence of the attention of Muslims and the establishment of Bank Muamalat as the first Islamic Bank as a means of developing Islamic economics and supporting the country's economy. When compared with Malaysia, this country has far demonstrated its economic development with a satisfying Islamic banking system.

After the existence of Bank Muamalat in Indonesia, the presence of this bank was enough to give a prospect on the national economic scene, especially after it appeared in 1992, which was able to ward off Indonesia's economic crisis around 1998. The presence of the Bank was followed by Sharia Financial Institutions (LKS) others such as the Bank of Sharia Financing and other syari'ah microfinance institutions are determining economic growth in Indonesia.

Seeing the reality of developments and positive consequences for the development of Islamic financial institutions, with the emergence of Islamic Banks and Islamic Financial Institutions - other Sharia Financial Institutions show significant consequences of the development of Islamic economic institutions, of course they will be faced with problems that arise due to attraction interesting between the interests of the parties in economic matters, meanwhile, currently there are no specific legislation that specifically regulates these problems. Furthermore, in 1994, the existence of the Syari'ah Arbitration Board became the only mediator institution for resolving disputes between parties in terms of the Shari'ah economy. The presence of this institution determines the birth of legal decisions in the field of syari'ah arbitration which is not necessarily a legal binding. The regulations applied are still limited to following the Bank Indonesia (BI) Regulations and only refer to the fatwa of the National Syari'ah Council of the Indonesian Ulema Council. While the fatwa itself is only a non-binding legal opinion.

In line with the efforts of Shari'ah economic law positivist in Indonesia became a sign of starting a new direction of legal policy for banking management in Indonesia after the revision of Law No. 7 of 1989 became Law No. 3 of 2006 concerning the Religious Courts. In the revision, it is stated that the Religious Courts are currently not only authorized to settle disputes in the fields of marriage, inheritance, wills, grants, endowments and sadaqah, but also the Religious Courts are authorized to handle adoptions and resolve disputes over zakat, infaq and the Islamic economy.

The consequences of the expansion of the authority, requiring law enforcers, especially in the Religious Courts and the Supreme Court, must prepare law enforcers at the judiciary by increasing their capability in the Islamic economy to provide a sense of justice for the community, especially sharia law with material the legislative material mandated by the Act in question, for example in terms of resolving Muslim disputes in the field of shari'ah economy.

As a follow up to this, the Supreme Court formed the Compilation Team of the Syari'ah Economic Law Compilation, the existence of this Compilation of Syari'ah Economic Law is indeed very necessary as a guide and reference for the Religious Courts in deciding sharia economic disputes. To compile a draft Compilation of Syari'ah Economic Law, the team from the Supreme Court has held various discussion and seminar events that examine the draft of the manuscript with institutions, scholars and legal experts, so that in approximately one year the compilation of the Shari'ah Economic Law Compilation completed. However, as an effort to maximize and improve the Compilation of Syari'ah Economic Laws, towards the ideal format, of course the efforts to get the criticism received responses from various parties to continue to be followed up to date.

B. Positivation of Islamic Law in Indonesia

The application of the concept of Islamic banks requires sharia economic law or positivation legislation in Indonesia. This law has an important position in the legal system in Indonesia. Therefore, in order to be able to apply formally it is necessary to positivate sharia economic law. The positivity of sharia economic law in Indonesia originated from the birth of Law No. 10 of 1992 which contained provisions concerning the possibility of banks operating with profit sharing systems. UU no. 7 of 1992 concerning Banking has not explained the definition of profit sharing and the understanding of the results of the statement is further explained in Government Regulation (PP) No. 72 of 1992 concerning Banks Based on Principles of Profit Sharing and promulgated on October 30, 1992 in the State Gazette of the Republic of Indonesia No. 119 of 1992. The Bank is based on the profit sharing principle then described in a Bank Indonesia Circular Letter (SE.BI) No. 25/4 / BPPP dated February 29, 1993.

In 1998 Law No. appeared. 10 of 1998 concerning Amendment to Law No. 7 of 1992 concerning Banking, where there are changes that provide greater opportunities for the development of Islamic banking. Enactment of Law No. 10 of 1998 was followed by the issuance of a number of implementing provisions in the form of a Decree (SK) of the Bank Indonesia Board of Directors which provided a stronger legal basis and broad opportunities for the development of Islamic banking in Indonesia.

Based on this new Banking Law, the banking system in Indonesia consists of Conventional Commercial Banks and Islamic Commercial Banks (or used the term System Dual Banking). Since the enactment of Law No. 10 of 1998, followed by government policies which were originally set out in the form of Government Regulations transferred to the Policy of Bank Indonesia (BI) as the Central Bank. The Bank Indonesia Policy Regulation that replaces the position of PP in the Banking sector is an improvement on the provisions that support the operation of Sharia Banking in Indonesia.

With the issuance of Law No. 23 of 1999 concerning Bank Indonesia, so in the explanation of the Law it has been mandated that to anticipate the development of sharia principles, the duties and functions of BI to accommodate these principles. In order to fulfill the mandate, Bank Indonesia has opened a Sharia Banking Bureau that handles the regulation, supervision and licensing of Islamic banks. On the other hand, the Indonesian Ulema Council has also formed a National Sharia Council which is tasked with providing fatwa 27 and establishing a Sharia Supervisory Board (DPS) in every Islamic financial institution in Indonesia. These two institutions work together to issue legal products or fatwas for the development and supervision of Sharia Banking business activities and activities in Indonesia.

In connection with resolving sharia economic disputes, with the issuance of Law No. 3 of 2006 concerning Amendment to Law No. 7 of 1989 concerning the Religious Courts, then sharia economic disputes constitute the absolute authority of the Religious Courts. This law is a product of legislation that first gave competence to religious courts in resolving sharia economic cases.

Along with the rapid sharia banking industry in Indonesia, it requires a separate regulation which is *lex specialis* from the Banking Law. On July 16, 2008 Law Number 21 of 2008 concerning Sharia Banking was ratified. Birth of Law No. 21 of 2008 the existence of Islamic Banking has become stronger and has a stronger legal basis. However, on the other hand, the provisions of Article 55 paragraph (2) of Law No. 21 of 2008 along with its explanation, juridically, shows that there has been a reduction in the competence of religious courts in the field of Islamic banking. Given Law No. 3 of 2006 has provided absolute competence in sharia economic matters (including Islamic banking) to the Religious Courts. Islamic insurance emerged in 1994 along with the inauguration of PT. Syarikat Takaful Indonesia which later established 2 subsidiaries namely PT. Family Takaful Insurance in 1994 and PT. General Takaful Insurance in 1995. This insurance operating license was obtained from the Ministry of Finance through Decree No. Kep-385 / KMK.017 / 1994 dated August 4, 1994. From a legal standpoint, Islamic insurance is still basing its legality on Law No. 2 of 1992 concerning Insurance Business which actually does not accommodate sharia insurance because it does not regulate the existence of insurance based on sharia principles.

Indonesia, which is inhabited by the largest number of Muslims, has also contributed its thoughts and actions in order to advance Indonesia in general, on the other hand it cannot be denied that Muslims must be able to fight for their needs or needs in various ways including the current positivisation of Islamic Law. into national law. Legal experts often call it the theory of existence which in relation to Islamic law is a theory that explains the existence of Islamic law in Indonesian national law. The Indonesian national law is a national law originating from the Pancasila state philosophy.

The positivist effort itself has actually been going on for a long time, with the issuance of the Agrarian Law of 1960, Law Number. 1 of 1974 concerning Marriage Law, then increased to Islamic law as a source of national law in Law Number. 7 of 2009 concerning Religious Courts, Presidential Instruction No. 1 of 1991 concerning the socialization of the Compilation of Islamic Law, Law Number. 41 of 2004 concerning Waqf, Zakat Law, Hajj Act and the last Law Number. 3 of 2006 concerning Amendment to Law Number. 7 of 1989 concerning the Law on Religious Courts which provides the expansion of material competence for the Religious Courts, including in the economy of Shari'ah.

When talking about law, in fact it will not be far from the political range. The involvement of Muslims in political matters also determines the character of the legal product produced. The character of legal products is identical to the nature and nature of legal products. Referring to the statement above, then it should provide opportunities in various fields, including the law on sharia economic disputes settlement in the form of the Compilation of Shari'ah Economic Law (KHES), so that Muslims can breathe a sigh of relief. The law is into national law. The application of the desires and results of the efforts of Indonesian Muslims is in the field of law.

Law is not entirely autonomous institution, but it is in a position that is interrelated with other sectors of life in society. One aspect of this situation is that it must always make adjustments to the objectives of the community. Therefore, law is a dynamic. Political law is a factor of cause such dynamics, therefore it is directed to the *iure constituendo* (*ius constitutum*) that law should apply.

The development of national law objectively recognizes legal plurality within certain limits. The policies of customary law and religious law for certain legal and natural environments are therefore not possible to impose a legal unification for several fields of life. There is no need to question if the subject of Islamic law is carried out by Shari'ah economic law. Furthermore, it is also natural in family relations that sometimes local customary law is more dominant. The principle of legal unification must be a guideline, but so far unification is impossible, then the plurality of laws must be accepted in reality. Ideally legal plurality must be accepted as part of the national legal order.

Through the struggle of Islamic nationalist founding fathers to incorporate Islamic values into the Indonesian constitution with the seven words in the Pancasila as the basis of State ideology, it has shown the effort to proceed, even though the the struggle to include the seven words in the Pancasila failed to realize the reason for the creation of national unity and unity. This is not an obstacle to continuing to fight for Islamic values in every constitution in Indonesia.

Referring to this description, actually since the establishment of this State Islamic values have been fought for in the field of law, as Soepomo argues, explaining that Indonesia does not have to be an Islamic state, but a country that uses the noble moral basis advocated by Islam. If examined in depth these opinions, it is appropriate that Muslims in Indonesia must continue to fight for and maintain and enhance Islamic values in fields that are very urgent needs to regulate and resolve the problems faced by Muslims today. Of course to fight for a constitution based on the moral basis of Islam must be encouraged by the performance of Muslims themselves in every policy. Both for those who sit in Legislative institutions, Executive institutions and Judicial institutions. Without the role of Muslims in these institutions it is impossible for Islamic moral values to be fulfilled and placed in the Indonesian constitution. This can be achieved and at least depends on tenacity and shrewdness because often political interests can hinder the program of Islamic law legislation. However, Indonesian Muslim-majority society has made Islam as a way of life in daily life, of course, only limited to personal and in limited matters.

Thus, the presence or absence of an Islamic political obsession in various legal formulations organically from fundamental norms and constitutional activities in the course of the nation's history does not have the slightest influence on the existence of Islamic law. The close closure of the opportunities at each social and political forum is not able to withstand the seepage of Islamic law. To be able to answer that challenge, Muslims must also have the right methodology and strategy for the positivist efforts of Islamic law in Indonesia. Because the views of different policy holders, including among the Islamic community itself, so that the attraction of interests between various existing political interests, including with the state or exponents of other religions will be increasingly stringent.

According to Syamsul Anwar as quoted by M. Rusydi, there are at least two stages for the positivist process of Islamic law, namely the hermeuneutis stage and the political stage. At the stage of hermeuneutis there is a need for classification of shari'ah law so that the classification can produce a legal format that has been compromised with the context of space, time, situation, and conditions of the Indonesian people. Therefore, the terminology put forward has become a universal language that will be easily accepted by all groups. Whereas at the political stage carried out by the legislature, people's representatives, especially those carrying out Islamic values can dialogue about Islamic values with various legislators. So that qualified foresight and lobbying from Islamic legislators is crucial. Related to the Islamic economy that has spread in this country, of course many expect a set of rules that are certain about it. Through efforts to compromise politics and the sincerity of various parties little by little the regulations concerning the shari'a economy have begun to be rolled out including the existence of the Compilation of Shari'ah Economic Law.

Thus the positivisation of Islamic law in Indonesian National Law can be achieved if various parties are able to lift macro and micro potentials of Islam that are able to blend with national law can certainly be supported by two abilities and stages, namely the potential that emerges from Muslims as implementers of Islamic teachings itself and sustained by the next stage, namely the political stage, namely the stage of Muslims who are able to fight for it in the legislature, people's representatives, especially those carrying out Islamic values can dialogue with various other legislators, so that carefulness and lobbying by Islamic legislators becomes very decisive to produce results.

C. Urgency of Codification of Shari'ah Economic Law

After the birth of various laws relating to the needs of Muslims starting from the Agrarian Law of 1960, Law No. 1 of 1974 concerning Marriage Law, then increased to Islamic law as a source of national law in the Law Number. 7 of 2009 concerning the Religious Courts, Presidential Instruction No. 1 of 1991 concerning socialization of the Compilation of Islamic Law, Law No. 41 of 2004 concerning Endowments, Zakat Law, Hajj Act and the last Law No. 3 of 2006 concerning Amendments to Law -Number of numbers. 7 of 1989 concerning the Law on Religious Courts (UUPA) which provides for the expansion of material competence for the Religious Courts. This did not dampen the enthusiasm of Muslims to identify the needs of Muslims which must be addressed in regulations as directors in the lives of Muslims in all fields, then other important things were hastened so that Muslims struggled for Sharia Economic Law which was then formulated in the form of Legal Compilation Syari'ah Economy (KHES), considering the shari'ah economic law as the law of muamalat has a variety of different views.

Codification is the collection of various regulations into laws or matters for the preparation of statutory books. In its history, the formulation of a law or regulation was made in writing called *jus scriptum*. In subsequent developments various regulations in written form were born called *corpus juris*. After the number of regulations became so many, it required a legal codification that gathered various kinds of laws and regulations.

Legal experts try to master the regulations well so that they can solve various kinds of legal problems that arise in the community with full justice and benefit. In making decisions in the courts in the field of Islamic economics there is a possibility of differences of opinion. Therefore, legal certainty is needed as a basis for decision making. Moreover, with the characteristics of the muamalah which are "elastic and open", it is very possible to vary these decisions which can potentially hinder the fulfillment of a sense of justice. Thus the birth of Codification of Sharia Economic Law in a Civil Code of Islamic Law became a necessity. It is understandable that the formulation of material for Codification of Sharia Economic Law is not found in Jurisprudence in Indonesian judicial institutions. Nevertheless, jurisprudence in the same case can be referred to as long as it does not conflict with the principles of sharia economic law. That is, the legal decisions of the past were disputed, because they were judged to be in accordance with sharia.

So the work of the Indonesian sharia economic mujtahids, not only formulates new economic laws that come from *fiqh* / sharia norms, but how can they facilitate existing national law. National law sourced from the Civil Code (BW), most likely in accordance with sharia, then the material and legal decisions in the form of *jurisprudensi* can be accepted or adopted.

Based on that rationale, then sharia economic law originating from *fiqh muamalah*, which has been practiced in activities in Islamic financial institutions, requires a forum for legislation to facilitate its application in business activities in these Islamic financial institutions. The existence of Sharia Economic Law Codification is a new breakthrough as an effort of Islamic Law positivisation into national Law. The rapid development of the Syari'ah Economy in Indonesia has made the need to prepare material for the Shari'ah Economic law to be held immediately. In the framework of these needs Codification of Sharia Economic Law finally emerged as the material law of the Shari'ah economy.

D. Analysis of Compilation of Shari'ah Economic Law

When the authority to adjudicate sharia economic legal disputes is the absolute authority of religious court judges, it is necessary to have a complete sharia economic law codification so that Islamic economic law has legal certainty and judges have standard references in resolving disputed cases in the Shari'ah business. In the field of marriage, inheritance and waqaf, we already have KHI (Compilation of Islamic Law), whereas in the field of Islamic economics we do not have it yet. The position of KHI is constitutionally, still very weak, because its existence is only as presidential decree. Therefore a stronger rule of law is needed which can be a reference for judges in deciding various legal issues. For this reason we need to formulate a Codification of Islamic Economic Law, as made by the Ottoman Turkish government named *Al-Majallah Al-Ahkam al-Adliyah* consisting of 1851 articles.

Codification is the set of various regulations into laws or the matter of drafting statutory books. Historically, the formulation of a law or regulation was made in writing called *jus scriptum*. In later developments various regulations were written in a written form called the *corpus juris*. After the number of regulations became so many, it required a legal codification that gathered various kinds of laws and regulations. The legal experts and judges also try to master the rules well so that they can solve various kinds of legal

problems that arise in the community with full justice and benefit. Based on that rationale, then Islamic economic law originating from fiqh muamalah, which has been practiced in activities in sharia financial institutions, requires a forum for legislation to facilitate its application in business activities in Islamic financial institutions.

In making decisions in the courts in the field of Islamic economics there is a possibility of differences of opinion. For this reason, legal certainty is needed as a basis for decision making at the Court. Moreover, with the characteristics of the muamalah which are "elastic and open", it is very possible for the variability of these decisions to be very potential to hinder the fulfillment of a sense of justice. Thus the birth of the Codification of Sharia Economic Law in a Civil Code of Islamic Law became a necessity. It is understandable that the formulation of material for Codification of Sharia Economic Law is not found in Jurisprudence in Indonesian judicial institutions. Nevertheless, jurisprudence in the same case can be referred to as long as it does not conflict with the principles of sharia economic law. That is, the legal decisions of the past were disputed, because they were judged to be in accordance with sharia. If you look at the contents of the Syari'ah Economic Law Compilation (KHES), of course there are still some things that can be used as notes for future improvements. Some of these things include:

1. Preparation of Compilation of Islamic Economics Law Codification

Impressed in the compilation of the Compilation of Shari'ah Economic Law, it was too hasty. The duration of the making of the Islamic Economics Law Codification is approximately a year. When compared to the making of the Compilation of Islamic Law (KHI) it seems that the preparation needed takes quite a long time. Compilation of Islamic Law was prepared since 1985 with the Joint Decree (SKB) of the Chairperson of the Supreme Court of the Republic of Indonesia and Minister of Religion No. 07 / KMA / 1985 and No. 25 of 1985 dated March 25, 1985. The period of project implementation was set for two years from the date of the enactment of the Joint Decree.

One of the most important things in drafting a law is the excavation of the sociological aspects of Islamic law and legal opinions among experts, scholars, pesantren and academics. This effort is a way to more "Indonesianize Islam" so that it is in accordance with the Indonesian culture itself. Besides that, by listening to input from each party, the existence of the law is expected to be of higher quality. When looking at the preparation for the preparation of the Codification of the Sharia Economic Law, it seems that it does not optimize the sociological aspects and legal opinions of many experts. Those involved in the preparation of the Codification of Sharia Economic Law are arguably only a small part, in contrast to the formulation of the Compilation of Islamic Law which involves many Ulama (Kyai), Islamic boarding schools, and the emission of several well-known State Islamic Institutes in Indonesia, and several other practitioners. But of course, this did not dampen our appreciation for the existence of the Compilation of Syari'ah Economic Law as a "grand" work from the Supreme Court as a new breakthrough in the History of Islamic Law in Indonesia.

2. The term Syari'ah in the Codification of Sharia Economic Law

The Material of Sharia Economic Law Codification (KHES) is basically a compilation of various types of fiqh that already exist, there are even a number of things that are classified as ijtihad compilation team of Codification of Sharia Economic Law itself. When looking at Shari'ah terminology as rules or points set by God so that humans make it as a rule in relation to God, fellow Muslims, fellow humans, and their environment. In other words, syari'ah is a basic, fixed and wide-ranging regulation. When using the term Shari'ah in the Codification of Sharia Economic Law, this contains contradictions because Economic Law, which is Muamalat Fiqh, is certainly not static but dynamic. As has become a general rule in muamalah, that the law of ashli from muamalah is permissible as long as there is no text that prohibits.

Economic law contained in the Codification of Sharia Economic Law is of course the result of human thoughts that will continue to be dynamic in accordance with the development of the times. Even the terms contained in the Islamic Economics Law Codification of course there are those that contain new terms such as capital markets or accounting. From this description, it is actually inappropriate to mention the term syari'ah in the Codification of Sharia Economic Law, perhaps it is more appropriate to use the term Islamic Economic Law as it is commonly used in other Islamic countries.

3. Content of Codification of Sharia Economic Law and Concept of Contract

When looking at the entire contents of the Islamic Economics Law Codification it seems too much to discuss the concept of contract. As stated by the Supreme Judge Dr. Abdurrahman, Islamic Economics Law Codification almost 80% contained about contract. In accordance with the contents of the Sharia Economic Law Codification, the discussion of the concept of contract can be found in chapter II, but if further observed the settings in book I (subject to Law and Amwal), Book III (Zakat and Grants), and Chapter IV (Shari'ah Accounting), basically related to the issue of contract. However, in several articles, for example in the capital market discussion (article 580-583) it is not included in the contract but about the place where the contract is held.

4. Formulation of Covenant Terminology

Concerning the formulation of the contract contained in the Codification of Sharia Economic Law article 20 number (1). This article defines a contract with an agreement in an agreement between two or more parties to do or not carry out certain legal actions. This formula seems to be just a duplication. Because the contract itself is translated by agreement or contract. According to Mustafa Ahmad Az-zarqaakad in language means al-rabth which means to collect or collect two ends of the rope and tie one to the other until both of them continue and become one strin.

There are several terminology of the contract proposed by experts including Wahbah Az-zuhaili defining the contract as a connection between consent and qabul that is justified by syara 'which creates legal consequences for the object. Meanwhile, according to Syamsul Anwar, the definition of contract with the meeting of consent and obedience is a statement of the will of two or more parties to give birth to a legal effect on the object. The definition of the contract shows the following: First, the contract is an attachment or meeting of consent and obedience which results in the emergence of legal consequences. Second, the contract is the act of two parties because the contract is a meeting of the ijab that presents the will of one party and the decree which expresses the will of the other party. Third, the purpose of the contract is to give birth to a legal effect. Thus, the meaning will be even richer if the terminology put forward by the Sharia Economic Law Codification does not contain duplication, but rather parses the principles of the contract such as the qabul agreement between the two parties.

5. Not Mentioning Sub-Subjects of Important Topics in Covenants

Sharia Economic Law Codification has not mentioned important sub-topics in the contract, so the contents are still too general. This will cause problems when cases arise which are not covered in the Sharia Economic Law Codification, so the interpretation of the "forced" judge will actually cause another problem, namely the sense of justice of the parties. This is where the need for a more detailed legal format, so that it can answer many problems. If the law is too global, the difference in interpretation especially for judges will not be inevitable given the different perspectives and paradigms of judges.

In Islamic law, recognizing the contract of al-Qardh is a loan contract to the customer (muqtaridh) which requires provided that the customer must return it at a specified time. This financing product is guided by the DSN fatwa No.19 / DSN-MUI / IV / 2001 concerning al-Qardh, Bank Indonesia Regulation No. 9/19 / PBI / 2007 and Law No. 21 of 2008 concerning Islamic Banking. In its implementation, this contract is rarely used by Islamic Banks because in this contract there must be no additions to the loan agreement, according to the rules of jurisprudence "Every receivable that brings (takes) benefit / additional / additional, then it is usury." therefore, even if it is used, the bank is very careful in its implementation because on the one hand it cannot take profits and on the other hand the bank also minimizes the risks that will occur. As for usually banks use this contract as a complementary product for customers who have proven their loyalty and loyalty that require immediate bailout funds for a relatively short period of time. The customer will return the money as soon as possible, can be exemplified: Hajj bailout loans, where prospective hajj customers are given a bailout loan to meet the conditions for depositing the cost of the Hajj trip. As a facility for customers who need fast funds while they cannot withdraw funds, for example because of deposits. As well; Islamic financing card products (Syariah charge card). As a loan to a small businessman, where according to the calculation the bank will burden the entrepreneur if given financing with a scheme of buying and selling, ijarah (wages-wages or rent), or mudharabah (profit sharing). In this case special products in Islamic banking have been introduced called Qardhul Hasan. As a loan to the bank management, where the bank provides these facilities to ensure the fulfillment of the needs of the bank's management.

a. Guarantee in Musyarakah

Musyarakah is financing based on cooperation agreements between two parties or more a particular business, where each party contributes funds provided that the benefits and risks will be borne together in accordance with the agreement. This financing product is guided by the MUI DSN fatwa No. 08 / DSN-MUI / IV / 2000 concerning Musyarakah, Bank Indonesia Regulation No. 09/19 / PBI / 2007 and Law No. 21 of 2008 concerning Islamic Banking. In implementing the Musyarakah it is commonly used in Project Financing. Musyarakah is usually applied to finance projects where sharia customers and banks both provide funds to finance the project. After the project is completed, the customer returns the funds together with the agreed results for the bank. Venture Capital In special financial institutions that are allowed to invest in company ownership, musharaka is applied in a venture capital scheme. Investments are carried out for a certain period of time and after that the bank disvests or sells part of its shares, both briefly and gradually.

b. Mudhorobah Guarantee

In classical fiqh, there is no provision even the necessity for a mudhorib to surrender a guarantee to Shohibul Maal in a mudhorobah contract. This is because, the practice of mudhorobah in the past is still very simple and of course it is still in an atmosphere of kinship and mutual acquaintance with one another. In contrast to the current reality, mudhorib and Shahibul Maal sometimes do not know from one another, even the practice of Mudhorobah has now been expanded again with the existence of intermediaries, namely the banking sector. So as to reduce the risk of moral hazard, usually in other Shari'ah banks and institutions, debtors must include their collateral. In accordance with its meaning Mudharabah is a fund investment transaction from the owner of the fund (Shahibul Maal) to the fund manager (mudharib) to conduct certain business activities that are in accordance with sharia, by dividing the results of the business between the two parties based on a previously agreed ratio. This product is guided by the DSN MUI No.07 / DSN-MUI / IV / 2000 fatwa concerning Mudharabah, Bank Indonesia No Regulation. 09/19 / PBI / 2007 and Law No. 21 of 2008 concerning Islamic Banking. In its Implementation Sharia Banks use this contract in the collection of term savings funds, namely savings savings intended for special purposes, such as hajj savings, qurban savings, deposits, and others. Special deposits (special investment), where funds are given by customers specifically for certain businesses, such as murabahah or ijarah (services) only. then in Fund

Distribution / Financing Working capital financing such as working capital for trade or services. Special investment, also called *mudharabah muqayyadah*, where special funding sources, special fund disbursement with the conditions set by the funder (Shahibul Maal).

Types of *Murabahah* in Islamic Banks *Mudharabah Muthlaqah* (unrestricted Investment Account) The owner of capital (Shahibul Maal) does not set certain limits or conditions for the manager (*mudharib*). *Mudharabah Muqayyadah* (Restricted Investment Account) The owner of a fund establishes certain restrictions or conditions for the fund manager regarding the place, method and object of investment. *Mudharabah muqayyadah* is divided into two, namely *Mudharabah Muqayyadah On Balanche Sheet*, namely the flow of funds from one investor customer to a group of business executors in certain sectors, or in certain types of contracts, (and banks bear the risk of channeling investment funds, called *Executing Agent / Executing*)) *Mudharabah Muqayyadah Off Balance Sheet*, namely the flow of funds from one investor customer to one financing customer. Banks only act as arranger (*intermediary*), (and the bank does not bear the risk, called *Channeling Agent / Channelling*). *Easyarabah Musytarakah* Is a combination of *mudharabah* contract and *musytarakah* contract). *Mudharabah Musytarakah* is a form of *Mudharabah* agreement in which the manager (*mudharib*) includes his capital / funds in the investment collaboration. Based on the fatwa of the National Sharia Council of the Indonesian Ulema Council (MUI DSN) number 50 / DSN-MUI / III / 2006 concerning the *Mudharabah* agreement *Musytarakah*.

Guarantees in *Mudharabah* Basically there is no guarantee of capital, however, so that the fund manager does not make a deviation, the owner of the fund can request a guarantee from the fund manager or a third party. This guarantee can only be disbursed if the fund manager is proven to have made a deliberate, negligent mistake or violated the agreed upon matters in the contract.

The explanation above should be used as a reference for managing the contract in the banking system, especially for Islamic banks, but it is not reflected as intended, this indicates that the codification of the Sharia Economic Law needs to be carefully regulated regarding this guarantee. If the debtor includes the guarantee while the business experiences a loss, what will the Bank or Islamic Financial Institution do with the guarantee. Given in *mudharabah* if there is a loss due to the normal process of the business, and not because of negligence or fraudulent management, the loss is borne entirely by the owner of the capital, while the manager loses the power and expertise he has devoted. If there is a loss due to negligence and fraudulent management, then the manager is fully responsible.

In the banking system like this, a legal policy is needed to regulate the second agreement between parties with the fund manager so that there is no promise (one achievement) between the two parties, and there will not be any loss in the agreement, so that the contract deemed legal.

6. Status of Usury in the Qardh Agreement

In *syari'ah* banking services or other Islamic Financial Institutions there are usually types of *qardh* loans. *Qardh* is a virtuous / soft loan without compensation, usually for the purchase of fungible goods (ie items that can be repaid and replaced according to their weight, size and quantity). While *Riba* linguistically, usury also means growing and growing so that, usury means taking extra from basic assets or capital in vanity, but in general there is a red thread that confirms that usury is an additional take, both in buying and selling transactions and borrowing in vanity or contrary to the principle of *muamalah* in Islam.

In the Codification of Sharia Economic Law, there is no mention of the legal status of usury in the *qardh* contract, on the other hand it is stated that the administrative costs in the *qardh* contract are borne by the customer without limitation. This will cause problems when creditors over-interpret administrative costs so that they can overload the debtor. So feared there will be hidden usury. In order for administrative costs not to be covered in interest, these costs may not be proportional to the loan amount.

7. Nishab in Zakah on Plants and Fruits

Nishab is the minimum amount that *zakat* must be issued. In this case the value is calculated from assets that exceed the basic needs: clothing, food, and shelter. The provisions of *nishab* are important in *zakat* because of the extent to which a person is obliged to issue *zakat*. In the Codification of Sharia Economic Law the issue of plant and fruit-fruit *zakat* rules has not yet been stipulated so that it creates a counterproductive effect on determining the minimum limits of plants and fruits that must be paid for *zakat*. While all other types of assets are mentioned. Plants and fruits are of various types. But the majority of jurists argue that there is no obligation to produce *zakat* from fruits and fruits before reaching five times. Based on the hadith, the scholars have calculated the equation of five *wasaq* (a single word from *ausaq*) with the size of the present measure, and found that the amount is equal to approximately 653 (six hundred fifty three) *kelo* grams of staple food in each country.

In Indonesia, of course with rice. Counting *nishab* on fruits, such as dates and grapes, is done by calculation after both have dried. Namely the still wet dates (*Ruthab*) become dates, and wine becomes raisins. As for calculating the number of dates and grapes before cooking, it is best to estimate them by estimation or estimation carried out by *zakat* collectors, who are experts and experienced, when the fruits begin to look perfect (before they are fully cooked).

Such an assessment aims to find out how many kilos of dates or dried grapes (raisins) will be obtained later. In order for this estimate to be known in the form of the amount of *zakat*, and how many are still the rights of the owner. It will be more complicated if the Codification of Sharia Economic Law discusses the characteristics of plant and fruit *zakat*. In order to make the Codification of Islamic Economics Law more complete.

E. Conclusion

The existence of the Compilation of *Syari'ah* Economic Law is a breakthrough and response to the needs of current economic law. When the development of Islamic economic activity in Indonesia shows a satisfying number, of course it will be accompanied by a clash of various interests. Then the Law No. 3/2008 concerning the Religious Courts came out which gave the Religious Courts the breadth to deal with *Shari'ah* economic disputes.

Based on the conditions and needs of Muslims when in various fields including economic needs, the Religious Courts began to improve and prepare material laws to resolve the Islamic economic dispute. Thus it was important that the Compilation of *Shari'ah* Economic Law was born. The existence of regulations that breathe Islam is of course an attempt to positivist Islamic law into national law.

The compilation of *Shari'ah* Economic Law is of course not a holy book, so it cannot be changed. Therefore, it can be analyzed that there are still many shortcomings that must be corrected in the Codification of Sharia Economic Law. This is something that commonly happens as happened in the past in Islam and has been embodied in the rules of *fiqh*; the law can change with changes in time, place and condition at the time of the stipulation of the law.

<http://dx.doi.org/10.29322/IJSRP.9.08.2019.p9274>

Abstract- Self-care management, including the physical and psychological aspects, affects health and wellness. In vitro fertilization, lifestyle factors affect the production of oocytes, fertilization rates, miscarriage and pregnancy. The aim of study to assess the effectiveness of the instructional program on the women knowledge undergoing in-vitro fertilization/intracytoplasmic injection about self-care management A Study and Control Groups, Pre-Test and Post-Test (Quasi Experimental Design), were used to study the Effectiveness of Self-Care Management Instructional Program on Women's Knowledge undergoing In-Vitro Fertilization , from the period of 17th September 2018 to 4th July 2019. A non-probability (purposive sample) of (60) infertile women was included in the study. The sample is distributed as the study and control groups (30 women for the study group and 30 women for the control group). The study is conducted in Al-Najaf City/Al Sadder Teaching Hospital / Fertility Center data collected through the use of a questionnaire that was design and women interview, which included demographic characteristics, reproductive characteristics, and questions about women's knowledge about self-care management. Validity and reliability of the questionnaire were identified. The data was collected through the use and application of the instructional program for the study group using lectures, booklets and videos. Data analysis was performed through the application of descriptive and inferential statistical data analysis approaches. Results revealed that 83.3% of women had poor knowledge before intervention. However, 100.0% of them had good knowledge after one month of intervention. Moreover, that the women in the study group benefited from the application of the instructional program, there was a development and improvement in all the program information and application. The study revealed that there were statistically significant differences ($p < .001$) in the study group between pre- and post-test in all items related to self-care management. The study concluded that the implementation of the educational program was effective and clearly good and improved women's knowledge and awareness. The study recommended that instruction program be developed in all fertility centers in Iraq regarding self-care management before, during and after IVF/ICSI and that the nurse must take the role in teaching the women about self-care management.

Index Terms- instructional program, self-care management, in vitro fertilization.

I. INTRODUCTION

Infertility is the impaired of ability to pregnant after a year of not protected regular sex. According researchers, it affects more than 15% of couples worldwide and is recognized as a health problem [1].

According to WHO, in developing countries, one in four couples suffers from infertility [2]. The centers for disease control and prevention (CDC, 2015) apprise that 6% of married women between the ages of 15 and 44 years in the United States of America suffer from infertility and that on 12% of women age 15-44 years. In addition in 2013 it was apprise that 7.4 million women in the United States of America had used some form of infertility treatment. Assisted Reproductive Technology comprises all fertility treatments in which both eggs and embryos are treated outside the body. In general, Assisted Reproductive therapy involves the removal of mature Oocytes from the ovaries using a thin needle, a combination of eggs and sperm in the laboratory, and the return of embryos to the woman body. And the basic form of assistive techniques was in vitro fertilization / ICSI [3].

To increase the number of patients receiving infertility treatment by assisted reproduction techniques. Modification in lifestyle factors prior to treatment can lead to a natural improvement in fertility and can reduce the requirements of in vitro fertilization treatment procedures. Recent studies indicates that infertility is also Caused due to lifestyle situation , so it is necessary to make an awareness in the young people regarding the causes & advanced treatment modalities for Infertility [4]. Most women undergoing IVF/ICSI are ready to modify lifestyle behavior and are therefore aware of the lifestyle changes they can make to enhance and improve the success of IVF [5].

While there is a great deal of health care, time and manpower in the search for and treatment of infertility, doctors ignoring the full care of the person as a whole. Factors influencing QoL quality are likely to be identified Improve care and compliance of infertile women [6]. Self-care describes the preservation of health, prevention and treatment of disease by the individual. Proving to improve patient satisfaction, quality of life. The four components of self-care lead a healthy lifestyle, treat simple illnesses, manage chronic diseases and care after leaving the hospital[7]. Moreover, there is increasing evidence that self-

care in chronically ill patients is associated with improved quality of life [8].

Self-care for women’s undergoing IVF includes lifestyle measures such as maintaining a healthy weight and nutrient intake as accurately as possible vitamin and antioxidant supplementation, as well as adhering to medication, exercise, psychological stress, Increase intake of caffeine , alcohol consumption and exposure to environmental pollutants to help women accomplish healthy Pregnancy[9].The nurse is responsible for the continuous assessment of the patient and generally begins multidisciplinary care when the physical, emotional or social conditions of the patient are required. Patient and family education and continuous self-care support are additional services provided by the nurse.

II. METHODOLOGY:

Design of the study:

A quasi-experimental design is used through the present study in order to achieve the objectives of the study. The period of the study is from 17th September 2018 to 1st July 2019.

Setting of the study:

The study was conducted in Al-Najaf City/Al-Najaf Al-Ashraf Health Directorate / Al-Sadder Medical City /fertility center.

Sample of the study:

A Non-Probability (Purposive Sample) ,consist of 60 women. The sample is divided in two groups; 30 women as study group are exposed to the instructional program, and the other 30 women not exposed to the instructional program considered as a control group.

Tools of Data Collection: It includes three main parts:

Part I: Self-administered questionnaire sheet related to socio-demographic data of the women’s:

This part is concerned with the collection of basic socio-demographic data; this part is filled by the women (age, residency, level of education, occupation status, cigarette smoker and smoking type.

Part II: Self-administered questionnaire sheet related to personal data of the women.

This part is concerned with the collection of basic personal data, this part is filled by the women (infertility type, number of IVF/ICSI cycle have you done in the past, number of abortion have you gotten due to IVF/ICSI.

Part III: Self-administered questionnaire sheet associated with self-care management on the women’s knowledge undergoing IVF/ICSI.

It is constructed to assess general knowledge of women with regard to self-care management and increasing the chances of pregnancy.. The questionnaire sheet is also complete by the women, the study purpose is explained erstwhile to get questionnaire sheet. The contributors are demanded to answer the questionnaire. This knowledge test is composed of (25) multiple choice question (in vitro fertilization description, infertility reasons and information about IVF consideration, success rate, process steps, Physical self-care, and psychological self-care). The test is covered with the relevant points from the major content area of instructional program. For the purpose of this study, the number of correct responses of the knowledge questionnaire is used as the measure of the level of knowledge. Each question is scored as the correct answer get (2) point and the incorrect answer get (1) point.

III. STUDY RESULTS:

Table (1) Socio- Demographic Data of the Study Sample NO. =60 (study and Control Groups)

Socio-Demographic Data	Rating And Intervals	Grouping	
		Study Freq. / %	Control Freq. /%
Female age / years	20-24	1	5
		3.3%	16.7%
	25 – 29	8	6
		26.7%	20.0%

Results in **table (3)** shows the women responses for questions concerning their knowledge toward self-care management at post- test for control groups whereas most they have been fail in the test. Study group of all of them (100%) are good in same test in post-test after exposed to instructional sessions.

Table (4) pregnancy test for study and control groups

Pregnancy test results	Statistical Parameters	Grouping	
		Study	Control
positive	Freq.	8	3
	%	26.7%	10.0%
negative	Freq.	22	27
	%	73.3%	90.0%
Total	Freq.	30	30
	%	100.0%	100.0%

Results in **table (4)** shows pregnancy test for (study and control groups) whereas study group (26.7%) positive after increasing knowledge and adhering of instructional program. while the control group (10%) positive.

Table (5) mean difference (independent sample t-test) between the study and control group responses at pre-test and post –test

Periods of measurements	Groups	N	Mean	Std. Deviation	t-value	d.f.	p-value
Pre-test	Study	30	1.378	.103	1.060	58	.293 NS
	Control	30	1.409	.1203			
Post-test	Study	30	1.8533	.07884	13.901	58	.001 HS
	Control	30	1.4427	.14130			

The results of **table (5)** show a highly significant difference which found between the pre-test and post-test of the study group who are participated in the instructional sessions and the control group who did not exposed to any intervention related to knowledge at p-value (0.001).

Discussion

1. Discussion of the Socio-Demographic and reproductive Data related to the Women’s undergoing In Vitro Fertilization / ICSI:

the present study highlights the contributions of some demographic variables for women who review the fertility center in Najaf, most of them aged (25-29 , 30-34 , 35-39) 26% of the

study group and (30-34) 30% of the control group. This result corresponds to the Omu and Alexander (2010) conducted in Kuwait, where it showed that the age of 20-29 years old is the dominant age[10]. .This results may come because women in this age are more likely to be pregnant and this age group is a preferable for pregnancy, so they seeking for fertility treatment. also our study is agree with the study of Dunson and other in 2004 Women aged 19–26 years had significantly higher probabilities of pregnancy than women aged 27–29 years . Women aged 30–34 years were similar to the 27 to 29-year-olds, but women aged 35–40 years had further reductions in their probabilities of pregnancy [11].

Age of male is expected to negatively affect semen quality. Testicular changes in age are associated with a lack of T levels. In this study, a high percentage of the study group was found in control of men between the ages of (30, 34 and 40 +) This is consistent with Mehdi in 2007, indicating a decrease in the parameters of sperm and semen with age, decrease of movement of Sperm in general by 7% / year with a decrease in the size of sperm by 3.1% / year as the volume of semen decreases 10% at the age of 30 years so the patient should be aware of each of the factors mentioned [12].

In terms of residence, the study shows that a high percentage of the study group (60%) and the control group (80%) live in urban areas. This is in agreement with Abdullah in 2016, indicating that 72% of them live in urban areas. This result matches with the result of Saoji (2014) who mentioned that most study group are living in urban residential area, while most control group are from rural area. This result may come due to women who live in urban more vulnerable to pollutants and chemicals such as; polluted air from factories, vehicles and electric generators. In addition, frequent use of detergents, cosmetic and pesticides [13][14].

With regard to the level of education, the study revealed that the highest percentage of the study sample of the two groups control and study are middle school graduates. This may be because most of the women have not been able to complete their education because of the circumstances and the nature of our Iraqi society. In addition, this result may be due to the continuing economy, political crises and wars that our country suffered from the beginning of the 1980s until this time. Asmail and Moussa 2017 noted that highly educated women are more likely to use problem-focused approaches, such as doing something about a problem, identifying the cause, thinking about the situation, and looking for information. relatively high levels of education are associated with positive health behaviors and can lead to the assumption of more adaptive coping strategies [15].

The current study indicated that the highest percentage of women in the study group 86% and the control group 90% are housewives. These results are consistent with those of AbudlAzeed *et al.*, (2019), where the majority of the 82% of women are housewives and have no personal income. These results are related to our communities that encourage females to be housewives and care for their families and their children. This result is due to the lack of government jobs in the country and no other source of financial support. These results coincide with Hamad's (2009) For females are housewives and their husbands are self-employed. For working women, chemicals can be inhaled either through environmental exposure or potential exposure in the workplace [16].

With regard to smoking and passive smoking, most of the study sample of the two groups control and study are non-smokers but are highly exposed to secondhand smoke, and this result agrees with Amirkhani and others. (2014) as well as Abdullah (2016), who stated that "the high percentage of the study group and the control group are passive smokers." The proportion of smokers in women of childbearing age has increased significantly in the last 30 years (WHO, 2007). Unfortunately, most women are unaware of the relationship between smoking and infertility (Ruth and Taylor, 2001). The relationship between smoking and infertility in women has been discussed in many studies. Cigarette smoke

contains many toxic substances known to be related to fertility, endocrine disorders, and onset of early menopause, early ovarian failure, and reduced rate of implantation (ASRM, 2018). Thus, cigarette smoking can lead to a bad diagnosis of assisted reproductive technologies [17][18][19][20].

2. Discussion of the assessment of the study sample responses at the pre-test and post-test for both study and control groups Related to the Women's undergoing In Vitro Fertilization / ICSI:

After implementation of the instructional program for the study group improved their knowledge about self-care management and increased their interest in adjusting their lifestyle to increase the chance of pregnancy. These results are consistent with a study carried out by Neamah and others (2018) in Iraq / Baghdad where Neamah said that results in both groups (study And control) in the pre-test have low knowledge about fertility and artificial insemination. After the implementation of the educational program of the study group, the couple to improve knowledge about artificial insemination. This study shows the importance of the educational program on knowledge of infertile couples who have increased knowledge of infertile couples after the implementation of the educational program [21].

3. Discussion of the Pregnancy Test for Study and Control Groups:

In this study, the adherence to the guidelines of the program on self-care management for women undergoing IVF/ICSI increases the chances of pregnancy and the success of the IVF process. Within a month of follow-up with each woman, the results showed that the group that underwent instruction sessions achieved pregnancy by a percentage of 26.7%. Commitment and instruction have a potential effect of reducing stress and increase the chance of pregnancy potential because the intensity and tension greatly reduces the probability of pregnancy and there are further reviews prove this and this is consistent with the results of Boivin and de Liz and Strauss, which investigated the effectiveness of psychological interventions for infertility also, The results of the systematic review and meta-analysis conducted by Hammerli *et al.*, which analyzed the effectiveness of psychiatric interventions for infertile patients, suggest that psychological interventions such as instruction, educational intervention and relaxation improve the chances of some patients becoming pregnant and having a significant impact on pregnancy rate. The results of a study conducted in Iran in 2017 on 1079 infertile women that there is a positive impact of counseling on pregnancy rate $p : 0.00$ [22][23].

4. Discussion the effectiveness of the instructional program on the knowledge of women undergoing IVF/ICSI self-care management for study and control groups

Table (6) presents highly significant difference between the results of the post- test of the study group and the control group that demonstrates the effectiveness of the instructional program in self-care management for women. The study of self-care was associated with a significant increase in knowledge and positive attitudes in the intervention group, This study was agreed with a study conducted at Kamal Al-Samarae Hospital in Baghdad by Neamah and others in 2018. It explained that the implementation

of the educational program increases and improves the knowledge of infertile couples towards artificial insemination . There is a statistical significance between the knowledge about artificial insemination of the study groups and post-test observation, and in another study conducted in Egypt in 2018 on 100 infertile women as it revealed that 49.0% of women had weak knowledge before intervention. However, 73.0% of them had good knowledge after one month of consecutive intervention. In addition, there was a statistically significant relationship ($P < 0.01$) between the sex function scores of infertile women before and one month of intervention. Also, only 4.0% of the women studied had a positive attitude towards adaptation to infertility before intervention. At the same time, after one month of intervention, the positive attitude changed to 92.0%, respectively[24] .

IV. CONCLUSION:

In the light of this study, we can conclude that there has been a significant improvement in women's knowledge, practices and attitudes regarding self-care management after the instructional program. There was a positive correlation between women's knowledge and attitude before and after intervention. In addition, given the hypothesis of the alternative study to predict the positive affected of the program's effectiveness on self-care management on the women's knowledge undergoing IVF/ICSI, as demonstrated by this effect, there is no evidence of acceptance of the null hypothesis. Otherwise, the alternative hypothesis is accepted.

V. RECOMMENDATIONS:

1. All fertility centers in Iraq should include an instructional program of self-care management for women undergoing IVF
2. Using different types of mass media to increase women awareness about advance maternity treatment for infertility
3. Conduct training programs for all nurses in fertility centers to enable them to educate women about infertility treatments and self-care management.
4. Further studies should be made to find the national prevalence of infertility among Iraqi women for infertility treatment and self-care management.

Abstract- The study is a descriptive and analytic study was carried out to find out the impact of exercise during pregnancy on fetus and maternal outcomes, and to determine the statistical significant differences between exercise and pregnancy outcomes. A purposive sample of (100) pregnant women was selected from Al-Zahraa Teaching Hospital in Al-Najaf Al-Ashraf governorate. Data was collected through the interview of pregnant women. Questionnaire format was designed and contained four parts, demographic variable, reproductive variable, newborn variable, pregnancy physical activity questionnaire for pregnant women. Validity and reliability of the questionnaire were determined by conducting a pilot study. Descriptive and inferential statistical procedures were used to analyze the data. The result of the study revealed that the highest percentage of the age of mother was ranged between (21-25) years, the highest percentage of them were institute graduated and above, most of them were housewives with sufficient economic status. The result indicate that there are significant relationship between exercise and demographic characteristics (age of mother, economic status, level of education, occupation), significant relationship between exercise and reproductive history (parity, mode of delivery, number of alive children), non-significant relationship between exercise and complication during and after pregnancy, and significant relationship between exercise and newborn history (weight of baby).

Objectives: To assess exercise during pregnancy through application of Pregnancy Physical Activity Questionnaire PPAQ, to assess fetal and maternal outcomes, to determine the impact of exercise on fetal and maternal outcomes, and to determine the factors affecting fetal and maternal outcomes such as demographic data and reproductive history.

Recommendation: Encourage the pregnancies women on the exercise during pregnancy especially in the third trimester, and establishing program about sport club to teaching pregnant women the type of exercise during pregnancy that is important to reduce the proportion of caesarean section.

Index Terms- exercise, pregnancy, fetal and maternal outcomes.

I. INTRODUCTION

Every year, 125 million women are pregnant (1). Pregnancy is a period of increased wellness and health care awareness. Thus, Pregnant are more likely to make changes in lifestyle that really can lead to better health behavior. The advantages of these

changes not only impact the mother's health, but also the mode of delivery and the well-being of the newborn (2). Pregnancy is an important stage in women's lives where it is the time when many social, mental, behavioral and physiological changes occur (3). In women's lives, Gestation presents psychologically and physical changes that really can impact the awareness of the individual living standards. Furthermore, several pregnant women feel unappealing and heavy, and could also find it difficult with certain motions and regular daily activities (4). exercise is one of that important factors that helps pregnant women to give birth naturally and enhance the health of the mother and the child, and the exercise can be prepared by pregnant before and during pregnancy (1). Labor is painful, and for most pregnant women the onset is full of fairness. Moreover, women often experience perineum trauma while giving birth. Some studies suggest that the physical activity of the mother may lead to shorter labor, less medical procedures, as well as less labor exhaustion. Been in shape doesn't decrease pain, but it certainly helps to give you the stamina you need to get through labor (5). On the other hand, Women often experience perinea trauma at birth, particularly through their first delivery. The trauma of perineum is defined, either spontaneously or due to an episiotomy, Like any genital harm during childbirth. In its extent, episiotomy is equivalent to a spontaneous perinea tear of the second degree. Perinea trauma is correlated with short-term and long-term morbidity during childbirth. Injure to perinea can lead to urinary and fecal incontinence, painful contact, constant perinea pain, and weakness of the pelvic muscles. It has been shown that an episiotomy is not only un successful but also dangerous at times. Potent proof is now well established to support restricting the use of episiotomy. However, more than half of the females who give birth without the need for an episiotomy still are suffering from a wound which really requires multilayer closing. Treatments are required to reduce the danger of episiotomy and perineal tears. In addition, Females with undamaged perineum recorded fewer perineal pain directly following delivery and enhanced sexual performance three months after delivery (5). Physical activity during pregnancy can make a positive contribution to perineal trauma. Many trials have also shown that a woman or her partner performed a perineal massage a few weeks before delivery to elevate elasticity and minimize the risk of episiotomy trauma or accidental tears (5). There are controversies about the practice of leisure time and the outcome of pregnancy. Some research has shown that exercise during pregnancy can affect maternal outcomes positively (6). Some trials have verified that exercise may lower the risk of cesarean section during pregnancy (6). Over

the previous two decades, there has been growing interest in the potentially positive impacts of regular exercise during childbirth for both mom and children (7). Many writers have noted that exercises can encourage those advantages in reproductive results, such as reduced cesarean sections, reduced gestational diabetes mellitus incidence, and reduced gestational weight gain. Furthermore, fetal advantages include reduced fat mass, increased tolerance of stress and sophisticated neurocognitive development (7). Most women think that when they spend their free time lying down and not Having any habits or physical activity that will positively affect the results of their pregnancy , this issue has stirred up controversy , researchers have conducted studies proving that exercise may positively affect pregnancy outcomes (8). newly many research had suggested to doing daily physical activity during pregnancy, the researchers detect that the exercise has positive effect on the pregnancy outcome especially mild to moderate types during their final month of pregnancy and advice the pregnant women to doing it without any harmful effect (9) . it is still recommended by guidelines for the pregnant women to do some physical activity for 150 min / week . in spite of these recommendations, it is estimated that less than 15% of pregnant women are eager to do that (10).

II. METHODOLOGY

Design of the study: A cross-sectional retrospective study design was conducted to achieve objectives stated before. During the period from 1th February 2019 until 25th February 2019.

Setting of the study: The study was done in Al-Najaf City/ Al-Najaf Health Directorate/ Al-Zahraa Teaching Hospital.

Sample of the study: A non-probability (Accidental Sample) of 100 mothers will include in the study.

The Instrument of the Study: The final form of the instrument of the study consists of four parts:

Part 1: Demographic Data: A socio-demographic data consists of (7) items, which they are age, residence area, occupation, economic status, level of education, body mass index and smoking.

Part 2: Reproductive history: A reproductive history consists of (11) items, which they are age of marriage, infertility period, gravidity, parity, abortion, mode of current delivery, if cesarean section what indication of it, obstructed labor, prolong labor, number of alive children, complication of current pregnancy, chronic diseases during current pregnancy, complication after pregnancy.

Part 3: Clinical data about the current neonate: It is consisting of (4) items, which they are if the baby alive or dead, birth weight, gestational age, APGAR score.

Part 4: Exercise questionnaire (pregnancy physical activity questionnaire): They were (31) question that are used to assess pregnancy physical activity at three domains (at home, going place and exercise for fun or for exercise, at work).

III. STUDY RESULTS:

Table (1) Distribution of study Sample according to Demographic Data

Demographic Data	Rating and Intervals	Frequency / Percentage
Age / years	<= 20	20
	21- 25	30
	26- 30	26
	31- 35	17
	36 and more	7
	Total	100
Residence area	Urban	80
	Rural	20
	Total	100
Occupation	Housewife	68
	Employee	21
	Student	11
	Total	100
Economic status	Sufficient	87
	Sufficient to some extent	11
	Insufficient	2
	Total	100
Levels of education	Doesn't read and write	8
	Read and write	16
	Primary school graduated	20
	Secondary school graduated	22
	Institute graduated and above	34

	Total	100
BMI	Underweight	2
	Normal	63
	Overweight	35
	Total	100
Smoking	Active	17
	Passive	46
	Un exposed	37
	Total	100

Table(1) clarifies the demographic data of a total of (100) pregnant who enrolled in the study the high percentage of women at age group between (21-25) (30%), majority of them (80%) live in urban residential area, housewife (68%), socio-economically are sufficient (87%), Institute graduated and above (34%), normal BMI (63%) , and (46%) of study sample about smoking are passive .

Table (2)) Distribution of study Sample according to Reproductive History

Reproductive history	Rating and Intervals	Frequency / Percentage
Age of marriage / years	<= 15	8
	16- 18	24
	19- 21	40
	22- 24	23
	25+	5
	Total	100
Type of Infertility	None	86
	Primary	9
	Secondary	5
	Total	100
Gravidity	<= 3	73
	4- 6	24
	7+	3
	Total	100
Parity	<= 3	84
	4- 6	14
	7+	2
	Total	100
Number of Abortion	None	75
	1- 2	25
	Total	100
Mode of delivery	Normal delivery	74
	Caesarean section	26
	Total	100
Type of Cesarean section	Emergency	15
	Elective	11
	Total	100
Obstetric labor	No	83
	Yes	17
	Total	100
Prolonged labor	No	85
	Yes	15
	Total	100
Number of a live children	1-3	84
	4-6	14

	7+	2
	Total	100

table (2) shows that the reproductive history of (100) pregnant who enrolled in this study. In related to the age at marriage the high percentage of pregnant women between (19-21) years old where (40%) , the majority of pregnant are (86%) for none Infertility period , (73%) of gravidity are (less than or within 3) , (84%) of parity are (less than or within 3) , (57%) with no abortion, (74%) with normal delivery, (15%) of Cesarean section causes are emergency , (83%) are no Obstetric labor , (85 %) are no Prolonged labor and (84%) of study sample are having (1-3) children.

Table (3)) Distribution of study Sample according to Complications and Chronic Diseases

Complications and chronic diseases	Rating	Frequency Percentage /
Complications of current pregnancy	None	60
	Anemia	7
	Anemia + Oligohydrominious	2
	Anemia + Oligohydrominious + Cervical incompetency	1
	Anemia + Cervical incompetency	3
	Anemia + Antepartum hemorrhage	1
	Anemia +HT+GDM	1
	Anemia + GDM	2
	Oligohydrominious	1
	Oligohydrominious + Cervical incompetency	1
	Cervical incompetency	10
	Cervical incompetency + HT	2
	Cervical incompetency + GDM	2
	Antepartum hemorrhage	5
	Pregnancy induced hypertension	1
	HT + GDM	1
Total	100	
Chronic diseases during pregnancy	None	96
	Chronic hyper tension	1
	DM	3
	Total	100
Complications after delivery	None	75
	Bleeding	17
	Bleeding + Pre-eclampsia / eclampsia	6
	Pre-eclampsia / eclampsia	2
	Total	100

Table (3) show the majority of study subject of complication of current pregnancy are (60%) none , (96 %) not having any chronic disease during pregnancy ,and (75%) not having any Complications after delivery.

Table (4)) Distribution of study Sample according to Neonate Clinical Data

Clinical data	Rating and Intervals	Frequency / Percentage
Baby conditions	A live	100
	Dead	0.0
Baby weight / kg	<= 3	34
	3.01+	66
	Total	100
Gestational age / weeks	<= 31	5
	32- 34	3
	35- 37	20
	38- 40	61
	41+	11
	Total	100
Apgar score	Low	0.0
	Moderate	20
	High	80
	Total	100

Table (4) clarifies the neonatal clinical data , where most of them (100%) of baby condition are live, the majority of neonate are (66%) for baby weight are (3.01 and above) kg, (61%) of gestational age are within (38-40) weeks, and (80%) are high level of apgar score .

Table (5) assessment of exercises

Main domain	Levels of exercises	Frequencies / percentages
At home	Mild Exercise	51
	Moderate Exercise	30
	Hard exercise	19
	Total	100
Going Places	Mild Exercise	100
	Moderate Exercise	0.0
	Hard exercise	0.0
	Total	100
At Work	Mild Exercise	97
	Moderate Exercise	2
	Hard exercise	1
	Total	100

table (5) summarizes that the assessment of each domain in the exercise scale for the pregnancy every domain assessed as mild exercise.

Table (6) overall assessment of exercises

Main domain	Levels of exercises	Frequencies / percentages
Overall assessment of pregnancy exercises	Mild Exercise	93
	Moderate Exercise	3
	Hard exercise	4
	Total	100

Table (6) shows that the overall assessment of exercise for pregnant women is mild with the percentage (93%).

Table (7) relationship between the overall assessment of exercises and the mothers' demographic data

Demographic data	Chi-square Value	d.f.	p-value
Age / Years	22.038	8	.005 HS
Residence Area	5.108	2	.078 NS
Occupation	12.814	6	.046 S
Economic Status	18.095	4	.001 HS
Levels Of Education	18.719	8	.016 S
BMI	5.975	4	.201 NS
Smoking	6.316	4	.177 NS

Table (7) presents highly significant relationship between exercise and the age and economic status at p-value less than 0.01, and significant relationship between exercise and level of education and occupation at p-value less than 0.05, On the other hands there is a non-significant relationship with other demographic data.

Table (8) relationship between the overall assessment of exercises and the mothers' reproductive history

Reproductive history	Chi-square Value	d.f.	p-value
Age Of Marriage	6.837	8	.554 NS
Gravidity	9.946	4	.041 S
Parity	19.710	4	.001 HS
Number Of Abortion	2.509	2	.285 NS
Mode Of Delivery	7.232	2	.027 S
Obstetric Labor	1.542	2	.463 NS
Prolonged Labor	1.328	2	.515 NS
Number Of A Live Children	19.710	4	.001 HS

table (8) presents a highly significant relationship between the exercise and the parity, number of a live children at p-value less than 0,01 , and significant relationship between the gravidity, mode of delivery at p-value less than 0.05, On the other hands there is a non-significant relationship with other reproductive data.

Table (9) relationship between the overall assessment of exercises and the complications and chronic diseases

Complications and chronic diseases	Chi-square Value	d.f.	p-value
Complications of the current pregnancy	37.027	30	.176 NS
Chronic Diseases	.314	4	.989 NS
Complications after delivery	4.226	6	.646 NS

Table (9) presents no significant relationship between exercise and the complication and chronic disease during pregnancy.

Table (10) relationship between the overall assessment of exercises and the neonate clinical data

Clinical data	Chi-square Value	d.f.	p-value
Baby Weight / kg	6.158	2	.046 S
Gestational Age / weeks	6.899	8	.548 NS
Apgar Score	.420	2	.811 NS

table (10) presents a significant relationship between exercise and the baby weight at p-value less than 0.05, On the other hands a non-significant relationship with other neonate clinical history.

Table (11) Correlation between the mothers' exercises and some significant associated variables

Overall assessment of exercises	Number of a live children	Gravidity	parity	Baby weight
Pearson Correlation	.369**	.325**	.369**	.094
p-value	.000	.001	.000	.353
N	100	100	100	100
**. Correlation is significant at the 0.01 level (2-tailed).				

Table (11) presents a highly significant correlation between the exercise and the Number of a live children , Gravidity, parity at p-value (0.001),and significant correlation between exercise and baby weight at p-value (0,01).

Table (12) mean difference (independent sample t-test) of the pregnant exercises and the mode of delivery

Mode of delivery	N	Mean	Std. Deviation	t-value	d.f.	p-value
Normal	51	35.5882	9.60245	1.254	98	.213 NS
CS	49	33.3265	8.36508			

Table (12) shows that there is a non-significant difference in exercise according to the mode of delivery at p-value more than 0.05. but regarding to the mean difference that study results indicate that the pregnant with normal delivery perform exercise more than those pregnant with CS.

IV. DISCUSSION:

5.1. Demographic data of the pregnant women: The current study included a total number of (100) pregnant women who participate in this study, their percentage age was 30% with the most age group of the participant were (21-25) years, same result by (11) who did find that ages between (21-25) are the most age group among participants . Furthermore, most percentage 80% of participants were living in an urban area, this result matches with the result of (12) who mentioned that most participant are living in urban residential area. Moreover, most of participant was housewives by 68%. This result comes along with (13) housewives were the major group of the participant. Regarding socio-economic status, high percentage of study sample are with Sufficient socio-economic status by 87%. this result

matches with the result of (14) who stated that the majority of the participants having sufficient socio-economic status. In addition, the levels of education for 34% of the participants was Institute graduated and above. Body mass index for the 63% of the pregnant women is between (20-25) which is considered normal (15). in their study which indicated that the majority of participant are with normal weight. And about smoking of 46% of the pregnant women is passive. This result agrees with (13) who reported that "High percentage of participants are passive smokers"

5.2. Data related to reproductive history of the pregnant women: Highest percentage 30% of age of marriage is between (21-25) years, in addition the most of the participants were non infertility period by 86%. Moreover, to that most of participant show the majority of the gravidity was less than or within 3; less than or within 3 parity. These results are supported by (14) their

results show that most of the subjects of the study are multigravida and multipara. In addition, this study shows that most study samples do not have abortions by 75%. This result supported by (13) they state the highest percentage of participated women are without case of abortion. In addition, the majority of the last delivery method for these participants was vaginal delivery compared with caesarean sections by 74%. This result agrees with (16) they mentioned that the majority of study sample was normal vaginal delivery. In addition, the majority of these participant was non-obstetric labor by 83%, and the majority of these participant was non prolonged labor by 85%. Moreover, to that most of participant show the majority of the number of a live child 1-3 by 84%.

5.3. Data related to Complications and Chronic Diseases: Majority of the participants are with no complications of current pregnancy such as (Anemia, Oligohydramnios, cervical incompetence, Antepartum hemorrhage, Pregnancy induced hypertension, Gestational diabetes mellitus) by 60% as of what has been found by this study, which in consistency to (17),(18) these studies found that their pregnant women have no complications during pregnancy period. Moreover, to that the majority of these participants are with no chronic diseases during pregnancy such as (Thyroid disease, Chronic hypertension, Heart disease, Asthma, Diabetes mellitus) by 96%. This result comes along with (18) they stated that the majority of participants are with no past medical history In addition, the majority of these participant are with no Complications after delivery such as (Bleeding, Pre-eclampsia or Eclampsia, End organ, Embolism) by 75%.

5.4. Data related to Neonate Clinical Data: Study results show that all neonate is alive by 100%, in addition, the majority of baby weight are above (3.01+) by 66%, and the majority of Gestational age are from (38 to 40) weeks by 61%. these results agree with (19) in their study which indicated that the majority of gestational age more than 36 weeks, all of birth are alive, and birth weight from 2.5-4.5, moreover, the majority of the Apgar score of the neonate is 80% high.

5.5. Assessment of the exercise of the pregnant women: From the (31) question about the pregnancy physical activity questionnaire, these questions are divided into 3 domain and the assessment of each domain in the exercise scale for the pregnancy every domain assessed as mild exercise.

5.6. The overall assessment of exercise : The overall assessment of pregnancy exercises is mild with percentage 93% as what mentioned earlier, the reason of this result is maybe due to that the majority of participants(68%) were house wives and they are doing housekeeping works and the lower level of education is the most important factor as the majority of the women were (66%) secondary school graduated and lower level of education so that is a reasonable result Fell, et al., 2010 ; Mudd, et al., 2010 ; Peterson, et al., 2006 ; Ning, et al., 2004 ; Rutkowska, et al., 2003, these researchers are agree and had conclude same point that the lower level of education is an important and effective factor participating in mild level of exercise (20),(21),(22),(23),(24) .

5.7. The relationship between the overall assessment of exercises and the mothers' demographic data: There is a high significant relationship between the exercise and the age of mothers, previous studies supported this result, these studies indicated that high level of exercise was associated with younger

age (25),(22) . There is significant relationship between exercise and occupation of the pregnant women's, this result is supported with some previous studies, like cross-sectional study which find that in comparison women who were not employed were more likely to be meeting exercise guidelines according to employed women (22) . On the other hand, a different study concluded that the women who are housewives and don't have a job are less practicing aerobic exercises than professionals' women in addition, professional women are practicing aerobic exercises for about twenty mints and more for 2 days per week and the percentages were about (42% for professionals women vs 22% for nonprofessionals women) (26) . The rest researches find no relationship between exercise and employment. (20), (27) found there is no relationship between exercise and occupation of the pregnant women. There is a high significant relationship between exercise and socioeconomic status , a study by (28),(22),(23),(29) found that there is appositve relationship between exercise and the economic status , referred that pregnant with high income households are more likely to be active. There is a significant relationship between exercise and the level of education , the pregnant women who have Institute graduated and above doing exercise during pregnancy , this is supported by some study (20), (22),(23),(21)(24) concluded that Increased level of education (e.g., high school, college or university) has been found to be an important predictor of increased participation in exercise. There is non-significant relationship between exercise and BMI of the pregnant women, this supported by some study (28),(27),(23),(30) found that there is no relationship between exercise and weight or BMI of pregnant women.

5.8. The relationship between the overall assessment of exercises and the mothers' reproductive history: There is a significant relationship between exercise and gravidity, also there is a high significant relationship between exercise and parity, this supported by some study, (28) find that higher level of exercises can be predicted and found if the women has at least one child in the house. There is a significant relationship between exercise and mode of delivery. This supported by a study, which it concluded that physical exercise increase frequency of the normal vaginal delivery and it will be more effective when the exercise is in the second and the third trimester for that It can be prescribed for health women while it was pregnant or not (31). There is a high significant relationship between exercise and number of alive children, this supported by a study that find the women have children in home are using and spending higher level of energy than the women who have no children especially in the fourth and seventh months of pregnancy. (28)

5.9. The relationship between the overall assessment of exercises and the neonatal clinical data: Wiebe et al., 2015 shows that there is a significant relationship between the exercise and the baby weight, (32) study concluded that exercise and activity provide protect infant birth weight from being overweight or low birth weight.

5.10. The correlation between the mothers' exercises and some significant associated variables: There is a high significant correlation between the exercise and the Number of a live children, there is significant correlation between exercise and baby weight, (32) researchers concluded that using scheduled exercise will have great and effective on the birth size and weight.

5.11. The relationship between the overall assessment of exercises and the mode of delivery: There is a non-significant difference in exercise according to the mode of delivery, but with respect to the mean difference that study results indicate that the pregnant with normal delivery perform exercise more than those pregnant with CS. This supported by Rajabi A *et al.*, 2018, study results clarify that exercises and activities are participating greatly in normal vaginal delivery and reduces the probability of cesarean section in addition, these result have great deal in providing a solid base for convincing staff members of health care system to provide a standard and regular physical activity and exercise (33).

V. CONCLUSION

1.The study confirms that the majority of pregnant women are from (21-25) years , urban residency, occupation is a housewife level of education is graduated from institute and above, sufficient economic status and normal body mass index, the study confirm that the majority of pregnant women are having 3 and above children and the majority of mode of last delivery is the vaginal delivery, also the majority of baby weight and APGAR score is normal , There were high significant relationships between The age of mother and exercise, there were high significant relationships between the economic status of pregnant women and exercise, there were significant relationship between the level of education of pregnant women and exercise, there were significant relationship between the occupation of pregnant women and exercise, there were non-significant relationship between the exercise and the body mass index of the pregnant, there were high significant relationships between the exercise and the number of parity and number of a live children, there were significant relationships between the exercise and the number of gravida and mode of delivery, there were significant relationships between the exercise and the baby weight, there were a non-significant difference in exercise according to the mode of delivery at p-value more than 0.05. but with respect to the mean difference that study results indicate that the pregnant with normal delivery perform exercise more than those pregnant with CS.

VI. RECOMMENDATION

Encourage the pregnancies women on the exercise during pregnancy especially in the third trimester.

Establishing program about sport club to teaching pregnant women the type of exercise during pregnancy that is important to reduce the proportion of caesarean section.

Further studies should be made to find the national prevalence of pregnant women made exercise during pregnancy and effect on outcomes

Emphasizing on a collaborative work between Iraqi ministry of youth and ministry of health to include this exercise curriculum a knowledge regarding type of exercise during pregnancy such as yoga ball .

Using different types of mass media to stimulate public awareness about benefit of using exercise during pregnancy.

Abstract

This article is based on the thesis of the Surabaya State University Social Sciences Education Science Master's Program (2019), "*Implementation of Minang Culture Local Wisdom Dima Bumi Dipijak, Disitu Langit Dijunjuang: Ethnopedagogy Studies Of The Minang Diaspora In The City Of Surabaya.*" This research is qualitative in nature with an ethnographic approach that was carried out for three months (August-October 2018) to Minangkabau migrants in the city of Surabaya. The aim of the study was to understand how the application of Minang Culture Local Wisdom values "*Dima Bumi Dipijak, Disitu Langit Dijunjuang*" (where he earth is stepped on, there the sky is upheld) in the Context of Ethnopedagogy by Perantau Minang in the City of Surabaya. The results of the study show that there are at least five Minangkabau cultural values that are very important to be included as part of the ethopathic material. The nine cultural values are:

- a) Caring for and maintaining Mother Language.
- b) "*Dima bumi dipijak, disitu langit dijunjuang*".
- c) "*Nan elok dek awak katuju dek urang; Lamak dek awak lamak dek urang; Sakik dek awak sakik dek urang*".
- d) "*Karatau madang di hulu, Babuah babungo balun; Marantau Bujang dahulu, Di rumah baguno balun*".
- e) "*Baraja ka na manang, mancontoh ka nan sudah*"; dan "*Takuruang nak dilua, taimpik nak diateh*".
- f) "*Yang buta penghembus lesung, yang pekak pelepas bedil, yang lumpuh penghuni rumah, yang kuat pemikul beban, yang bodoh untuk disuruh-suruh, dan yang pintar lawan berunding.*"
- g) "*Hiduik baraka, baukue jo bajangko*".
- h) "*Nan tuo dihormati, nan ketek disayangi, samo gadang bawo bakawan, ibu jo bapak diutamakan.*"
- i) "*Adat basandi syarak, syarak basandi kitabullah*"

Keywords: *ethnopedagogy, local wisdom, Minangkabau culture.*

I. Introduction

Every society in any culture has a life philosophy as local wisdom which becomes a reference in thinking, acting and behaving in its social life. The Minangkabau community in West Sumatra has been known to adhere to a kinship system according to the matrilineal kinship system. One of the cultural consequences is requiring men to migrate starting after graduating from junior high school or senior high school. Going around is the most ideal way to achieve maturity and success. By wandering not only to gain wealth and knowledge but also to gain prestige and personal pride (Hastuti, 2015: 3).

As nomads, they must implement Minang cultural values, especially "*Dima bumi dipijak, disitu langit dijunjuang*" (where the earth is stepped on, where the sky is upheld). Where and wherever the Minangkabau migrate must react and adapt the local social environment. Other cultural consequences of the matrilineal kinship system, each *kamanakan* (children of the maternal line) must be guided by *mamak* (a mother's brother) especially in terms of care, education, and all other aspects of life. Fathers only function and play a role in supervising their children: children on the lap, *kamanakan* guided (Amir: 2014; Amir: 2000; Thaher: 2006; Kato: 2005).

The problem of this study is: how to apply the values of the Minang Cultural Local Wisdom "*Dima bumi dipijak, disitu langit dijunjuang*" in the Context of Ethnopedagogy by Minang Diaspora in the City of Surabaya?

The aim of the study: to understand how the application of cultural wisdom to the local wisdom of the Minang culture "*Dima bumi dipijak, disitu langit dijunjuang*" in the Ethnopedagogy context of Minang Diaspora in the city of Surabaya.

II. Theoretical Framework

1. Definition of Cultural Philosophy "*Dima bumi dipijak, disitu langit dijunjuang*".

The cultural philosophy "*Dima bumi dipijak, disitu langit dijunjuang*" and a proverb "elok-elok manyubarang, jan sampai titian patah, elok di rantau urang, jan sampai babuek salah": "*baso-basi, malu jo sopan*" and "*tenggang raso*" (Demina, 2016: 8) (do good in people's countries not to do wrong, do not have words or behavior that can offend or hurt people's feelings). All social ethics are very closely related to the values of Islamic teachings originating from the Al-quran and Hadith, namely "*adat basandi syarak, syarak basandi kitabullah*" (Rahim, 2017: 64-72).

2. Parenting Theory and Educating Children.

Cummins and McMaster (2006), as quoted by September (2015: 1), say that "The wealth of a nation is the health of children". The resilience of the nation's future depends on the quality of the children who at this time must obtain care, guidance, protection, and education and are of the right quality. All of these are the duties and obligations of parents.

The Indonesian government has issued Law No. 23 of 2002, in article 26 concerning Child Protection, that: (1) Parents are obliged and responsible for: caring for, nurturing, educating and protecting children; grow children according to their abilities, talents, and interests; and prevent the occurrence of marriage at the age of children. (2) In the event that a parent does not exist, or is not known to exist, or for some reason, is unable to carry out his obligations and responsibilities, then the obligations and responsibilities referred to in paragraph (1) can be transferred to the family, which is carried out according applicable legislation.

Article 26 in Law no. 23/2002 paragraph (1) stated normatively that the purpose of caring, protecting and educating children is to fully develop the abilities, talents, and interests of children. These goals, in September's view (2015: 2-3), basically mean that the duties and obligations of parents in the context of parenting are so that each child has cognitive, emotional, and social quality competencies.

These three things are influenced by (1) family income sources; (2) style of parenting; and (3) family education level. September said that parenting style has a fundamental influence on children's development and their interactions between parents and children during the early stages of child development (ECD, early childhood development). This view generally applies to the people who adhere to the kinship system following the male and female lines (patrilineal and matrilineal kinship system).

Some of the results of previous studies indicate that at present there is a shift and change regarding the function and role of the *mamak* towards his nephew which is no longer in accordance with the cultural values or customs of the Minangkabau (Derby, 2017: 12). Another study concluded that a father who was initially more instrumental and functioning as a *mamak* in guiding his nephew from the mother's family had experienced a shift, namely acting and being responsible for his own family (Usmarni and Rinaldi, 2014: 48).

Another study is a change in the pattern of communication among family members (especially between children and parents - father and mother, and vice versa) that is strongly influenced by the use of new media (internet, and other social media). This change in turn affects the parenting style of both parents, meaning that the planting of values to children is no longer solely carried out by their parents, but shifts to the new media (Yunarti, Rahmadani, 2017: 64).

The *mamak* from the Minang nomads in the city of Surabaya geographically do not gather with their *kamanakan*. This condition causes the role and function of the *mamak* in the context of nurturing, guiding, educating, and the like that cannot be done fully. Therefore, family roles and functions are important to fill the empty roles and functions. According to Galovan's family systems theory (2016: 2-3), the quality of father-child relationships correlates with the quality of parental marriage relationships. Quoting the opinion of Baumrind (1967) and Maccoby and Martin (1983), Dinn and Sunar (2017: 111), states that this quality must be seen from the way parents apply parenting and mentoring and educate their children whether it is authoritative (authoritative), authoritarian (authoritarian), or permissive and neglecting.

According to Chrisiana (2006), as quoted by Handayani (2016: 63) there are at least five types of personality that can be formed through family education, namely: (1) trustworthiness; (2) fairness; (3) caring; (4) respect; (5) responsibility. Furthermore, Ayu, et al (2012) states that the formation of good morals in children needs to be considered from the beginning. Family support is important for children in the learning process. Parental assistance can foster confidence and self-esteem of children by praising the efforts they have done without seeing the results.

There are two approaches to discussing parental care for their children: (1) typology approach, namely demandingness and responsiveness; and (2) social interaction approach, namely the relationship between parents and children as part of a whole (Lestari, 2013: 16).

3. Ethnopedagogy Theory.

Although the personality of a person (child) can be formed through education, but the process of care and education in children should not be placed in a socio-cultural vacuum. In the context of ethnopedagogy, the pattern of care and education strategies developed by Minang migrants in the city of Surabaya should pay attention to aspects of the local wisdom of the Minang culture. Sarbaini (2015: 3), citing Alwasilah et al. (2009), states that in principle ethnopedagogy pays special attention to local genius and local wisdom by expressing local cultural values.

For the people of Minang, the cultural philosophy “*dimana bumi dipijak, di situ langaik dijunjuang*” greatly influences the patterns of care and education strategies that must be applied. Other local wisdom values, such as stories, legends, traditional tales can also color the formation of character and personality of children (Eliza (2017: 162). Zuriyah (2014: 176) explained that to realize ethnopedagogical education must explore and re-reveal the values of local wisdom as a source of innovation in the field of education and empowerment through adaptation of local knowledge, including reinterpreting local wisdom values, and revitalizing them contemporary conditions.

Alwasilah (2008 and 2009) considers that knowledge or local wisdom (local knowledge, local wisdom) in ethnopedagogy as a source of innovation and skills that can be empowered for the welfare of society. Local wisdom is a collection of facts, concepts, beliefs, and public perceptions about the world around. This includes how to observe and measure the environment, solve problems, and validate information.

III. Research Methods

This research is qualitative, with an ethnographic approach. The consideration, all the data needed requires translation and qualitative explanation, using deductive thinking during the research process (Creswell, 2015: 59). Data collection is done by observation and depth interviews. The research location is in the city of Surabaya. Implementation in the field for three months starting August to October 2018. Data analysis techniques refer to the opinion of Wolcott (1994: 36) and Miles and Huberman (1992).

IV. Results and Discussion of The Implementation of Minang Culture Philosophy

1. Strategy and Pattern of Parenting and Education for Children.

In the Minang community, the cultural philosophy “*dima bumi dipijak, di situ langaik dijunjuang*”, has a significant influence on the patterns of care and the education strategies of their children. The field research by Eliza (2017: 162) mentions that stories, legends, traditional tales are important for the formation of children's character or personality.

Minangkabau culture regulates child care including educating, guiding and the like is the responsibility of *mamak*. But in the lives of Minang migrants in the city of Surabaya, the role and function of *mamak* is partly taken over by the parents, in the sense that it is not solely by the father but the mother also takes part, including the children themselves. This is the smart strategy of the Minang diaspora in Surabaya in accordance with Law No. 3 of 2002, specifically article 26 paragraph 1, concerning Child Protection.

a) The function and role of the *mamak* are not ignored.

The roles and functions of informants as parents (father and mother) are important to fill in the roles and functions of *mamak* that are not optimal because they are geographically domiciled in other places. This was acknowledged by all informants. That is, parents (fathers and mothers) who are currently on overseas are obliged to care for and educate their children. However, specifically for matters relating to inheritance of inheritance and determining potential partners for their children, parents must consult with *mamak* and must follow his suggestions and advice.

The role and function of *mamak* must be involved optimally for women. The role and function of *mamak* towards male *kamanakan* is more consultative and guidance in order to be able to preserve the heritage and later to be able to inherit the function of *mamak* as a leader in his family (Marzali, 2000; Naim, 1994; and Kato, 2005).

Despite the role and function of overseas parents, parents still need to consult with *mamak* in the village to pay attention and consider their advice and suggestions. All of this is an implementation of Minang cultural values. “*Nan tuo dihormati, nan ketek disayangi, somo nan gadang bawo bakawan, Ibu jo bapak diutamokan*” (the older ones are respected, the small ones are loved, as well as friends, mother and father are preferred).

b) Follow *mamak* advice.

Two informants, Irham and Bakirafdi, said that when they have to determine the choice of prospective daughter-in-law. Irham's sons and Bakiraf's daughters happen to be together to get a mate, not a Minang person. This condition requires deep consideration from the *ninik mamak* and other relatives in the village. Some important aspects must be considered and discussed together with *mamak*, which is about hereditary origin, education, character, and personality of prospective daughter-in-law.

The problem of marriage will determine the quality and continuity of kinship in the next generation. In the context of the lives of Minang migrants in Surabaya, the matrilineal kinship system remains strictly enforced. However, the dimension of togetherness in kinship, or the spirit of mutual respect and mutual respect in kinship relations still gets the main space. In the Minang community, unknown family life is authoritarian, everything must be discussed together so that a consensus is reached: “*bulek aie dek pambuluah, bulek kato dek mufakaik*” (round water because of vessels, round word for consensus)

For matters of inheritance, it is not enough to consult and ask for guidance from the *mamak* only through telephone contact but must meet directly with the *mamak*. That is to avoid and anticipate misunderstandings, and as an implementation of courtesy ethics respect and respect *mamak*. Every time the Minang nomads in the city of Surabaya return to their villages, it is always used to establish a relationship between themselves and their children with *mamak*.

This indicates that the kinship relations in the Minang community have never broken up, remain well-maintained, even though they have a very strong cultural tradition of migrating. Customs or traditions of maintaining this kinship relationship

are clearly found in the saying: "*adat nan tak lakang dek paneh, nan tak lapuak dek hujan*". (adat which is not hot, and is not weathered or fragile by rain).

Usually the way that informants do in the pattern of care and education strategies in the ethnopedagogical context of their children is to take advantage of children's free time after school or after studying at night. At times like that the Minang nomads told about what the Minang proverb *dima bumi dipijak, disitu langik dijunjuang*.

2. Contributing to the Practice of Minang Cultural Values in Social Sciences Learning (IPS) in accordance with the Ethnopedagogy Principles.

In ethnopedagogy theory, there is a connection between cultural processes and education. Therefore, it is very important to consider local genius and local wisdom (Rohman, 2017: 35; Sarbaini (2015: 3); Alwasilah et al., 2009). In the context of ethnopedagogy, the pattern of care and education strategies carried out by Minang migrants in the city of Surabaya towards their children is very concerned about aspects of Minang's local wisdom culture (local wisdom or local genius).

By instilling the values of local culture (local wisdom or local genius) in education is one way for children to continue to respect their ancestral heritage in the form of beliefs and values that are contained in it to then be applied in daily life. Furthermore, this will foster an attitude of love for culture itself, and in a wider scope, automatically fostering a sense of love for his country. Efforts to cultivate local cultural values can be done through formal and non-formal education including education carried out in the home or family (Sulistiani, 2017: 269).

Based on the results of research in the field there are nine Minang local cultural values that have been implemented by Minang migrants in Surabaya as a contribution to the learning of Social Sciences (IPS) in accordance with ethnopedagogy principles, namely:

a) Consistent with the local language.

One of the cultural characteristics of the Minang people is always using the Minang language in interacting with fellow Minang people wherever they are and meeting. Minang people really don't like Minang people who use other languages, for example Indonesian, when communicating verbally with fellow Minang people. That person must have been ridiculed (ridiculed) with a very loud and painful allusion that is in the form of a sentence: "*babahaso Minang sajo, kabau!*". That is, talking about using the Minang language, *buffalo!* This satire shows that the person is considered arrogant, does not want to claim to be a Minang person, so it is no longer appropriate to be called a Minangkabau, except *kabau* or buffalo.

The consistency of Minang migrants using the Minang language, has proven that they have practiced ethnopedagogical principles in their families effectively. In the ethnopedagogy context: understanding, mastering, and understanding Minang language as wisdom of local culture is a factor that plays a very important role in the formation of children's character in the family, and on a larger scale the character of the nation (see Fajarini, 2014: 124).

b) Tolerant, not exclusive, and not selfish.

The Minang cultural philosophy that reflects tolerant, not exclusive, and unselfish attitudes and behaviors is contained in the saying "*dima bumi dipijak, disitu langik dijunjuang*". The substantive philosophical meaning is to teach that every Minang person wherever he is must be smart and able to adapt or adapt to the customs of the local community.

In other words, every Minang person must be able to show tolerant attitudes, not exclusive, and not selfish. In anthropological terminology, this attitude and behavior is referred to as cultural relativism or avoiding ethnocentrism.

According to the informant's confession, Bakirafdi, who was also justified by Irham and other informants, this cultural philosophy has been considered the most important value in the life of the Minang community. Therefore, as a migrant they and their families are obliged to apply these cultural philosophical values. Not only that, they also felt obliged to teach, instill, and transfer these noble cultural values to their children and grandchildren so as not to lose their identity as Minang people.

c) Empathy

Learning the ethics of manners by Minang migrants in the city of Surabaya to their children about empathy must understand this proverb: "*Nan elok dek awak katuju dek urang; Lamak dek awak lamak dek urang; Sakik dek awak sakik dek urang*" (What is beautiful to me, so beautiful to people; Delicious to me, so good to people; Pain to me, and pain to people). By teaching these cultural values, the goal is that their children be more careful in their relationships, both in terms of speech, behavior, and actions, not to offend others.

d) Independent

According to the Minang culture, every boy who has a teenager must start learning to live independently. That's why they have to migrate, get out of the village. The philosophy of the Minang culture that teaches being able to live independently is the proverb "*Karantau madang di hulu, Babuah babungo balun; Marantau Bujang dahulu, Di rumah baguno balun*". Meaning: "to go back and forth in the upstream, bear fruit with flowering yet, wander the bachelor first, at home is useful yet".

In the development of a highly competitive society, independence into social capital is very important for everyone to survive. Hanging life to others, not a smart solution can even be said to be unproductive. Sooner or later, it will be eroded by increasingly sharp competition.

e) Never give up.

Two proverbs that are the grip of the life of Minang migrants in Surabaya, namely 1) *Baraja ka nan manang, mancontoh ka nan sudah*; and 2) *Takuruang nak dilua, taimpik nak diateh*. The meaning of these two proverbs means never giving up. Since childhood, Minang people have been lined up and educated to be strong people, enduring all obstacles in life.

The first proverb teaches, when wandering experiences obstacles or failures, they must learn from people who have succeeded in how to achieve success. It is also important to follow the example of people who have experienced the same failure. They must learn why people also fail and learn how to overcome those failures. The second proverb, means that despite having problems, Minang people must try to overcome them then rise again. With an unyielding spirit, Minang nomads can survive wherever they are.

f) Functions and roles according to ability.

Minang people must understand the functions and roles according to their abilities and duties. Mustansyir and Munir (2009: 170) who cite from (Navis, 1986: 59), state that the Minangkabau community is also known as a group of people who imitate the harmony of the natural legal system. That is, they can be likened to all-natural elements with different levels and roles. These elements are interconnected, but not mutually binding, collide with each other, but do not eliminate each other, and group together but, do not merge with each other.

This cultural value is revealed in the proverb which means "*Yang buta penghembus lesung, yang pekak pelepas bedil, yang lumpuh penghuni rumah, yang kuat pemikul beban, yang bodoh untuk disuruh-suruh, dan yang pintar lawan berunding* (the dimmer of the dimple, the screeching, the paraplegic of the householder, the strong bearer, the ignorant to be told, and the smart opponent to negotiate). The meaning of this proverb is Minang culture assume that everyone has functions and roles according to their abilities and duties (Munir, 2018: 99).

As migrants, parents consider their children to be provided with ethics that everyone has a function and role in accordance with their abilities and duties. This, according to the informants, is important so that their children are not easily discouraged when they see other people succeed, while they fail. Or vice versa, quickly feel satisfied and then be arrogant when they get success that their friends don't get. This ethical value is considered as a filter for these attitudes and behaviors.

g) Make a clear plan.

As migraant, the informants were very aware that what was done today was a provision to welcome the future. To anticipate this, they must be able to make good, clear and measurable planning. "*Baukue jo bajangko, hiduik baraka, mati baiman*", meaning: in work must be based on clear planning, so that life becomes blessing, and when death remains faithful (to Allah SWT). The other meaning is that every stage in the life cycle must have a goal, that is, during life, it must always be faithful, so that if it dies it brings faith. Everything must be based on a clear plan of work, thinking of what is to be achieved in the future must be truly concrete not just wishful thinking, but must be achieved logically.

h) Respect for the older.

The ethics that must be instilled in Minang migrant children is respecting and respecting older people: "*nan tuo dihormati, nan ketek disayangi, samo gadang bawo bakawan, ibu jo bapak diutamokan*", meaning: the old are respected, the little ones are loved, the same great for friends, mother and father preferred).

All informants consider this ethics to be very important, especially because they are migrants who live in harmony with other cultures. Minang's cultural values are very strict in regulating relationships or kinship relations based on age categorization. Although this is not explicitly reflected in the use of language as in Javanese, it is reflected in the designations used.

In accordance with rules that apply culturally, a *kamanakan* must respect and obey his uncle, compared to his biological father. own. In the Minang culture, the child is in the lap, the *kamanakan* is buried. That is, a *mamak* must be responsible for the life of *kamanakan*, therefore the *kamanakan* must obey, obey, and respect the *mamak* rather than his parents (his father) himself.

At the core of all that, the attitude and behavior of a younger child must respect older people. This ethic of manners must be obeyed by all Minang people, including the children of the nomads who are now domiciled in the city of Surabaya.

i) Based on religious values.

Minang people are very obedient to their religious beliefs (Islam). All attitudes and behavior must be guided by customs and customs must be based on *syarak*, and *syarak* must be guided by the Book of Allah ("*Adat basandi syarak, syarak basandi kitabullah*").

The process of obedience of Minang people to Islamic rules has begun since the children were still young. They have to go to *surau* to recite (study Islam). Boys must stay in the sea until they reach adulthood as a matrilineal kinship system. That is why, every action and behavior of Minang people everywhere is still guided by the values of Islamic rules.

Minang migrants firmly admit that they have never neglected their obligations as Muslims. Irham, one of the informants explained that when he arrived at the agency Minang people were always looking for a mosque as a temporary stopover place, until they got a better shelter. This proves that the Minang people are always close to the mosque as a place to carry out their religious services (Islam).

V. Conclusion

1. Strategy for the pattern of care and education for children is carried out by Minang migrants in the city of Surabaya. Because of locality and geographical constraints. Nevertheless, the cultural values in the matrilineal kinship system that provide the role, function, and responsibility of the *mamak* to the *kamanakan* are still considered, not completely eliminated.

2. Practicing Minang Cultural Values related to the Principles of Ethnopedagogy have found at least nine cultural values that need to be considered and considered, namely:

- a. The importance of maintaining and maintaining Regional Language (Local Language) consistently. Thus, all the substantive meanings of the philosophy of Minang culture can be better understood and avoid misunderstanding.
- b. Values that teach tolerant, non-exclusive, and unselfish attitudes and behaviors that are substantively reflected in the cultural philosophy “*dima bumi dipijak, disitu langit dijunjuang*”.
- c. Value that teaches attitude and tolerant behavior as contained in the proverb “*Nan elok dek awak katuju dek urang; Lamak dek awak lamak dek urang; Sakik dek awak sakik dek urang*”.
- d. Values that teach independent attitudes and behavior. This is reflected in the saying “*Karatau madang di hulu, Babuah babungo balun; Marantau Bujang dahulu, Di rumah baguno balun*”.
- e. Values that teach unyielding attitudes and behavior. “*Baraja ka na manang, mancontoh ka nan sudah*”; dan “*Takuruang nak dilua, taimpik nak diateh*”.
- f. Values that teach attitudes and behaviors that each person has a function and role in accordance with their respective abilities. “*Yang buta penghembus lesung, yang pekak pelepas bedil, yang lumpuh penghuni rumah, yang kuat pemikul beban, yang bodoh untuk disuruh-suruh, dan yang pintar lawan berunding.*”
- g. Values that teach attitude and behavior must be able to make clear plans and measurable. “*Hidui baraka, baukue jo bajangko*”.
- h. Values that teach attitudes and behaviors respecting and respecting older people. “*Nan tuo dihormati, nan ketek disayangi, samo gadang bawo bakawan, ibu jo bapak diutamakan.*”
- i. Values that teach attitude and behavior are always based on religious values. “*Adat basandi syarak, syarak basandi kitabullah*”

V. Recommendation

Because local wisdom-based education (ethnopedagogy) is a process of enculturation of cultural values that become a foundation in a way of character that must be carried out in an ongoing process. The realization is done through education in the household environment, in the community, and in schooling (Sunaria, 2016: 53), so it is very important to recommend the nine Minangkabau cultural values included as part of the ethnopedagogic material in a way adapted to local cultural values *

Abstract: Indonesia as a sovereign state, has the ideals of creating general welfare as the primary basis for any policy makers, including legislative policy to constantly seek to improve people's lives. This is a constitutional right of every citizen, however, the desired goals rather late diterjal corruption that become mental illness menghempit Indonesian society. And these days continues to grow very rapidly, to damage the joints of the nation. Corruptions are not only detrimental to the finances or the economy of the country, but also damage the economy of the people, as well as being a threat to national and international stability. Therein required for the formulation of policies specifically in the field of law to tackle criminal crimes occurring in the present. On this condition, this study focused on two main points: how the policy formulation of the law against the rules of criminal law on corruption issues as stipulated in the legislation sdang current and pembaharuanya the legal system in force in the future.

The study on this issue using normative juridical approach, with the conceived law as the rule of the norm and the basis for human behavior, and the main source is a matter of legislation in force, because the life when viewed from the juridical, sociological and normative for the prevention of corruption in Indonesia, there are still weaknesses side. This study is required in order to reform the existing legal system in order to suppress criminal acts that could harm the state. The element of "harming the state". Implies a state's rights protected by the state in which all citizens are in it, the conception of thought is directed to harmonize rules of criminal criminalize corruptions both the Criminal Code as a primary source and rule of law that regulates the crime of corruptions , It is considered necessary for the improvement of our existing system for the life of the upcoming legal institutions.

Keywords: policy formulation, for the Prevention, corruption

I. INTRODUCTION

The establishment of an Indonesian state with a noble purpose, namely to encourage the creation of public welfare in the umbrella of the Unitary State of the Republic of Indonesia based on Pancasila. The objectives and ideals are reflected in the opening of the 1945 Constitution of the Unitary State of the Republic of Indonesia in the fourth paragraph (four) mentioned, then than that to form an Indonesian State Government that protects the entire Indonesian nation and all of Indonesia's bloodshed and to promote public welfare, educate the nation's life and participate in carrying out world order based on freedom, eternal peace and social justice, Welfare for all people is the main foundation for every policy maker, including legislative policy being its main task. The aim is to improve the standard of living of the people, which is basically a constitutional right of every Indonesian citizen. The welfare of the people of Indonesia today, is merely a dream, without being accompanied by real efforts by state administrators in carrying out the mandate of the constitution. One of the concrete actions is by formulating a good legislation, aimed at protecting the entire nation and spilling blood from all abuses including arbitrariness of people's economic rights.

Protection of all nations is an absolute thing, but followed by a good foundation and legal framework, then the applicable law is absolutely realized, not only with the words "protecting the whole nation and spilling blood" if it turns out that there is still suffering felt by the people in the form of imbalances in economic rights and reflecting the inhumanity of all the people of Indonesia. This condition of disability is created by a system of government that is not socially just for all the people of Indonesia, because it still allows for the existence of government practices in which power is exercised arbitrarily and does not take sides with the people. It is necessary to elaborate in more legal detail, so that the constitutional obligations are truly carried out properly, by creating government practices that are open, transparent and always responsible for the interests of the community at large, which is the real prosperity for the wider community based on the principles of social justice based on the Almighty Godhead. Thus protecting all of the Indonesian people and all of Indonesia's bloodshed can also mean hard and real efforts for the liberation of all the Indonesian people from real suffering. To realize these noble ideals, what is needed is a good legal system for the eradication of criminal acts of the corruption that manifests as the welfare of all Indonesian people, for a renewed legal system, a guideline for the Implementation of a Clean and Corruption Free Country, Collusion and Nepotism as desired in Law Number 28 of 1999.

In the law contains the principles or principles of legal certainty, the Order of State Administration, Public Interest, Openness, Proportionality, Professionalism, and Accountability, as described in the explanation of Article 3 as follows: (1) Principle of legal certainty, namely the principle a legal state that prioritizes the basis of legislation, propriety and fairness in every policy of the State Administration; (2) The Principle of Orderly State Administration, namely the principle that becomes the basis of order, harmony and balance in the control of State Administration; (3) Principles of Public Interest, namely principles that prioritize public welfare in an aspirational, accommodative and selective manner; (4) Principle of Openness, namely the principle that opens itself to the right of the community to obtain correct, honest and non-discriminatory information about the administration of the state while taking into account the protection of personal rights, groups and state secrets; (5) Principle of Proportionality, namely the principle that prioritizes the balance between the rights and obligations of the State Administrator; (6) Principles of Professionalism, namely principles that prioritize expertise based on a code of ethics and the provisions of applicable laws and regulations; (7) Accountability Principle, which is the principle which determines that every activity and end result of the activities of the State Administrator must be accountable to the public or the people as the highest holder of state sovereignty in accordance with the applicable legislation.

Guidelines regarding the Implementation of a Clean and Corruption-Free Country Collusion Nepotism is important and very necessary to avoid the practices of Collusion, Corruption and Nepotism not only involving officials but also their families and cronies, which if left unchecked, the Indonesian people will be in a very disadvantaged position. According to Marzuki Darusman, the spread of Corruption, Collusion and Nepotism has become so widespread that it can be said to be a corrupt radical. The practices of Corruption, Collusion and Nepotism itself are the provision of facilities or preferential treatment by government officials / State-Owned Enterprises / Regionally-Owned Enterprises to an economic unit / legal entity owned by related officials, relatives or cronies. So if these practices remain allowed, the people as the owners of state sovereignty do not get their constitutional rights, namely the right to justice and prosperity. To better guarantee the implementation of clean and free corruption, collusion and nepotism, the Law Number 31 of 1999 was established as updated by Law Number 20 Year 2001 concerning the Eradication of Corruption Crime, in lieu of Law number 3 of 1971.

The birth of this law is expected to accelerate the growth of people's welfare, with a response to the evil nature contained in corruption. Corruption is an act that can not only harm the country's finances but also can cause losses to the people's economy. Barda Nawawi Arief argues that corruption is a very despicable act, damned and highly despised by most people; not only by the people and nation of Indonesia but also by the peoples of the nations of the world. Therefore, it should be, as a nation that has the spirit to create prosperity equally and fairly able to avoid any form of corruption. Simple and unconscious forms of corruption often carried out by certain people are expected to be a common enemy that must be suppressed and eliminated from the surface of Indonesia. The forms of corruption intended by Syed Hussein Alatas as quoted by Nyoman Serikat Putra Jaya have divided them into 7 types of corruption, namely:

1. Transactive corruption (transactive corruption). Here shows the reciprocal agreement between the giver and the recipient for the benefit of both parties and actively pursues the benefits of both;
2. Extortive corruption is a type of corruption where the giver is forced to bribe to prevent losses that are threatening him, his interests, or the people and things he values;
3. Investment corruption is the behavior of victims of corruption with extortion. Corruption is in the framework of self-defense, such as the provision of goods or services without direct linkages with certain benefits, in addition to the benefits imagined to be obtained in the future;
4. Nepotistic corruption is the unauthorized appointment of friends or relatives to hold positions in government, or actions that give treatment that prioritize in the form of money or other forms, to them, in contravention of the norms and regulations apply;
5. Defensive corruption here the giver is innocent but the recipient is guilty. For example: a businessman who cruelly wants someone's property, does not sinfully give to the ruler a portion of the assets to save the rest of his assets;
6. Autogenic corruption is a form of corruption that does not involve other people and the perpetrators are only alone;
7. Supportive corruption here does not directly involve money or other forms of compensation. The actions taken are to protect and strengthen existing corruption.

These forms of corruption, especially in the form of bribery, are a very acute disease for the Indonesian people, because almost every bribery of public service institutions has become commonplace, which in the end there are difficulties in detecting corruption, and prevention is also increasingly difficult, and corruption continues to grow, spreading in every aspect of life. It should be noted and pondered what Habib-ur-Rahman Khan said that "the modern world is fully aware of this acute problem.

II. RESEARCH METHODS

The method used in this study is empirical juridical research with the nature of descriptive research that uses primary and secondary data sources with library research techniques using primary legal materials, secondary legal materials and tertiary legal materials. Primary legal material is legal material whose contents are related to government regulations or other institutions that have authority. Secondary legal sources are materials in the form of books and other printed materials, as well as software, which are the needs of this research.

III. RESULTS AND DISCUSSION

A. legislative policy for the Eradication of Corruption Crimes

The development of corruption in Indonesia is still high, while the eradication is still very slow, Romli Atmasasmita stated that corruption is also related to power because with that power the authorities can abuse their power for their personal, family and crony interests. Agreeing with Romli Atmasasmita, Nyoman Serikat Putra Jaya explained that it must be acknowledged, currently Indonesia in accordance with the results of research conducted by Transparency International and Political and Economic Risk Consultancy based in Hong Kong, always occupies a vulnerable position as far as corruption is concerned. It is recognized that corruption in Indonesia has been systemic and endemic so that it not only harms state finances, but also violates the social and economic rights of the community at large. Further said by Nyoman Serikat Putra Jaya, corruption in Indonesia has seeped into all aspects of life, to all sectors and all levels, both at the central and regional levels, the cause of which is that corruption has been allowed to take place decades ago without adequate action taken from legal eye. So it seems clear, both expert opinions directly or indirectly that corruption cannot indeed be released from power. Robert Klitgaard by basing Webster's Third New International Dictionary states that corruption is an invitation (from a political official) with undue considerations (such as bribery) to commit violations.

Evi Hartanti emphasized that, corruption is a symptom in which officials, state agencies misuse authority with bribery, forgery, and other irregularities. Here is illustrated the opportunity and closeness of corruption with a position in the government. Because corruption is very much related to power, corruption can cause a very detrimental effect on the people. Robert Klitgaard details a number of things caused by corruption including:

1. Bribery causes funds for the construction of low-cost housing to fall into the hands of the unauthorized.
2. The Commission for those responsible for the procurement of goods and services for the regional government means that the contract falls into the hands of a company that does not meet the requirements.
3. The police often because they have been bribed pretend not to know if there is a crime that should be investigated.
4. Local government employees use community facilities for personal gain.
5. To obtain permits and licenses, residents must give facilitation payments to officers and sometimes even have to give bribes so that the permit or license can be issued.
6. By giving bribes, citizens can do whatever they want to violate the rules of work safety, health regulations, or other regulations that pose a danger to the rest of the community.
7. Local government services are provided only if residents have paid an additional amount of money outside the official fee.
8. Decisions regarding land use in cities are often influenced by corruption.
9. Tax officers extort citizens, or more conspire with taxpayers, provide tax breaks to taxpayers in exchange for bribes.

This condition seems to be very in line with the spirit of lawmaking, namely through legislative policy by stipulating law number 31 of 1999 as amended by law number 20 of 2001 concerning the Eradication of Criminal Acts of Corruption in which materiel. This is as formulated in a general explanation which confirms that in order to reach various modus operandi of state finance deviations or increasingly sophisticated and complex state economies, the criminal acts regulated in this law are formulated in such a way that includes actions that enrich themselves or other people or a corporation "against the law" in formal and material terms. With this formulation, understanding against the law in criminal acts of corruption can also include despicable acts which, according to the feeling of justice, must be prosecuted. In addition to basing on unlawful nature, law Number 31 of 1999 as amended by Law Number 20 of 2001 concerning Corruption Crime also formulates acts of corruption as Formil offenses, namely offenses whose formulation is emphasized on prohibited acts. The formulation of the formal offense can be seen in the word "can" before the phrase harms state finances or the economy of the country, this shows that the existence of a criminal act of corruption is sufficient to fulfill the elements of action which are formulated not with the emergence of consequences. So corruption does not always wait for an effect, but as long as there is a potential for the state to be harmed by actions that are against the law, it can be said that there is a criminal act of corruption.

The affirmation of the formal offense is also reflected in Article 4, which affirms the return of state financial losses or the state's economy does not eliminate the criminal perpetrators of criminal acts as referred to in Article 2 and Article 3. However, the awareness of the importance of violating the material law must fail through the Constitutional Court ruling Number 003 / PUU / 2006, which states that the unlawful nature of the material contradicts Article 28D paragraph (1) of the 1945 Constitution of the Republic of Indonesia, so that the material against the material law is considered not to have binding legal force. In addition to the issue of the Constitutional Court's ruling, the formulation of criminal acts of corruption is still partial and spread in several laws, while the imposition of sanctions such as the death penalty is only aimed at certain circumstances. With the aforementioned problems, it is necessary to consider the formulation of criminal law policies in the context of overcoming corruption.

B. The Need for Penal Policy to Prevent Corruption Crime

As a crime that endangers social life, corruption is always associated with the culture or social conditions of the community. According to Robert Klitgaard, the main cause of corruption is the giving of gifts which are already customs. Along with this opinion, Umi Kulsum argues that the crime of corruption in Indonesia is an act that has taken root in various aspects of human life, so that it seems as if it is considered a culture. The term prize which later developed into bribery (as if it were cultured) is a very dangerous thing for further corruption development, so then there is an adage "if a person is suspected of corruption and then examined by law enforcement, the law enforcer has started corruption when the examination is carried out, because on the inspection there was a bribe against the examiner.

This is suspected as a culture that grows due to the mental state officials who are not good. The condition is certainly not without reason, because according to Koentjoroningrat, one of the mental characteristics of Indonesian people is the attitude to achieve goals as soon as possible, without much willingness to try step by one step It is this mental attitude which then encourages state administrators or precisely law enforcement to carry out non-commendable actions, namely bribery. This definition shows that corruption as an evil behavior is not a culture, it can even be said that corruption is essentially an anti-cultural act (anti good habits that should be behavior that can be inherited from generation to generation). As a crime, in essence corruption is produced from a learning process, according to Sutherland, through his famous theory, namely the theory of differential association which confirms that a crime (including corruption or in the language White collar Crime) is a crime obtained by studying, with propositions:

- a. Crime behavior is negatively learned behavior which means that this behavior is not inherited).
- b. Crime behavior is learned in interaction with others in a communication process. communication can mainly be verbal or use sign language).
- c. The most important part of the process of studying this crime behavior occurs in intimate personal groups. Negatively, this means that communication is not personal, relatively does not have an important role in terms of the occurrence of crime).
- d. If crime behavior is learned, what is learned includes (a) the technique of committing a crime, (b) certain motives, impulses, justification reasons including attitudes).
- e. The motives and encouragement are learned through the definitions of legal regulations. In a society, sometimes someone is surrounded by people who simultaneously see what is regulated in a legal regulation as something that needs to be considered and obeyed, but sometimes he is surrounded by people who see the rule of law as something that gives an opportunity to commit crime).
- f. a person becomes a delinquent because of access to thought patterns that see the rule of law more as an opportunity for crime to be committed than those who see the law as something that must be considered and obeyed).
- g. Differential Association varies in terms of frequency, time period, priority, and incensity).
- h. the process of studying the behavior of crimes obtained through relations with patterns of crime and anti-crime involving all the mechanisms that normally occur in each learning process in general).
- i. Meanwhile crime behavior is a statement of general needs and values, but this is not explained by the general needs and values, because non-crime behavior is also a statement of the same needs and values)

Further developments, corruption is not only a crime that can be committed by the White collar Crime but also by professionals, which according to Muladi, includes accountants, engineers, legal counsel, doctors and so on and this criminal category always involves his expertise in action, both in form of intentional, negligence, dolus eventualis (a kind of recklessness), or in the form of disciplinary violations. Furthermore, according to him, this crime is very interesting because several dimensions of thought are as follows: (1) perpetrators of crime are members of legitimate professional organizations. (2) by other members of the organization, their actions are considered beyond the pale and unacceptable forms of behavior. (3) however, their actions are often carried out conspiring with other professions. (4) perpetrators always consider themselves (self concepts) not criminals, because they carry out services to legitimate and commendable public interests. (5) crimes committed are usually difficult to detect or if prosecution can be detected it requires proof that is not easy in addition to its nature as an ambulance case. (6) often members of other professional organizations in certain cases are ambivalent.

To ward off corruption crimes as a crime that is dangerous for social life, a culture change is needed, however, cultural change is a very big change and not an easy job, even according to Satjipto Rahardjo these changes require careful study and research. These changes can also be made through a restructuring of the criminal law system which regulates corruption, which is expected to be able to influence the attitude of the Indonesian people without exception.

Changes in culture through structuring the law by Soerjono Soekanto are referred to as social engineering or social planing, namely ways to influence the community with a regular and planned system. Social engineering is closely related to the function of law, according to D. Schaffmeister that the law has a creation function if the legal norms deviate from social norms and thus humans will behave differently than before. To create social change through structuring the legal system, good social engineering is needed, where the law to be used must truly reflect protection against the public interest. As an illustration, this is why efforts are needed through reasoning policy. According to Marc Ancel, reasoning policy is a science that has a practical purpose to enable positive legal regulations to be better formulated and to provide guidance not only to legislators, but also to courts that apply laws and also to administrators or implementers of decisions. court.

This definition is very identical with the meaning of "straf rechts politiek" defined by A. Mulder as a policy line to determine: a). how far the applicable criminal provisions need to be changed or renewed; b). what can be done to prevent criminal acts. In line with the opinion of A. Mulder, Sudarto formulated the politics of law as an attempt to realize the rules that are good in accordance with the situation and situation at a time. Barda Nawawi Arief also emphasized that, studying criminal law policies basically studies the problem of how best criminal law should be created, structured and used to regulate / control human behavior, especially to combat crime in order to protect and prosper society.

In connection with changes or legal reforms aimed at the welfare of the community, it is inseparable from efforts to criminalize, namely the process of determining a person's actions as an act that can be punished. This process ends with the formation of a law in which the act is threatened with a sanction in the form of criminal. According to Sudarto, the criminalization must have criteria:

- a. the use of criminal law must pay attention to the objectives of national development, namely to create a just and materially and spiritually prosperous just society based on Pancasila; In connection with this, (the use of) criminal law aims to combat crime and impose a counter-action on the remedy itself, for the welfare and protection of the community
- b. actions that are attempted to be prevented or dealt with with criminal law must be "undesirable actions", namely actions that bring harm (material and or spiritual) to citizens;
- c. the use of criminal law must also take into account the principle of "costs and results";
- d. the use of criminal law must also pay attention to the capacity and capability of the work force of law enforcement agencies, namely that there should be no oversight of duties.

In line with what Sudarto said, according to Bassiouni, the decision to criminalize and decriminalize must be based on certain policy factors that consider various factors, including: 1) the balance of the facilities used in relation to the results to be achieved; 2) cost analysis of the results obtained in conjunction with the objectives sought; 3) assessment or assessment of the objectives sought in relation to other priorities in allocating human resources; 4) the social influence of criminalization and decriminalization related to (in terms of) secondary effects.

Thus, the ultimate goal of legal renewal is to tackle crime and public welfare, for which the placement of public interests or community interests must be a top priority, with reasoning policy there will be "legal smoothing" which according to Scholten legal refinement aims to use provisions that are public more precisely and fairly. Moreover, the issue of corruption greatly affects the economic interests of the community, so justice is something that must be realized in the interests of the public or the public. In line with this, Baharudin Lopa states that preventing collusion and corruption is not so difficult, if we consciously place public interest above personal and group interests.

Good legal arrangement through reasoning policy or legal politics by taking into account the criteria for criminalizing as described above, it is hoped that social inequality will no longer occur. According to Indriyanto Seno Adji, that the quality and typology of crime is increasing in a country due to economic development and development Of course this increase in development is also a development that is not well planned so as to cause social inequality. These social inequalities then give birth to social injustices felt by society in general and ultimately give birth to crime. In order for social order to run in accordance with the foundation of social justice, it is necessary to have changes to the formulation of criminal acts concerning corruption as stipulated in Law No. 31 of 1999 jo. Law 20 of 2001 insofar as it meets the needs of the community and aims to create public welfare or public welfare. In essence, public welfare will be easily achieved if corrupt behaviors can be prevented through better legal arrangements.

C. Policy on Criminal Law Formulation in the current Corruption Crime Response

1. Formulation of criminal acts of corruption and its scope based on the Indonesian Corruption Eradication Act

The policy on the formulation of criminal law for efforts to tackle the current criminal acts of corruption has actually experienced various changes in which the changes were made in view of the rapid development of corruption. In fact, according to some criminal or criminology experts or lawyers as previously explained, corruption is described as a disease which in its development not only damages or harms the country's finances and economy, but has exceeded those limits which are detrimental to the people's economy.

The development of corruption, especially in the scope of abuse of power and bribery, has mastered every aspect of people's lives, which in the end each society is faced with difficulties when dealing with state officials who should be able to serve every need of the community without having to pay to these officials. Such conditions then lead to legal policies regarding the corruption of developments in the direction of criminalization and decriminalization. Changes in criminal law policy for the prevention of criminal acts of corruption, thus developing rapidly in accordance with the needs of the community aimed at improving social welfare, are illustrated in the consideration of several laws regarding the eradication of criminal acts of corruption, for example as follows:

1. Consideration of Law Number 3 of 1971: a) that acts of corruption are very detrimental to the financial / economic state and hamper national development; b) that Law No. 24 Prp. In 1960 concerning Investigation, Prosecution and Corruption Criminal Investigations related to the development of the community was insufficient to be able to achieve the expected results, and therefore the law needed to be replaced.
2. Consideration of Law Number 31 of 1999: a) that criminal acts of corruption are very detrimental to the State's or the country's economy and hamper national development, so that it must be eradicated in order to realize a just and prosperous society based on Pancasila and the 1945 Constitution; b) that the consequences of criminal acts of corruption that have occurred so far in addition to harming the state's finances or the country's economy, also hamper the growth and sustainability of national development that demands high efficiency; c) that Law Number 3 of 1971 concerning the Eradication of Corruption has no longer been in line with the development of legal needs in the community, because it needs to be replaced with the new Law on the Eradication of Corruption, so that it is expected to be more effective in preventing and eradicating criminal acts corruption.
3. Consider Law No. 20 of 2001: a) that corruption that has been widespread has not only been detrimental to state finances, but has also been a violation of the social and economic rights of the community at large, resulting in corruption it needs to be classified as a crime whose eradication must be done extraordinarily; b) that in order to better guarantee legal certainty, avoid the diversity of legal interpretations and provide protection for the social and economic rights of the community, as well as fair treatment in combating corruption, it is necessary to amend Law Number 31 of 1999 concerning Eradication of Criminal Acts Corruption; c) that based on the considerations as referred to in letter a and letter b, it is necessary to establish a Law concerning Amendments to Law Number 31 of 1999 concerning Eradication of Corruption Crimes. The consideration of the need for the formulation of criminal acts of corruption, as expressed in the considerations in the above legislation, shows the existence of concerns over criminal acts of corruption that have harmed state finances and hampered national development. then changes in the formulated corruption can be seen from the formulation of criminal acts of corruption in Article 1 paragraph (1)
4. Law Number 3 of 1971 as follows: a) the person who is against the law commits an act of enriching himself or another person, or an Agency, which directly or indirectly harms the state's finance and or the country's economy, or is known or it should be suspected by him that the act is detrimental to the state's finances or the country's economy; b) whoever has the purpose of benefiting himself or another person or an Agency, who misuses the authority, opportunity or means thereof because of his position or position, which can directly or indirectly be detrimental to the country's finances or the country's economy.

The formulation of corruption in Law No. 3 of 1971 laid corruption as material offenses. The consequence of this formulation is that corruption must be proven in advance whether it has harmed the country's finances or not. The formulation with this model resulted in the ineffectiveness of the handling of criminal acts of corruption, especially those carried out by state officials. The ineffectiveness of eradicating corruption was based on the formulation of material offenses, then gave birth to a new corruption eradication policy by formulating corruption as a formal offense. The principle of forming a law for the eradication of criminal acts of corruption also seems to be encouraged by the movement of criminal acts of corruption which not only harm the country's finances or economy but have damaged social rights and economic rights of the people. this condition then changed the criminal law policy, in which the criminal acts of corruption which were originally formulated based on material offenses were changed to formal offenses. This can be seen in Article 2 and Article 3 of Law Number 31 of 1999 jo. Law Number 20 of 2001 concerning the Eradication of Corruption Crime acts as follows: Article 2 paragraph (1): Every person who violently violates an act enriches himself or another person or a corporation that can harm the state's finance or the country's economy. Article 3 Any person who aims to benefit himself or another person or a corporation, misuses the authority, opportunity or means available to him because of a position or position that can harm the state's finance or the country's economy.

Both formulations place corruption as formal offenses, where acts of corruption remain punished even if there is no loss to the country's finances or economy. This is in accordance with the explanation of Article 2 paragraph (1) of Law No. 31 of 1999 that the word "can" before the phrase "detrimental to the financial and / or economic state shows that criminal acts of corruption are formal offenses, namely the existence of criminal acts of corruption sufficiently fulfilled the elements of action which have been formulated not with the emergence of consequences. Corruption acts as formulated in Law Number 31 Year 1999 jo, Law Number 20 Year 2001, there are several scope of corruption, and according to Hendarman Supandji the scope is divided into 5 (five) groups, namely: 1). offense relating to losses of state finances. 2). Delegation groups related to bribery and gratuity. 3) Delegation groups related to embezzlement in office, 4). Delegation groups associated with extortion in office, 5). Delegation groups related to chartering, suppliers and partners . In detail, these groups can be seen in Law Number 31 of 1999 in conjunction with Law Number 20 of 2001 of 2001 concerning Eradication of Corruption Crime, as follows:

1. Groups of offenses in the event of loss of State finances, This group is as confirmed in Articles 2 and 3 (as described above).
2. Delegation groups related to bribery and gratuity.

Included in this group are as outlined in: Article 5 paragraph (1) letter a) give or promising something to civil servants or state administrators with the intention that the civil servants or organizers of the state do or do not do something in their positions, contrary to their obligations, b) give something to public servants or state administrators because or relating to something that is contrary to obligations, carried out or not done in his position.

Based on Article 5 (paragraph 2) For civil servants or state administrators who receive gifts or promises as referred to in paragraph (1) letter a or letter b, Article 6 paragraph (1); a), giving or promising something to the judge with the intention of influencing the case decision handed over to him to be tried; or b). give or promise something to someone who, according to the provisions of legislation, is determined to be an advocate to attend a court hearing with the intention of influencing the advice or opinion to be given in connection with a case submitted to the court for trial. Article 6 paragraph (2) For the judge who receives the gift or promise as referred to in paragraph (1) letter a or the lawyer who receives the gift or promise as referred to in paragraph (1) letter b, shall be punished with the same criminal offense as referred to in paragraph (1)

Article 11 A state employee or state official who receives a gift or promise even though it is known or reasonably suspected, that the gift or promise is given because of the power or authority related to his position, or in the mind of the person giving the gift or promise is related to his position. Article 12 civil servants or state administrators who receive gifts or promises, even though it is known or reasonably suspected that these gifts or promises are given to mobilize to do or not do something in their position, which is contrary to their obligations; a) a civil servant or state administrator who receives a prize even though it is known or reasonably suspected that the gift is given as a result or caused by having done or did not do something in his position that is contrary to his obligations; b) a judge who receives a gift or promise, even though it is known or reasonably suspected that the gift or promise is given to influence the case decision handed over to him for trial; c) someone who according to the provisions of the legislation is determined to be an advocate to attend a court hearing, receive a gift or promise, even though it is known or reasonably suspected that the gift or promise to influence the advice or opinion to be given, in connection with the case submitted to the court for trial.

Article 12 B Every gratuity to a civil servant or state organizer is considered as giving a bribe, if it relates to his position and which is contrary to his obligations or duties. Article 13 Every person who gives gifts or promises to civil servants bearing in mind the power or authority attached to his position or position, or the giver of the gift or promise is deemed to be attached to the position or position.

3. The offense group associated with embezzlement in office

The offense in the scope of embezzlement in office is formulated in the following articles: Article 8 civil servants or persons other than civil servants who are assigned to run a public office continuously or for a while, deliberately embezzling money or securities held for their position, or allowing money or securities are taken or darkened by other people, or help in carrying out these actions. Article 9 Civil servants or persons other than civil servants who are given the task of running a public office continuously or for a while, deliberately falsifying books or lists specifically for administrative examinations. Article 10, civil servants or persons other than civil servants who are given the task of running a public office continuously or for a while, intentionally: a) embezzling, destroying, damaging or making usable goods, deeds, letters, or lists that are used to convince or prove before an authorized official, who is controlled because of his position; or b) allowing other people to eliminate, destroy, damage or make use of these items, deeds, letters or lists; or, c) help other people eliminate, destroy, damage or make use of these items, deeds, letters or lists.

4. Delict groups related to acts of extortion in office

Extortion in the position as referred to in the law on corruption, is formulated in the following article: Article 12, a) Civil servants or state administrators with the intention of benefiting themselves or others against the law, or by abusing their power forcing someone to give something, pay, or accept payment by piece, or to do something for himself; b) civil servants or state administrators who at the time carry out their duties, request, receive, or deduct payments to other civil servants or state administrators or to the general cash, as if the public servants or other state administrators or the general cash have debts to them, even though it is known that this is not a debt; c) civil servants or state administrators who, when carrying out their duties, ask for or accept jobs, or hand over goods, as if they were a debt to themselves, even though it is known that this is not a debt;

5. Delict groups related to chartering, suppliers and partners

Regarding criminal acts of corruption relating to chartering, suppliers and partners, formulated in Article 7 and Article 12, which confirms that: Article 7, a). contractor, a building expert who at the time of building, or a building material seller who, at the time of submitting building materials, commits fraudulent acts that could endanger the security of people or goods, or the safety of the state in a state of war; b) every person in charge of supervising the construction or surrender of building materials, intentionally allows fraudulent acts as referred to in letter a; c) any person who at the time of delivering goods for the needs of the Indonesian National Army and / or the National Police of the Republic of Indonesia commits fraudulent acts that could endanger the safety of the state in a state of war; or d) everyone who is in charge of supervising the supply of goods for the Indonesian National Army and or the National Police of the Republic of Indonesia deliberately allows fraudulent acts as referred to in letter c. Article 7 paragraph (2) For people who receive the surrender of building materials or people who receive the delivery of goods for the Indonesian Armed Forces and or the National Police of the Republic of Indonesia and allow fraudulent acts as referred to in paragraph (1) letter a or c, be punished with criminal offenses the same as referred to in paragraph (1). Article 12 civil servants or state administrators who, at the time of carrying out their duties, have used state land on which they have the right to use, as if in accordance with laws and regulations, have disadvantaged the rightful person, even though he knows that the act is contrary to the laws and regulations; or a) civil servants or state administrators, directly or indirectly, deliberately participate in chartering, procurement, or leasing, which at the time of the act, for all or part of them is assigned to manage or supervise it. In more detail, Barda Nawawi Arief details the scope of the criminal acts of corruption as follows:

1. Law Number 3 of 1971: Article 1: (1) a), Whoever: is against the law; enrich yourself, others, or a body; which directly or indirectly harms the country's finances and or economy; or it is known or deserved to be suspected by him that the act is detrimental to the country's finances or economy. b) Whoever: for the purpose of benefiting themselves, others, or a body; misusing the authority, opportunity, or means available to him because of a position or position that directly or indirectly can be detrimental to the country's finances and or economy. c) Whoever: commits a crime in Article 209, 210, Article 387, 388, Article 415 up to article 420, Article 425 and Article 435 of the Penal Code; d) Whoever: gives a gift / promise; to Civil Servants in Article 2; keeping in mind the power or authority attached to his position or position, or the giver is deemed inherent in his position or position. e) Whoever: without reasonable reason; in the shortest possible time after receiving a gift or appointment; given to him as mentioned in Article 418, 419, and Article 420 of the Criminal Code; not report the gift or promise to the authorities. f) Anyone who conducts an experiment or agreement to commit a crime is in paragraph (1) a, b, c, d, e, f of this article.
2. Law Number 31 of 1999: Corruption Crime (Chapter II, Article 2 to Article 20); 1) Article 2 (derived from Article 1 sub-article 1a of Law Number 3 of 1971): Everyone: who is against law, committing acts enriching oneself, others or corporations, which can harm the country's finances or economy. 2) Article 3 (originating from Article 1 sub 1b of Law Number 3 of 1971): Everyone: for the purpose of benefiting himself, another person, or a corporation, misusing the authority, opportunity or means available to him because of his position or position, can harm the country's finances or economy. 3) Article 4 (new article): the return of financial or economic losses to the state does not eliminate the punishment of Article 2 and Article 3. 4) Article 5 (originating from Article 1 sub 1c of Law Number 3 of 1971 jo. Article 209 of the Criminal Code). 5) Article 6 (originating from Article 1 sub 1c of Law Number 3 of 1971 jo. Article 210 of the Criminal Code). 6) Article 7 (derived from Article 1 sub-section 1c of Law Number 3 of 1971 jo. Article 387 and Article 388 Criminal Code 7) Article 8 (derived from Article 1 sub 1c of Law Number 3 of 1971 jo. Article 415 of the Penal Code). 8) Article 9 (originating from Article 1 sub-section 1c of the Act Number 3 1971 jo. Article 416 of the Criminal Code). 9) Article 10 (originating from Article 1 sub 1c of Law Number 3 of 1971 jo. Article 417 of the Criminal Code). 10) Article 11 (derived from Article 1 sub 1c of Law Number 3 of 1971 jo. Article 418 of the Criminal Code). 11) Article 12 (derived from Article 1 sub-section 1c of Law Number 3 of 1971 jo. Article 419, Article 420, Article 423, Article, 425 and Article 435 of the Penal Code). 12) Article 13 (originating from Article 1 sub-section 1 of Law Number 3 of 1971): 13) Article 14 (new article): violation of the provisions of a law expressly declared as Corruption Crime, the provisions of this law apply (Act -Anct Number 31 of 1999). 14) Article 15 expansion of Article 1 sub 2 of Law Number 3 of 1971, namely not only "trial" and "bad agreement" but also "assistance is punished with the perpetrators of Corruption Crime. 15) Article 16 (new article): every person outside the territory of the Republic of Indonesia; who gives assistance, opportunities, facilities, or information for the occurrence of a Criminal Act
3. Law Number 20 Year 2001, Changing the formulation of Corruption Crimes in Article 5 up to Article 12 of Law Number 31 Year 1999 by not referring to the articles of the Criminal Code, but directly mentioning the elements of the offense concerned, Inserting / adding articles -new article into Law No. 31 of 1999: 1) Article 12 A (1) Criminal provisions in Article 5 to Article 12 do not apply to Corruption Crimes which are worth less than Rp 5,000,000.00 (five million rupiahs)) (2) Corruption Crime, which is worth less than Rp. 5,000,000.00 (five million rupiahs), shall be sentenced to a maximum of 3 (three) years of imprisonment and a fine of a maximum of Rp. 50,000,000 (fifty million rupiahs). 2) Article 12 B (gratuities) : (1) Gratification to a Civil Servant / State Operator is considered giving a bribe, if: related to his position, and contrary to his obligations / duties with the following provisions: a. the value is Rp. 10,000,000.00 (ten million rupiahs) or more where proof (as not a bribe) is with the recipient (defendant); b. the value is less than 10,000,000.00 (ten million rupiahs), then proof (as a bribe) in the public prosecutor.

The scope of corruption is quite extensive, as stipulated in Number 31 of 1999 jo. Law Number 20 of 2001, in its essence is quite good. However, the Law still has juridical problems in the formulation of criminal acts of corruption, where the problems make it difficult for the operation of the Criminal Code as the parent system in bridging the eradication of criminal acts of corruption. These problems include: 1). Law Number 31 Year 1999 jo Law Number 20 Year 2001 concerning Corruption Crime has not yet been formulated juridical boundaries or juridical understanding regarding criminal acts of corruption concerning conspiracy, while the evil consensus contained in the Criminal Code Article 88 is a term regulated in Chapter IX is impossible to operationalize considering Article 103 of the Criminal Code requires that the provisions in Chapters I to Chapter VIII apply to acts which are subject to criminal provisions under other laws. Likewise regarding the term "assistance" which is a juridical term, it has not been regulated in this law. 2). Law Number 31 Year 1999 jo Law Number 20 Year 2001 concerning Corruption Crime does not include offense qualifications whether as "violations" or "crimes" so that the Criminal Code cannot be operationalized against corruption in particular regarding trial offenses, because in the Criminal Code only trials against crimes that can be punished.

In addition to these juridical issues, according to Barda Nawawi Arief, in the Law the eradication of acts of corruption makes the crime of money laundering a crime of corruption. This assertion was conveyed at the National Seminar "to welcome the renewal and establishment of a law to eradicate corruption, collusion and nepotism", in cooperation with the Faculty of Law, General Sudirman University and Bappenas, in Baturaden, Purwokerto, January 30, 1999, when discussing plans to amend the Number Law. 3/1971 (which later became Law Number. 31/1999), and at the National Seminar on "Eradicating and Mitigating Corruption with the Reversed Proof System", Seblas Maret University Law School, Quality Hotel, Surakarta, July 10, 2001, while discussing the Draft Act Amendment to Act Number. 31/1999 (which later became No. 20/2001). According to him that: In the Number Law . 3/1971 and Law No. 31/1999 there are only two groups of corruption acts, namely: the TP-K group (Corruption Crime) and the TP-BDK group (Corruption Related Corruption). So there is no third group, which I call the term "Crime After Corruption" (abbreviated as "TP-SK"). In this third group it is proposed the inclusion of money laundering.

Based on the thoughts of Barda Nawawi Arief, corruption is not only in the case of acts or initial crimes, but also acts related to corruption and further actions, namely acts after corruption is committed, or the results of acts of corruption. Regarding the money laundering crime, it has been formally formulated in Article 2 of Act Number 25 of

2003 concerning Crime of Money Laundering, with the formulation as follows: The proceeds of a crime are Wealth Assets totaling Rp 500,000,000.00 (five hundred million rupiah) or more or equivalent value, which is obtained directly or indirectly from a crime: a. corruption; b. bribery; c. smuggling of goods; d. labor smuggling; e. immigrant smuggling; f. banking; g. narcotics; h. psychotropic; i. slave, female and child trade; j. illegal arms trade; k. kidnapping; l. terrorism; m. theft; n. referee

In the formulation, it is stated that assets totaling at least Rp. 500,000,000.00 (five hundred million rupiahs) or equivalent resulting from criminal acts of corruption and bribery (letter ad. B) as acts of money laundering. Corruption is essentially a form of financial crime. As an inter-crimes crime, money laundering will almost certainly be carried out or at least money laundering must be done immediately. Between corruption and bribery with money laundering there is a series of crimes, where corruption and bribery can be said as predicate offense while money laundering is a follow-up crime. Crimes and proceeds of these crimes can be categorized as a series of corruption that should be included in corruption.

Even further, UNCAC recommends that Money Laundering be included in the legislation of corruption, as reflected in the following Article 14 and Article 23: Article 14. Measures to Prevent Money Laundering, 1. Each State Party obligatory): (a) Establish a comprehensive internal regulation and supervision regime for banks and non-bank financial institutions, including individuals and legal entities that provide official or non-official services for remittances or value and, where appropriate, other bodies that are especially vulnerable to money laundering, within their authority, to detain and detect all forms of money laundering, which regime is obliged to emphasize the requirements for the customer and, as appropriate, identification of the recipient of the rights, document storage and reporting of suspicious transactions) (b) Without ignoring Article 46 of this Convention, ensuring that bodies are authorized g in the administrative, regulatory, law enforcement, and other fields aimed at eradicating money laundering (including, where appropriate under national law, judicial bodies) have the ability to cooperate and exchange any information at the national and international levels with conditions which is determined by its national law and, for that purpose, must consider the establishment of a financial intelligence unit that functions as a national center for the collection, analysis and dissemination of information about money laundering that may occur). 2. States Parties shall consider taking appropriate measures to detect and monitor the movement of cash and securities instruments that cross their borders, are subject to safeguards to ensure reasonable use of information and without blocking any legitimate capital movements. Such actions can include the requirement that individuals and business entities report large amounts of cross-border cash transfers and appropriate securities instruments). 3. States Parties shall consider carrying out reasonable and appropriate measures to require financial institutions, including money senders): (a) To include in forms for electronic transfers of funds and messages - related messages, careful and valuable information about their origin); (b) To store such information throughout the payment sequence; and (c) To apply high accuracy to the transfer of funds that do not include complete information about their origins). Article 23. Washing of the Results of Crime regulates:

1. Each State Party must take, in accordance with the basic principles of its national law, legislative and other measures deemed necessary to establish criminal offenses, if done intentionally: (a) Conversion or transfer of wealth, knowing that (i) the wealth is the proceeds of the crime, for the purpose of hiding or disguising the origin of unauthorized wealth or helping people who are involved in carrying out the original crime to avoid the legal consequences of their actions); (ii) Concealment or disguise of the nature, source, location, release, movement or actual ownership of or rights relating to wealth, knowing that the wealth is the proceeds of crime). (b. Based on the basic concept of the legal system: (i) the acquisition, ownership or use of wealth, knowing, at the time of receipt that the wealth is the proceeds of crime); (ii) Participating in, relating to or conspiracy to commit, attempts to commit and assist, conspire, facilitate and encourage the implementation of any crimes committed in accordance with this Article).
2. For the purpose of implementing or applying paragraph (1) of this Article): (a) Each State Party shall endeavor to apply paragraph (1) of this Article in the broadest sense of original crime); (b) Each State Party shall include as origin crime at least a comprehensive series of criminal offenses established in accordance with this Convention); (c) For the purposes of sub-paragraph b above, original crimes include crimes committed both inside and outside the jurisdiction of the State Party concerned. However, crimes committed outside the jurisdiction of a State are original crimes if the act constitutes a criminal offense based on the national law of the State where the action is carried out and is a criminal offense under the national law of the State Party implementing or implementing this Article when such action carried out there); (d) Each State Party must submit a copy of its law that applies this Article and subsequent changes to the law or an explanation thereof to the Secretary General of the United Nations); (e) If required by the basic principles of the national law of a State Party, it can be determined that the crimes referred to in paragraph (1) of this Article do not apply to people who committed an original crime).

The affirmation of the UNCAC Convention in articles 14 and 23 is a sign that criminal law policy related to criminal acts of money laundering will be more effective if it is included as a criminal act of corruption which is a comprehensive series of crimes (comprehensive range of criminal offenses). These include those who participate, conspiracy, trials, assistance, advocacy (Participation in, association with or conspiracy to commit, attempts to commit and proceed, abetting, facilitating and counseling the commission of any offenses).

D. Spread the formulation of criminal acts in various laws and regulations in Indonesia.

In addition to juridical issues as outlined above, there are also problems regarding the scope of corruption that is spread in other legislation outside of Law Number 31 Year 1999 jo. Law Number 20 Year 2001 concerning Eradication of Corruption Crime, namely:

1. Law Number 11 of 1980 concerning Bribery Crime The nature of criminal acts of corruption is bribery as stipulated in Law Number 11 of 1980, in this law it was formulated that: Article 2, whoever gives or promises something to someone with the intention of persuading so that the person does something or does not do something in his duty, which is contrary to his authority or obligations concerning the public interest. Article 3 Anyone who accepts something or promises, while he knows or deserves to be able to guess that the giving of something or an appointment is intended so that he does something or does not do something in his duty, which is contrary to his authority or obligation concerning public interest. After the enactment of Law Number 31 Year 1999 jo. Law Number 20 of 2001 concerning the eradication of acts of corruption, practically the law regarding criminal acts regarding bribery is not operationalized, because every bribery is always subject to sanctions as stipulated in the law on combating corruption. Seeing the effectiveness of this law should be revoked, so as not to create the impression of bribery as stipulated in Law No. 11 of 1980, is a criminalization that does not have the meaning of a real criminal act, or with other words of criminalization of bribery in law. the law is only a political need, not a legal arrangement as an answer to the legal needs of the community.
2. Law on banking.

The formulation of criminal acts in Law Number 10 of 1998 concerning Banking is contained in Article 49 paragraph (2) which states that "Members of the Board of Commissioners, Directors, or bank employees intentionally: request or accept, permit or agree to receive a reward , commissions, additional money, services, money or valuables, for personal gain or for the benefit of his family, in order to obtain or attempt to obtain for others in obtaining advances, bank guarantees, or credit facilities from banks, or in the context of purchasing or discounting by the bank on money orders, promissory notes, checks, and trade papers or other proof of liability, or in the framework of giving approval to others to carry out withdrawals of funds that exceed their credit limit at the bank; The formulation of Article 49 paragraph (2) letter a states that members of the board of commissioners, directors, or bank employees who "request or accept, allow or agree to receive a reward, commission, additional money, service, money or valuables, for their personal benefit or for the benefit of his family ". If examined more closely, the formulation is a form of corruption in the scope of bribery, or gratification as stated in the law on corruption.

3. Law concerning taxes
The formulation of criminal acts in the taxation environment is set forth in Article 36A of Law No. 16 of 2000, affirming that "If the tax officer in calculating or stipulating tax is not in accordance with the applicable tax law so that it is detrimental to the state, the tax officer concerned may be sanctioned according with the provisions of the applicable legislation. "Explanation of Article 36A of Law Number 16 Year 2000, states that:" In order to improve services to taxpayers and improve the ability of tax officers to tax officers who calculate or determine tax that is not appropriate with the tax law to cause state losses, be subject to sanctions in accordance with the provisions of the applicable legislation "The formulation as outlined in Article 36A of Law Number 16 Year 2000, is identical to the formulation of criminal acts of corruption, in which the elements mentioned a it is "detrimental to the state", Along with the development and needs of the community, then Law Number 16 Year 2000 concerning Taxes is amended by Law Number 28 of 2007. In Article 36.A undergoes the following changes: (1) Tax officials are due to negligence or intentionally calculating or stipulating taxes not in accordance with the provisions of tax laws subject to sanctions in accordance with the provisions of legislation. (2) Tax employees who in their duties intentionally act outside of their authority stipulated in the provisions of tax laws and regulations , can be filed with an internal unit of the Ministry of Finance that has the authority to carry out inspections and investigations and if proven to do so is subject to sanctions in accordance with the provisions of legislation. (3) Tax officials who are proven to have extorted and threatened taxpayers to benefit themselves against the law dian cam with the criminal as referred to in Article 368 of the Criminal Code (4) A tax official with the intention of benefiting himself illegally by abusing his power forces someone to give something, to pay or receive payment, or to do something for himself itself, threatened with criminal as referred to in Article 12 of Act Number 31 of 1999 concerning Eradication of Corruption and its amendments.

Amendments to Article 36A of Law Number 28 of 2007 only confirm that only paragraph (4) is a criminal act of corruption, so that Article 12 of Law Number 31 Year 1999 jo. Act No. 20 of 2001, wherein the law This law constitutes a criminal act of extortion in a position regulated in Article 12 letter (e) which affirms that: "a civil servant or state administrator which is intended to benefit himself or others against the law, or by abusing his power forces someone to give something, pay, or accept payment by piece, or to do something for themselves. "It is very unfortunate that Article 36A paragraph (1) is not affirmed as a criminal act of corruption, even though the element of" negligence "or" intentional "in tax calculation can result in losses in "Financial or economic state", which is a criminal act of corruption.

Article 36A paragraph (1) of Law No. 28 of 2007 should maintain the formulation of Article 36A of Law Number 16 of 2000, where the element "detrimental to the state" becomes an essential element, this is intended to avoid multiple interpretations of the formulation so that it can avoiding contradictions regarding whether or not sanctions can be applied in accordance with Law Number 31 of 1999 in conjunction with Law Number 20 of 2001, even though the law on the eradication of criminal acts of corruption as intended can be applied for tax violations in accordance with Article 36A paragraph (1) Law Number 28 Year 2007, where Article 14 of Law Number 31 Year 1999 jo. Law No.

20 of 2001, affirms that "Everyone who violates the provisions of the Law which expressly states that violations of the provisions of the Act as acts of corruption apply the provisions stipulated in this Law".

E. Policy on Criminal Law Formulation in the Prevention of Future Corruption Crimes

The policy on formulating the Criminal Law in the context of the coming up of corruption in the future has actually been pursued, namely through the drafting of a law on the Eradication of Corruption Crime (August 2008 Manuscript). which was confirmed in the consideration stating that "the ratification of the United Nations Convention Against Corruption, 2003 (United Nations Anti-Corruption Convention 2003) with Law Number 7 of 2006, then Law Number 31 of 1999 concerning Eradication of Corruption Crimes has been amended with Law No. 20 of 2001, it is necessary to adapt it to the 2003 United Nations Anti-Corruption Convention. "The draft law on the Eradication of Criminal Acts of Corruption provides definitions or use of terms regarding certain matters in Chapter I (general provisions) as berikut: Article 1 In this Act what is meant by:

1. Corporations are organized groups of people and / or wealth, both legal entities and non-legal entities.
2. Public Officials are: a. every person who holds a legislative, judicial or executive position appointed or elected permanently or temporarily paid or not paid regardless of the seniority of that person; b. everyone who carries out public functions including for the benefit of a public agency or public company or one that provides public services based on legislation; c. every person designated as a public official in the laws and regulations.
3. Foreign Public Officials are: a. every person who holds the executive, legislative or judicial office of a foreign country either based on appointment or election, including all levels and parts of his government, b. any person who performs public functions for the benefit of a foreign country, including public agencies or foreign public companies; or c. every official or representative of an international public organization.
4. Officials of the Public International Organization are any international civil servants or any person authorized by the organization to act on behalf of the organization.
5. Wealth is any form of assets, whether corporate or nonporporal, movable or immovable, tangible or intangible, and legal documents or instruments that prove the rights or interests of these assets.
6. Foreclosure is a series of actions by investigators to take over and / or save under the control of movable or immovable objects, tangible or intangible for the purpose of investigation, prosecution and justice.
7. Deprivation is the permanent takeover of wealth with the decision of a court or other authorized body.
8. Origin Crime is any crime that results in a criminal act that is the object of another criminal offense.
9. The Result of Criminal Actions is any wealth obtained directly or indirectly from a crime.
10. Gifts or Promises are any form that provides benefits or pleasures for those who receive.

The meanings as stipulated in Chapter I (general provisions) above seem to adjust to the editorial of the 2003 UNCAC Convention as follows: Article 2 Use of Terms for the purposes of this Convention: (a) Public officials "means: (i) everyone holding a legislative, executive, administrative, or judicial office of a State Party, whether appointed or elected, either permanently or temporarily, whether paid or not paid, regardless of the person's seniority; (ii) everyone carrying out public functions, including for a public institution or public company, or providing public services, as referred to in the national laws of the State Party and as applicable in the appropriate legal field of that State Party; (iii) each person referred to as a "public official" in the national law of the State Party.

For the purposes of certain efforts listed in chapter II of this Convention, "public official" may mean any person carrying out public functions or providing public services as referred to in the national laws of the State Party and as applicable in the appropriate legal field of that State Party. (b) Foreign public officials "means everyone who holds a legislative, executive, administrative, or judicial office from a foreign country, whether appointed or elected, and every person who carries out public functions for a foreign country, including for public institutions or public company;) (c) every international civil servant or every person authorized by the organization to act on behalf of the organization;) (d) Wealth "means any form of asset, whether corporate or non-corporal, moves or does not move, is tangible or intangible, and legal documents or instruments that prove the rights or interests in these assets;) (e) proceeds of crime "means any wealth originating from or obtained, directly or indirectly, through the implementation of a crime;) (f) freezing" or " seizure "means the temporary prohibition of transfer, conversion, release or transfer of wealth, or temporary supervision or control of wealth based on an order issued by a court or other authorized body;) (g) Deprivation" which includes imposition of fines if applicable, means permanent seizure of wealth by order of the court or other authorized body;) (h) Prosecution tan origin "means any crime by which the results obtained can be the subject of a crime.)
