ABSTRACT- A well-coordinated strategy and superior operations are required to meet the industry's objectives. Both are critical, and they must exist in tandem. When they do, the financial sector will benefit from a significant premium. Without a doubt, leaders understand the importance of aligning strategy and operations, but few organisations have organised systems in place to do so. Instead, most people approach the critical link haphazardly.

Some outperform their competitors. We learn from the best, and the regulator is no exception to this rule.

In this case, the financial industry regulator requires a formal systems approach, which will be the best way to optimise strategy and operations, i.e., to execute their strategy. Many studies have concluded that numerous systems, such as the Balanced Scorecard, Total Quality Management, and Six Sigma, can be of assistance.

Granted, there are still numerous organisations that have attempted some of the aforementioned but have been unsuccessful for various reasons, and it has been demonstrated that they could not make everything work because they either lacked a plan or their performance management systems were not equipped with the necessary tools.

I. INTRODUCTION

For effective strategic planning, one must adopt a mindset of putting priorities first. Before doing anything else, you must have a thorough understanding of the capacities and pursuits of your organisation. You must fully understand how it functions, which is the second requirement. The fastest way to correct this unfortunate situation and avoid rearranging the deck chairs on the Titanic is to speed up the process of doing so.

This is especially important after such a rough ride and considering the negative connotation of South Africa's standing in the eyes of the world because South Africa is the most unequal country in every single region of the world. The purpose of the financial industry sector has been introduced with this shot, which is of utmost importance.

Levy et al. (2021) stated in their research that the Constitution of this country requires the government to ensure that these services are gradually made available to all citizens. However, you must do this while adhering to the limitations imposed by the available resources. South Africa's experience shows that a positive trajectory can be maintained as long as influential groups and the general public believe that historical inequity and injustice are being addressed. The fact that South Africa has been on a good track for a long time supports this.

Financial market analysis and social stratification analysis are frequently considered separate subfields in sociology (Keister, 2002). However, financial market distributional outcomes are central to many studies of money and banking, and an important and growing body of literature investigates these outcomes directly. Wealth research must look into the function of financial markets in the creation and maintenance of inequality.

Money is impersonal, according to Keister (2002), who quotes sociologist Simmel (1978), and money plays a role in building and prolonging alienation. Money, he maintained, is an impersonal system of commerce with power because it permits individuals to control and be things they would not otherwise be
able to control or be (1963). Marx predicted in 1964 that in 1973, money would saturate social life and establish disconnected social trade.

II. TOPICS RELATED TO BANKING, MONEY AND THE ECONOMY

According to Keister (2002), sociological research on financial markets and banking is diverse, but it is united by the idea that a financial market is a social system (Adler & Adler 1984, Baker et al., 1998, Mizruchi & Stearns 1994b). The financial services industry has a major economic impact (Kenton, 2021; Kurt, 2022; Asmundson, 2022). It encourages the free flow of capital and market liquidity, both of which are required for an economy to function. Mortgages and loans account for a sizeable portion of this industry's revenue, which rises as interest rates fall.

The financial services sector has an impact on every South African (National Treasury, 2011). It enables economic growth, job creation, the construction of critical infrastructure, and long-term development for South Africa and its people. As a result, it is critical that the sector be well-regulated and stable.

The financial sector's efficiency determines the economy's overall health. The more robust the economy, the more secure the nation. A failing financial sector usually indicates a failing economy. The financial services industry is the main engine of a country's economy (Investopedia, 2021). It keeps the market liquid and makes sure that money can flow freely. Businesses in this sector benefit from economic growth and improved risk management when the industry as a whole is healthy.

The health of a country's financial services industry influences how prosperous its people are. When the sector and economy are strong, consumers typically make more money. This boosts their purchasing power and self-esteem. When they need credit for large purchases, they look to the financial services industry for help.

In a Business Day article published on December 8, 2021, Mbokazi (2021) asserts that the financial sector is a critical component of the country's economy and a key driver of all other sectors. Meaningful financial sector transformation is required for the country to progress and achieve its objectives.

These are the views of sector leaders who recently attended a webinar led by Andile Khumalo, co-founder of Sanlam Gauge, to discuss sector transformation challenges and solutions.

Lerato Ratsoma, managing director of the rating agency Empowerdex, provided an overview of the findings and warned against complacency, encouraging industry leaders to look into ways to improve transformation that would lead to greater economic inclusion. She was also concerned about the ongoing issue of a misalignment between skill development and management control (Mbokazi, 2021).

III. OBSERVE AND TAKE NOTE

Large, well-managed organisations, according to Van van Heijden (2005), are especially vulnerable to strategic failures caused by a perception crisis during times of rapid change. As the rate of change accelerates, so does the risk. He defines this as being so engrossed in an outdated assumption that one is unable to recognise a new emerging reality. Finding the optimal balance in order to ensure efficient execution, which is contingent on effectively managing change, is always a fundamental requirement, as is commonly stated. A compelling purpose can boost employee morale, performance, and motivation while also inspiring change and assisting the financial sector in cultivating a culture of trust and innovation.

The financial system underpins the whole economy and is therefore of paramount importance. If the country is to progress and realise its ambitions, the financial sector must undergo radical change. The sector's scale and resources make it well-positioned to rapidly adopt a more forward-looking mindset, creating a win-win situation in which to implement the transformational and long-term core strategies the country needs to overcome its current difficulties.

The failure of the financial services sector, however, might have negative effects on an economy (Investopedia, 2021). A downturn in the economy can follow. The economy takes a hit whenever there is a breakdown in the financial sector. As lending standards increase, access to capital becomes increasingly difficult. Rising joblessness and possibly falling earnings are having an effect on consumer spending.

IV. FUNCTIONS OF FINANCIAL INSTITUTIONS AS INTERMEDIARIES AHEAD OF THE PACK
The financial sector is a subset of the economy that consists of organisations and enterprises that provide financial services to both commercial and retail consumers. Mortgage and loan income accounts for a sizeable amount of this industry's revenue, which climbs as interest rates fall. According to Keister (2002), research on financial markets and banking in sociology is diverse, but it is connected by the notion that a financial market is a social system (Adler & Adler, 1984, Baker et al., 1998, Mizruchi & Stearns 1994b).

Enterprises that provide financial services have been immensely significant since the beginning of time because of the role they play in making monetary transactions easy for both individuals and enterprises. The value of the financial services industry in ensuring a country's economic health cannot be overstated (Kurt, 2022). The financial services industry was expected to account for around 24 percentage points of the global GDP by the end of 2021. The efficiency of the financial sector determines the overall health of the economy. The more robust the economy, the more secure the country.

V. DEVELOP THE STRATEGY

According to Van van Heijden (2005), large, well-managed businesses are especially vulnerable to strategic failures produced by a perception crisis during periods of rapid change. The risk increases as the rate of change increases. This is defined as being so engrossed in an outdated belief that one is unable to recognise a fresh, developing reality. As is widely noted, finding the appropriate balance in order to ensure efficient execution, which is dependent on properly managing change, is always a vital requirement.

A compelling mission can enhance employee morale, performance, and motivation while also motivating change and supporting the financial sector in developing a trust and innovation culture. The financial sector is the engine that drives all other sectors of the economy. The financial sector must undergo major transformation in order for the country to progress and accomplish its goals. Given its size, the sector has the ability, resources, and motivation to move faster into a forward-thinking paradigm, ensuring a win-win strategy for implementing transformational and sustainable core strategies to address the country's current challenges.

VI. THE AVAILABILITY OF FINANCIAL SERVICES

The importance of financial services cannot be overstated. They provide valuable inputs to the economy as infrastructure services, according to the United Nations Conference on Trade and Development (UNCTAD) (2015). Through banking, securities, and insurance services, financial services facilitate domestic and international transactions, mobilise and channel domestic savings, and increase credit availability for firms, including small and medium-sized enterprises (SMEs) and households.

As a separate part of the economy, financial services contribute to output and jobs, and many high-value-added activities need qualified workers. So, financial inclusion, which is defined as people and businesses being able to get and use available, affordable, convenient, high-quality, and long-term financial services from formal providers, can help reduce poverty and improve the economy and society.

The financial services industry has put up many barriers that make it hard to get products like loans. Banks need pay stubs and bank statements to approve loans, which can take a long time. This makes it hard for people with low incomes, who often need money on the same day but don't have these papers (Ikdal, 2017).

When borrowing money to get to work or buy food, the choice of channel is based on how flexible it is and how quickly it responds. Even though formal financial institutions have made progress in these areas, regulations make it hard for them to compete. As a result, when they need money, many South Africans turn to "mashonisas," or community loan sharks, or to friends and family.

The most recent survey by Statistics South Africa (Ikdal, 2017) found that more than 1.5 million South Africans ran small, unofficial businesses in 2013. These small businesses have a hard time meeting the standards of the formal financial sector. Banks need to be registered to open business bank accounts and give loans, but small business owners often can't afford to register, which makes it hard for them to use these services.

More people having access to financial services could help the economy grow, cut down on poverty, and give the private sector new market opportunities. So, making sure everyone has access to money is a key part of keeping the Rainbow Nation's promise. But South Africa needs a more creative way to bring people into the financial system. Even
though government rules can be helpful, financial institutions must work with both the private and public sectors.

VII. ECONOMIC INCLUSION MEASUREMENT

According to Bates (2016), when black-owned businesses are compared to white-owned enterprises, black-owned businesses have lower levels of capital, and black-owned businesses are more likely to fail over time. Banks are more likely to make smaller loans to black-owned firms than to white-owned businesses with the same measurable qualities.

Furthermore, black-firm borrowers use consumer credit far more than white borrowers, particularly credit cards. According to previous study, banks have been linked in the past to unfair treatment of black firms.

According to Keister (2002), who cites sociologist Simmel (1978), money is perceived as impersonal, and money plays a role in establishing and perpetuating estrangement. He said that money is an impersonal instrument of transaction with power because it allows people to control things they would not be able to control otherwise and to be things they would not be otherwise (1963). Marx predicted that money would pervade social life in 1964 and result in alienated social exchange in 1973.

VIII. MANAGING THE CHANGE- RELATED RISK

A lower level of firm ownership and commercial assets among Black households, according to Broady (2022), citing Fairlie, Robb, and Hinson (2010), contributes to the racial wealth discrepancy. The most significant impediment to the establishment, expansion, and growth of Black-owned businesses is a lack of capital.

Throughout the business-building process, black business owners face economic, commercial, societal, and institutional challenges, all of which are linked to racial discrimination in South Africa. Economic barriers are linked to disempowerment and the consequences of poor starting capital for individuals, families, and communities. Market obstacles arise from unmet requirements, which are frequently tied to issues of access—to cash, knowledge, and services. Sociocultural hurdles include the biased and exclusionary ways in which Black entrepreneurs are more likely to be prevented from obtaining social capital, such as beneficial contacts that comprise business networks.

Black entrepreneurs tend to make decisions that keep their businesses modest at the business-ideation stage. Black entrepreneurs are more likely to establish businesses in less profitable fields.

Crucially, Black entrepreneurs face greater challenges in obtaining capital and credit. Despite having great personal credit, Black business owners and other marginalised entrepreneurs are just about half as likely as their white counterparts to receive complete financing.

Given that the current government inherited an apartheid state machinery designed, on the one hand, to provide quality services to a privileged minority of the population while, on the other, to ensuring deliberate, systematic underdevelopment of the majority of South Africans (Pillay, 2000), common sense would suggest that fulfilling these promises was never going to be easy.

In this regard, a better understanding of the basic bases and causes of poverty, as well as the factors that exacerbate this issue within and outside the South African economy, can be extremely beneficial. Such an understanding can greatly aid policymakers by providing a starting point for the development of effective policy programmes targeted at improving the lives of the poor.

Efforts to encourage SMEs have been concentrated at the micro level (Motlatse, 2001), with minimal financial and non-financial assistance targeted at establishing a thriving small and medium sector with the ability to grow the economy and create jobs. In terms of financial service expansion, the focus has been on the regulatory environment and the protection of existing microfinance consumers; little attention has been paid to the formal banking sector or the creation of new institutions to deliver financial services on a large scale.

IX. MAKE A PLAN

According to Van van Heijden (2005), large, well-managed businesses are especially vulnerable to strategic failures produced by a perception crisis during periods of rapid change. The risk increases as the rate of change increases. This is defined as being so engrossed in an outdated belief that one is unable to recognise a fresh, developing reality. As is widely
noted, finding the appropriate balance in order to ensure efficient execution, which is dependent on properly managing change, is always a vital requirement.

A compelling mission can enhance employee morale, performance, and motivation while also motivating change and supporting the financial sector in developing a trust and innovation culture. The financial sector is the engine that drives all other sectors of the economy. The financial sector must undergo major transformation in order for the country to progress and accomplish its goals. Given its size, the sector has the ability, resources, and motivation to move faster into a forward-thinking paradigm, ensuring a win-win strategy for implementing transformational and sustainable core strategies to address the country’s current challenges.

However, a country’s economy may suffer if the financial services sector fails, according to Investopedia (2021). This could lead to a recession. The economy suffers when the financial system begins to fail. As lenders tighten their lending standards, capital begins to dry up. Rising unemployment and potentially decreased salaries have an impact on consumer purchasing.

X. CONCLUSION

As a result, the ongoing low level of black economic involvement implies that capital markets are unduly limited. Given the foregoing, it is appropriate to ask, “Are the government’s various anti-poverty strategies out of step with international best practises and thus insufficient to address the socioeconomic imbalances that continue to characterise South Africa?”

Worryingly, despite the aforementioned actions, there has only been a modest shift in the reduction of this issue thus far. Despite significant progress in other areas of development, current poverty estimates show that South Africa’s disadvantaged population remains at an unacceptably high level.

As Bates predicted in 2016, black-owned businesses continue to have less cash and are more likely to fail over time. Was it a premonition of the financial services industry’s reluctance to offer significant loans to black-owned businesses with comparable data to white-owned ones?

There must be some discrepancy between the mental model and the business model in the financial services sector. According to Hamel (2000), in the era of revolution, every organisation must become an opportunity-seeking missile, with the guidance system focusing on what is potential rather than what has been accomplished, if at all. With ruthless honesty, now is the moment to rise above the tragedy that is the circumstance and stand up for what is right.
